

Qualcomm Technologies, Inc.

# Telematics SDK

API Reference  
v1.46.67

80-79289-4 Rev. AA

July 26, 2024

# Revision history

---

<b>Revision</b>	<b>Date</b>	<b>Description</b>
AA	July 2024	Initial release

# Software Revision History

Date	Description
Sep 2017	Initial release
Dec 2017	Added subscription APIs and section on Versioning and API Status
Jun 2018	Added Cellular Connection Management APIs
Oct 2018	Addition of Network Selection and Serving System Management APIs and call flows
Nov 2018	Addition of C-V2X APIs
Jan 2019	Addition of Audio APIs and call flows
Mar 2019	Addition of Thermal manager APIs and call flows
May 2019	Addition of TCU Activity Management APIs and call flows
Jun 2019	Addition of Audio APIs for play, capture, DTMF and related call flows
Jul 2019	Updated the Location APIs and call flows
Jul 2019	Addition of Thermal shutdown manager APIs and call flows
Sep 2019	Addition of Remote SIM APIs and call flows
Sep 2019	Addition of Audio APIs for Loopback, Tone Generator and related call flows
Sep 2019	Addition of Audio APIs for compressed audio format playback and related call flows
Sep 2019	Addition of modem config APIs and related call flows
Oct 2019	Addition of Data Filter APIs and call flows
Oct 2019	Addition of Location concurrent report APIs and call flows
Oct 2019	Addition of Location constraint time uncertainty APIs and call flows
Nov 2019	Addition of Audio Format Transcoding APIs and call flows
Nov 2019	Addition of Data Networking APIs and call flows
Nov 2019	Addition of Compressed audio format playback on voice paths APIs and call flows
Jan 2020	Addition of Data software bridge management APIs and call flows
Jan 2020	Addition of Socks Proxy to Data Networking APIs and call flows
Feb 2020	Addition of Location Configurator APIs and call flows
Mar 2020	Addition of Robust Location API in Location Configurator and call flows
Apr 2020	Addition of Security section with SE-linux interface documentation
May 2020	Addition of L2TP to Data Networking APIs and call flows
May 2020	Addition of Public Logging API
Aug 2020	Addition of Location Manager APIs, Location Configurator APIs and callflows
Nov 2020	Addition of cv2x SE-linux interface documentation
Nov 2020	Addition of Year of hardware and configure engine state APIs in location and callflows
Jan 2021	Addition of terrestrial positioning APIs and callflows in location SDK
Jan 2021	Addition of Audio Subsystem Restart Support
Feb 2021	Addition of configure NMEA types in location SDK
Jan 2021	Updated Data Subsystem Readiness flow for new methodology
Feb 2021	Addition of new sub system Readiness APIs for Audio.
Mar 2021	Addition of calibration init status API for audio.
Apr 2021	Addition of Serving System Manager APIs for data.
Apr 2021	Addition of documentation for sensor subsystem.
Nov 2021	Support for Xtra feature in location.
Dec 2021	Addition of documentation for sensor self test APIs.
Jan 2022	Updated C-V2X radio call flows.
Jun 2021	Addition of documentation for platform subsystem.
Aug 2021	Added further EFS API related information for platform sub-system.

---

**Table 1 Revision history (cont.)**

<b>Date</b>	<b>Description</b>
Dec 2021	Addition of documentation for ECALL and OTA operation APIs
Mar 2022	Addition of documentation for Call flow of control filesystem for ECALL operation

# Contents

---

<b>1</b>	<b>Introduction</b>	<b>6</b>
1.1	Purpose	6
1.2	Scope	6
1.3	Conventions	6
1.4	SDK Versioning	6
1.5	Public API Status	7
<b>2</b>	<b>Functional Overview</b>	<b>8</b>
2.1	Overview	8
2.2	Features	10
2.2.1	Call Management	10
2.2.2	SMS	10
2.2.3	SIM Card Services	11
2.2.4	Phone Information	11
2.2.5	Location Services	11
2.2.6	Data Services	12
2.2.7	Network Selection and Serving System Management	13
2.2.8	C-V2X	13
2.2.9	Audio	14
2.2.10	Thermal Management	17
2.2.11	Thermal Shutdown Management	17
2.2.12	TCU Activity Management	17
2.2.13	Remote SIM	17
2.2.14	Modem Config Management	17
2.2.15	Sensors	18
2.2.16	Platform	18
2.2.17	Debug Logger	18
2.3	Security	18
2.3.1	SELinux	18
<b>3</b>	<b>Call Flow Diagrams</b>	<b>20</b>
3.1	Application initialization call flow	20
3.1.1	Phone manager initialization	20
3.2	Telephony	21
3.2.1	Dial call flow	21
3.2.2	ECall call flow	22
3.2.3	Signal strength call flow	24
3.2.4	Answer, Reject, RejectWithSMS call flow	25
3.2.5	Hold call flow	26

3.2.6	Hold, Conference, Swap call flow	27
3.2.7	SMS call flow	29
3.2.8	Radio and Service state call flow	30
3.2.9	Network Selection Manager call flow	31
3.2.10	Serving System Manager Call Flow	33
3.3	Card Services	34
3.3.1	Get applications call flow	35
3.3.2	Transmit APDU call flow	36
3.3.2.1	On logical channel	36
3.3.2.2	On basic channel	37
3.3.3	SAP card manager call flow	37
3.3.3.1	Request card reader status, Request ATR, Transmit APDU call flow	38
3.3.3.2	SIM Turn off, Turn on and Reset call flow	40
3.3.4	Subscription Call flow	41
3.3.4.1	Subscription initialization	42
3.3.4.2	Subscription call flow	43
3.4	Call flow for location services	44
3.4.1	Call flow to register/remove listener for generating basic reports	44
3.4.2	Call flow to register/remove listener for generating detailed reports	46
3.4.3	Call flow to register/remove listener for generating detailed engine reports	48
3.4.4	Call flow to register/remove listener for system info updates	49
3.4.5	Call flow to request energy consumed information	50
3.4.6	Call flow to get year of hardware information	51
3.4.7	Call flow to get terrestrial positioning information	51
3.4.8	Call flow to cancel terrestrial positioning information	52
3.4.9	Call flow to enable/disable constraint time uncertainty	52
3.4.10	Call flow to enable/disable PACE	53
3.4.11	Call flow to delete all aiding data	53
3.4.12	Call flow to configure lever arm parameters	54
3.4.13	Call flow to configure blacklisted constellations	54
3.4.14	Call flow to configure robust location	55
3.4.15	Call flow to configure min gps week	55
3.4.16	Call flow to request min gps week	56
3.4.17	Call flow to delete specified data	56
3.4.18	Call flow to configure min sv elevation	57
3.4.19	Call flow to request min sv elevation	57
3.4.20	Call flow to request robust location	58
3.4.21	Call flow to configure dead reckoning engine	58
3.4.22	Call flow to configure secondary band	59
3.4.23	Call flow to request secondary band	59
3.4.24	Call flow to configure engine state	60
3.4.25	Call flow to provide user consent for terrestrial positioning	60
3.4.26	Call flow to configure NMEA sentence type	61
3.4.27	Call flow to represent Xtra Feature	62
3.5	Data Services	63
3.5.1	Start/Stop for data connection manager call flow	64
3.5.2	Request data profile list call flow	66
3.5.3	Data Serving System Manager Call Flow	67
3.5.3.1	Get Dedicated Radio Bearer Call Flow	67

	3.5.3.2	Request Service Status Call Flow	68
	3.5.3.3	Request Roaming Status Call Flow	69
3.5.4		Data Filter Manager Call Flow	69
	3.5.4.1	Call flow to Set/Get data filter mode	70
	3.5.4.2	Call flow to Add data restrict filter	71
	3.5.4.3	Call flow to Remove data restrict filter	72
3.5.5		Data Networking Call Flow	73
	3.5.5.1	Create VLAN and Bind it to PDN in data vlan manager call flow	74
	3.5.5.2	LAN-LAN VLAN Configuration from EAP usecase call flow	75
	3.5.5.3	LAN-LAN VLAN Configuration from A7 usecase call flow	77
	3.5.5.4	LAN-WAN VLAN Configuration from EAP usecase call flow	78
	3.5.5.5	LAN-WAN VLAN Configuration from A7 usecase call flow	81
	3.5.5.6	Create Static NAT entry in data Static NAT manager call flow	83
	3.5.5.7	Firewall Enablement in data Firewall manager call flow	84
	3.5.5.8	Add Firewall Entry in data Firewall manager call flow	85
	3.5.5.9	Set Firewall DMZ in data Firewall manager call flow	86
	3.5.5.10	Socks Enablement in data Socks manager call flow	87
	3.5.5.11	L2TP Enablement and Configuration in data L2TP manager call flow	89
	3.5.5.12	Call flow to add and enable software bridge	91
	3.5.5.13	Call flow to remove and disable software bridge	92
3.6		C-V2X	93
	3.6.1	Retrieve/Update C-V2X Configuration	94
	3.6.2	Start/Stop C-V2X Mode	97
	3.6.3	C-V2X Radio Control Flow	99
	3.6.4	C-V2X Radio Initialization	102
	3.6.5	Get C-V2X Status	104
	3.6.6	Get C-V2X Capabilities	106
	3.6.7	C-V2X Radio RX Subscription	108
	3.6.8	C-V2X Radio TX Event Flow	111
	3.6.9	C-V2X Radio TX SPS flow	113
	3.6.10	C-V2X Throttle Manager Filer rate adjustment notification flow	115
	3.6.11	C-V2X Throttle Manager set verification load flow	115
	3.6.12	C-V2X TX Status Report	116
	3.6.13	C-V2X RX Meta Data	118
3.7		Audio	121
	3.7.1	Audio Manager API call flow	121
	3.7.2	Audio Voice Call Start/Stop call flow	123
	3.7.3	Audio Voice Call Device Switch call flow	125
	3.7.4	Audio Voice Call Volume/Mute control call flow	127
	3.7.5	Call flow to play DTMF tone	130
	3.7.6	Call flow to detect DTMF tones	132
	3.7.7	Audio Playback call flow	134
	3.7.8	Audio Capture call flow	136
	3.7.9	Audio Tone Generator call flow	138
	3.7.10	Audio Loopback call flow	140
	3.7.11	Compressed audio format playback call flow	142
	3.7.12	Audio Transcoding Operation Callflow	144
	3.7.13	Compressed audio format playback on Voice Paths Callflow	146
	3.7.14	Audio Subsystem Restart Callflow	148

3.7.15	Audio calibration configuration status	149
3.8	Thermal manager call flow	150
3.9	Thermal shutdown management	150
3.9.1	Call flow to register/remove listener for Thermal auto-shutdown mode updates.	151
3.9.2	Call flow to set/get the Thermal auto-shutdown mode	152
3.9.3	Call flow to manage thermal auto-shutdown from an eCall application.	153
3.10	TCU Activity Management	154
3.10.1	Call flow to register/remove listener for TCU-activity manager	155
3.10.2	Call flow to set the TCU-activity state in ACTIVE mode	156
3.10.3	Call flow to set the TCU-activity state in PASSIVE mode	157
3.11	Remote SIM call flow	158
3.12	Modem Config Call Flow	160
3.12.1	Call flow to load and activate a modem config file.	161
3.12.2	Call flow to deactivate and delete a modem config file.	162
3.12.3	Call flow to set and get config auto selection mode	163
3.13	Sensor	164
3.13.1	Call flow for sensor sub-system start-up	165
3.13.2	Call flow for sensor data acquisition	166
3.13.3	Call flow for sensor reconfiguration	168
3.13.4	Call flow for sensor sub-system cleanup	169
3.13.5	Call flow for sensor power control	170
3.13.6	Call flow for sensor feature control	171
3.13.7	Call flow for sensor self test	172
3.14	Platform	173
3.14.1	Call flow for EFS restore notification registration and handling	174
3.14.2	Call flow of control filesystem for ECALL operation	176
3.14.3	Call flow of control filesystem for OTA operation	177
<b>4</b>	<b>Deprecated List</b>	<b>179</b>
<b>5</b>	<b>Interfaces</b>	<b>185</b>
5.1	Telematics SDK APIs	185
5.2	tel	186
5.3	Phone Factory	187

3-125 Control the filesystem for ECALL operation call flow	176
3-126 Control the filesystem for OTA operation call flow	177

# 1 Introduction

---

## 1.1 Purpose

This document describes interface specification of Telematics Software Development Kit (SDK) for applications on Linux based automotive platforms.

## 1.2 Scope

Telematics SDK exposes a rich set of APIs conforming to C++11 standard which form the building blocks to create stand-alone Telematics applications.

This document provides high level overview of Telematics SDK architecture and its APIs. Call flow diagrams are provided for various APIs such as a Phone, Call, SMS, SIM Card Services, Audio, Location, Remote Sim, Modem configuration etc.

This document assumes that the developers are familiar with Linux and C++11 programming.

## 1.3 Conventions

Function declarations, function names, type declarations, and code samples appear in a different font. For example,

```
#include
```

Parameter directions are indicated as follows:

### Parameters

in	<i>paramname</i>	indicates an input parameter.
out	<i>paramname</i>	indicates an output parameter.
in, out	<i>paramname</i>	indicates a parameter used for both input and output.

Most APIs are asynchronous as underlying sub-systems such as telephony are asynchronous. API names follow the convention of using prefix " get " for synchronous calls and " request " for asynchronous calls. Asynchronous responses such as listener callbacks come on a different thread than the application thread.

## 1.4 SDK Versioning

The following convention is used for versioning the SDK releases

**SDK version (major.minor.patch)**

SDK\_VERSION = 1.0.0

**Major version:** This number will be incremented whenever significant changes or features are introduced.

**Minor version:** This number will be incremented when smaller features with some new APIs are introduced.

**Patch version:** If the release only contains bug fixes, but no API change then the patch version would be incremented, No change in the actual API interface.

**NOTE:** Use `telux::common::Version::getSdkVersion()` API to query the current version of SDK or refer the VERSION file in the repository

## 1.5 Public API Status

Public APIs are introduced and removed (if necessary) in phases. This allows users of an existing API that is being Deprecated to migrate. APIs will be marked with note indicating whether the API is subject to change or if it is not recommended to use the API.

as follows:

- **Eval:** This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.
- **Obsolete:** API is not preferred and a better alternative is available.
- **Deprecated:** API is not going to be supported in future releases. Clients should stop using this API. Once an API has been marked as Deprecated, the API could be removed in future releases.

# 2 Functional Overview

Figure 2-1 SDK-Overview

## 2.1 Overview

The Telematics library runs in the user space of the Linux system. It interacts with Telephony services and other sub-systems to provide various services like phone calls, SMS etc. These services are exposed by the SDK through fixed public APIs that are available on all Telematics platforms that support SDK. The Telematics APIs are grouped into the following functional modules:

### Telephony

Telephony sub-system consists of APIs for functions related to Phone, Call, SMS and Signal Strength, Network Selection and Serving System Management.

### SIM Card Services

SIM Card services sub-system consists of APIs to perform SIM card operations such as Send APDU messages to SIM card applications, SIM Access Profile(SAP) operations etc.

### Location Services

Location Services sub-system consists of APIs to receive location details such as GNSS Positions, Satellite Vehicle information, Jammer Data signals, nmea and measurements information. The location manager sub-system also consists of APIs to get location system info, request energy consumed, get year of hardware information, get terrestrial position information and cancel terrestrial position information.

LocationConfigurator allows general engine configurations (example: TUNC, PACE etc), configuration of specific engines like SPE (example: minSVElevation, minGPSWeek etc) or DRE, deletion of warm and cold aiding data, NMEA configuration and support for XTRA feature.

### **Connection Management**

Connection Management sub-system consists of APIs for establishing Cellular WAN/ Backhaul connection sessions and for Connection Profile Management etc.

### **Audio Management**

Audio Management sub-system consists of APIs for Audio management such as setting up audio streams, switching devices on streams, apply volume/mute etc

### **Thermal Management**

Thermal Management sub-system consists of APIs to get list of thermal zones, cooling devices and binding information.

### **Thermal Shutdown Mangement**

Thermal shutdown management sub-system consists of APIs to get/set the thermal auto-shutdown mode and listen to its updates.

### **TCU Activity Management**

TCU Activity Management sub-system consists of APIs to get TCU-activity state updates, set the TCU-activity state, etc.

### **Remote SIM Services**

Remote SIM sub-system consists of APIs that allow a device that does not have a SIM physically connected to it to access a SIM remotely (e.g. over BT, Ethernet, etc.) and perform card operations on that SIM, such as requesting reset, transmitting APDU messages, etc.

### **Modem Config Services**

Modem Config sub-system consists of APIs that allow to request modem config files, load/delete a modem config file from modem's storage, activate/deactivate a modem config file, get/set auto selection mode for config files.

### **Data Network Management**

Data Network Management sub-system consists of APIs to setup VLAN, static NAT, Firewall, Socks, etc.

### **Sensor services**

The sensor sub-system provides API to configure and acquire data from underlying hardware sensors like accelerometers, gyroscopes among others.

### **Platform services**

The platform sub-system provides APIs to configure and control platform functionalities, like starting an EFS backup, control filesystem for ECALL and OTA operations. This sub-system also provides notifications about certain system related events, for instance filesystem events such as EFS restore and backup events.

### **Debug Logger**

Logger consists of API that can be utilized to log messages from SDK Applications.

Telematics SDK classes can be broadly divided into the following types:

- Factory - Factory classes are central classes such as PhoneFactory which can be used to create Manager classes corresponding to their sub-systems such as PhoneManager.
- Manager - Manager classes such as PhoneManager to manage multiple Phone instances, CardManager to manage multiple SIM Card instances etc.
- Observer/ Listener - Listener for unsolicited responses.
- Command Callback - Single-shot response callback for asynchronous API requests.
- Logger - APIs to log messages, control the log levels.

## 2.2 Features

Telematics SDK provides APIs for the following features:

### 2.2.1 Call Management

CallManager, Phone and PhoneManager APIs of Telematics SDK provides call related control operations such as

- Initiate a voice call
- Answer the incoming call
- Hold the call
- Hangup waiting, held or active call

CallManager and PhoneManager also provides additional functionality such as

- Allowing conference, and switch between waiting or holding call and active call
- Emergency Call (dial 112)
- Notifications about call state change

### 2.2.2 SMS

SMS Manager APIs of Telematics SDK provides SMS related functionality such as

- Sends and receives SMS messages of type GSM7, GSM8 and UCS2

### 2.2.3 SIM Card Services

The SIM Card operations are performed by CardManager and SapCardManager.

CardManager APIs of Telematics SDK perform operations on UICC card such as

- Open or close logical/basic channel to ICC card
- Transmit Application Protocol Data Unit (APDU) to the ICC Card over logical/basic channel
- Receive response APDU from the ICC Card with the status
- Notify about ICC card information change

SapCardManager APIs provides SIM Access Profile(SAP) related functionality such as

- Open or close SIM Access Profile(SAP) connection
- Transmit Application Protocol Data Unit (APDU) over SAP connection
- Receive response APDU over SAP connection
- Perform SAP operations such as Answer to Reset(ATR), SIM Power off, SIM Power On, SIM Reset and fetch Card Reader status.

### 2.2.4 Phone Information

Phone APIs of Telematics SDK provides phone related information such as

- Get Service state of phone i.e. EMERGENCY\_ONLY, IN\_SERVICE and OUT\_OF\_SERVICE
- Get Radio state of device i.e RADIO\_STATE\_OFF, RADIO\_STATE\_ON and RADIO\_STATE\_UNAVAILABLE
- Retrieve the signal strength corresponding to the technology supported by SIM
- Device Identity
- Set or Request Operating Mode
- Subscription Information

### 2.2.5 Location Services

Location Services APIs of Telematics SDK provide the mechanism to register listener and to receive location updates, satellite vehicle information, jammer signals, nmea and measurement updates. The location manager sub-system also consists of APIs to get location system info, request energy consumed, get year of hardware information, get terrestrial position information and cancel terrestrial position information. Following parameters are configurable through the APIs.

- Minimum time interval between two consecutive location reports.
- Minimum distance travelled after which the period between two consecutive location reports depends on the interval specified.

LocationConfigurator allows general engine configurations (example: TUNC, PACE etc),configuration of specific engines like SPE (example: minSVElevation, minGPSWeek etc) or DRE, deletion of warm and cold aiding data, NMEA configuration and support for XTRA feature.

## 2.2.6 Data Services

Data Services APIs in the Telematics SDK used for cellular connectivity, modem profile management, filters management, and networking.

Data Connection Manager APIs provide functionality such as

- start / stop data call
- listen for data call state changes

Data Profile Manager APIs provide functionality such as

- List available profiles in the modem
- Create / modify / delete / modify modem profiles
- Query for the selected profile

Data Serving System Manager APIs provide functionality such as

- Get dedicated radio bearer status
- Request Modem Service Status
- Request Modem Roaming Status

Data Filter Manager APIs provide functionality such as

- get / set data filter mode per data call
- get / set data filter mode for all data call in up state
- add / remove data filter per data call
- add / remove data filter for all data call in up state

Data VLAN Manager APIs provide functionality such as

- Create / remove VLAN
- Query VLAN info
- Bind / unbind VLAN to PDN
- Query current VLAN to PDN mapping

Data Static LAN Manager APIs provide functionality such as

- Add / remove static LAN entry
- Request current static NAT entries

Data Firewall Manager APIs provide functionality such as

- Add / remove DMZ entry
- Query current DMZ entries
- Set Firewall configuration to enable / disable Firewall
- Query current status of Firewall
- Add / remove Firewall entry

- Query Firewall entry rules

Data Socks Manager APIs provide functionality such as

- Enable/Disable Socks feature

Data L2TP Manager APIs provides functionality such as

- Set L2TP configuration to enable/disable L2TP, TCP Mss and MTU size
- Add / remove L2TP tunnel
- Query active L2TP configuration

Data Software Bridge Manager provides interface to enable packet acceleration for non-standard WLAN and Ethernet physical interfaces. It facilitates to configure a software bridge between the interface and Hardware accelerator. Its APIs provide functionality such as

- Add / remove a software bridge
- Query the software bridges configured in the system
- Enable / Disable the software bridge management

Data client Manager APIs provide functionality such as

- fetch device data usage Configurations relevant to device data usage monitoring are available in data related configuration files - /etc/data/mobileap\_cfg.xml and /etc/data/ipa/IPACM\_cfg.xml

## 2.2.7 Network Selection and Serving System Management

Network Selection and Service System Management APIs in the Telematics SDK used for configuring the networks and preferences

Network Selection Manager APIs provide functionality such as

- request or set network selection mode (Manual or Automatic)
- scan for available networks
- request or set preferred networks list

Serving System Manager APIs provide functionality such as

- request and set service domain preference and radio access technology mode preference for searching and registering (CS/PS domain, RAT and operation mode)

## 2.2.8 C-V2X

The C-V2X sub-system contains APIs that support Cellular-V2X operation.

Cellular-V2X APIs in the Telematics SDK include Cv2xRadioManager and Cv2xRadio interfaces.

Cv2xRadioManager provides an interface to a C-V2X capable modem. The API includes methods for

- Enabling C-V2X mode
- Disabling C-V2X mode
- Querying the status of C-V2X

- Updating the C-V2X configuration via a config XML file

Cv2xRadio abstracts a C-V2X radio channel. The API includes methods for

- Obtaining the current capabilities of the radio
- Listen for radio state changes
- Creating and Closing an RX subscription
- Creating and Closing a TX event-driven flow
- Creating and Closing a TX semi-persistent-scheduling (SPS) flow
- Updating TX SPS flow parameters
- Update Source L2 Info

## 2.2.9 Audio

The Audio subSystem contains of APIs that support Audio operation.

Audio APIs in the Telematics SDK include AudioManager, AudioStream, AudioVoiceStream, AudioPlayStream, AudioCaptureStream interfaces.

AudioManager provides an interface for creation/deletion of audio stream. The API includes methods for

- Query readiness of subSystem
- Query supported "Device Types"
- Query supported "Stream Types"
- Creating Audio Stream
- Deleting Audio Stream

AudioStream abstracts the properties common to different stream types. The API includes methods for

- Query stream type
- Query routed device
- Set device
- Query volume details
- Set volume
- Query mute details
- Set mute

AudioVoiceStream along with inheriting AudioStream, provides additional APIs to manage voice call session as stated below.

- Start Voice Audio Operation
- Stop Voice Audio Operation
- Play DTMF tone
- Detect DTMF tone

AudioPlayStream along with inheriting AudioStream, provides additional APIs to manage audio play session as stated below.

- write audio samples
- Write audio samples for compressed audio format
- Stop Audio for compressed audio format
- Play compressed format audio on voice paths

AudioCaptureStream along with inheriting AudioStream, provides additional APIs to manage audio capture session as stated below.

- read audio samples

AudioLoopbackStream along with inheriting AudioStream, provides additional APIs to manage audio loopback session as stated below.

- Start loopback
- Stop loopback

AudioToneGeneratorStream along with inheriting AudioStream, provides additional APIs to manage audio tone generator session as stated below.

- Play tone
- Stop tone

Transcoder provides APIs to manage audio transcoder which is able to perform below operations.

- Convert one audio format to another

Audio SDK provides details of Supported "Device Types" and "Stream Types" in the Audio subSystem of Reference Telematics platform.

“Device Type” encapsulates the type of device supported in Reference Telematics platform. The representation of these devices would be made available via public header file <usr/include/telux/audio/AudioDefines.hpp>.

Example: DEVICE\_TYPE\_XXXX

Internally SDK Device Type mapped to Audio HAL devices as per <usr/include/system/audio.h>.

In current release it is mapped per below table.

**Current Device Mapping Table:**

SDK Audio Device Representation	Audio HAL Representation
DEVICE_TYPE_SPEAKER	AUDIO_DEVICE_OUT_SPEAKER
DEVICE_TYPE_MIC	AUDIO_DEVICE_IN_BACK_MIC

However Device Mapping configurable as stated below. This configurability provides flexibility to map different Audio HAL devices to SDK representation.

Update tel.conf file with below details before boot of system.

NUM\_DEVICES specifies the number of device types supported

DEVICE\_TYPE specifies the SDK type of each device (in comma separated values)

DEVICE\_DIR specifies the device direction for each device in order above (in comma separated values)

AHAL\_DEVICE\_TYPE specifies the mapped Audio HAL type of each device (in comma separated values)

Example:

Note: The default values provided here are based on QTI's reference design.

NUM\_DEVICES=6

DEVICE\_TYPE=1,2,3,257,258,259

DEVICE\_DIR=1,1,1,2,2,2

AHAL\_DEVICE\_TYPE=2,1,4,2147483776,2147483652,2147483664

For any stream types, maximum device supported would be one. Single stream per multiple devices not supported. For voice stream Rx Device would decide corresponding Tx Device pair as decided by Audio HAL.

#### **NOTE FOR SYSTEM INTEGRATORS:**

The mapping of Audio devices to Audio HAL devices is static currently based on QTI's Reference Telematics platform. For custom platforms this mapping need to be updated.

“Stream Type” encapsulates the type of stream supported in Reference Telematics Platform. The representation of these stream types made available via public header file <usr/include/telux/audio/AudioDefines.hpp>.

Example: VOICE\_CALL, PLAY, CAPTURE etc

#### **Volume Support Table:**

This table captures scenarios where the volume could be modified.

Stream Type	Stream Direction (RX)	Stream Direction (Tx)
VOICE_CALL	Applicable	Not Applicable
PLAY	Applicable	Not Applicable
CAPTURE	Not Applicable	Applicable
LOOPBACK	Not Applicable	Not Applicable
TONE_GENERATOR	Not Applicable	Not Applicable

In case QTI's reference design does not support volume for specific stream category, API responds with error.

#### **Mute Support Table:**

This table captures when stream could be muted and in which direction.

Stream Type	Stream Direction (RX)	Stream Direction (Tx)
VOICE_CALL	Applicable	Applicable
PLAY	Applicable	Not Applicable
CAPTURE	Not Applicable	Applicable
LOOPBACK	Not Applicable	Not Applicable
TONE_GENERATOR	Not Applicable	Not Applicable

In case QTI's reference design does not support mute for specific stream category, API responds with error.

## 2.2.10 Thermal Management

Thermal Management APIs in the Telematics SDK are used for reading thermal zone, cooling device and binding information.

Thermal Management APIs provide functionality such as

- get thermal zones with thermal zone description, current temperature, trip points and binding info
- get cooling devices with cooling device type, maximum and current cooling level
- get thermal zone by Id
- get cooling device by Id

## 2.2.11 Thermal Shutdown Management

Thermal Shutdown Management APIs provide functionality such as

- Query auto-shutdown mode.
- Set auto-shutdown mode.
- Get notifications on auto-shutdown mode updates.

## 2.2.12 TCU Activity Management

TCU-activity Manager APIs in Telematics SDK provides TCU-activity state related operations such as

- Query the current TCU-activity state
- Get notifications about the TCU-activity state changes
- Set the system to a desired activity state

## 2.2.13 Remote SIM

Remote SIM APIs in the Telematics SDK allow a device to use the WWAN capabilities of a SIM on another device.

Remote SIM APIs provide functionality such as

- Sending card events (reset, power up, errors) to the modem
- Sending/receiving APDU messages from/to the modem and remote SIM.
- Receiving operations from the modem (disconnect, power up, reset) to the remote SIM.

## 2.2.14 Modem Config Management

Modem Config APIs in the Telematics SDK provides modem config related functionalities such as

- Request modem config files from modem's storage.
- Load a modem config file to modem's storage.

- Activate/Deactivate a modem config file from modem's storage.
- Get Active config info details.
- Get/Set config auto selection mode.
- Delete a modem config file from modem's storage.
- Ability to get notified whenever a SW config file is activated.

## 2.2.15 Sensors

The sensor sub-system provides APIs to

- Configure and acquire continuous stream of data from an underlying sensor
- Create multiple clients for a given sensor, each of which can have their own configuration (sampling rate, batch count) for data acquisition.
- Query and control sensor features available on the hardware or those offered by the software framework. Availability of sensor features depend on the sensor hardware being used and the capabilities it offers.

In addition to the sensor sub-system APIs, configuration items relevant to the underlying sensors are also available in `/etc/sensors.conf` on the device filesystem. This includes the range for the sensors, the limits on sampling frequency and batch count among other parameters.

## 2.2.16 Platform

The platform sub-system provides APIs to

- Register and listen to filesystem events such as EFS backup and restore notifications
- Request EFS backup

## 2.2.17 Debug Logger

Logging APIs in the Telematics SDK provides logging related functionalities such as

- Runtime configurable logging to console, diag and file.
- Possible `LOG_LEVEL` values are NONE, PERF, ERROR, WARNING, INFO, DEBUG.

## 2.3 Security

### 2.3.1 SELinux

SELinux is an access control framework provided by the Linux kernel. It provides a mechanism to restrict/control access to system resources such as file nodes and sockets. SELinux framework expects any process running in userspace to declare all its interactions with the system resources in the form of SELinux policies. On platforms enabled with SELinux, an app that uses an SDK API would also need to declare its usage through SELinux policies to ensure that it has all the required permissions. In order for an application to use the SDK's APIs on such a platform, SELinux interfaces have been defined that the app needs to declare in its policies.

Listed below are the interfaces to be used when an app uses APIs belonging to a given namespace/class of the SDK.

**Note** For the below list, let us consider the application's security context to be `app_t` (also called domain context).

SDK Namespace/Class	SELinux interface	Arguments	Usage
tel	telux_allow_tel()	domain context	telux_allow_tel(app_t)
data	telux_allow_data()	domain context	telux_allow_data(app_t)
audio	telux_allow_audio()	domain context	telux_allow_audio(app_t)
loc	telux_allow_loc()	domain context	telux_allow_loc(app_t)
IThermalManager	telux_allow_↔ thermalmanager()	domain context	telux_allow_↔ thermalmanager(app_t)
IThermalShutdown↔ Manager	telux_allow_↔ thermalshutdown()	domain context	telux_allow_↔ thermalshutdown(app_t)
power	telux_allow_power()	domain context	telux_allow_power(app↔ _t)
config	telux_allow_↔ modemconfig()	domain context	telux_allow_↔ modemconfig(app_t)
cv2x	telux_allow_v2x()	domain context	telux_allow_v2x(app_t)
sensor	telux_allow_sensor()	domain context	telux_allow_sensor(app↔ _t)
platform	telux_allow_platform()	domain context	telux_allow_↔ platform(app_t)

The following example illustrates how an application can incorporate the SELinux interfaces exposed by SDK in its SELinux policies. Below code snippet is part of a Type Enforcement (TE) file of the application which grants required permissions to perform all SDK data operations.

```
policy_module(application, 1.0)
type app_t;

#Granting SDK data client permissions to the application

telux_allow_data(app_t);
```

# 3 Call Flow Diagrams

## 3.1 Application initialization call flow

TelSDK initializes various sub-systems during start-up. It marks each sub-system as ready once the initialization procedures are completed for that sub-system. The application has to wait until the corresponding sub-system is ready on which it needs to make API requests. TelSDK provides APIs to check whether sub-system is ready or not.

Example:

### 3.1.1 Phone manager initialization

Figure 3-1 Phone manager initialization

1. Application can use iPhoneManager::isSubsystemReady to determine if the system is ready.
2. The application receives the status i.e. either true or false whether sub-system is ready or not.

3. If it is not ready, then the application could use `onSubsystemReady` which returns `std::future`.
4. `PhoneManager` notifies the application when the subsystem is ready through the `std::future` object.
5. The application waits until the asynchronous operation i.e `onSubsystemReady` completes.
6. `PhoneManager` updates the application once sub-system initialization completes.

## 3.2 Telephony

### 3.2.1 Dial call flow

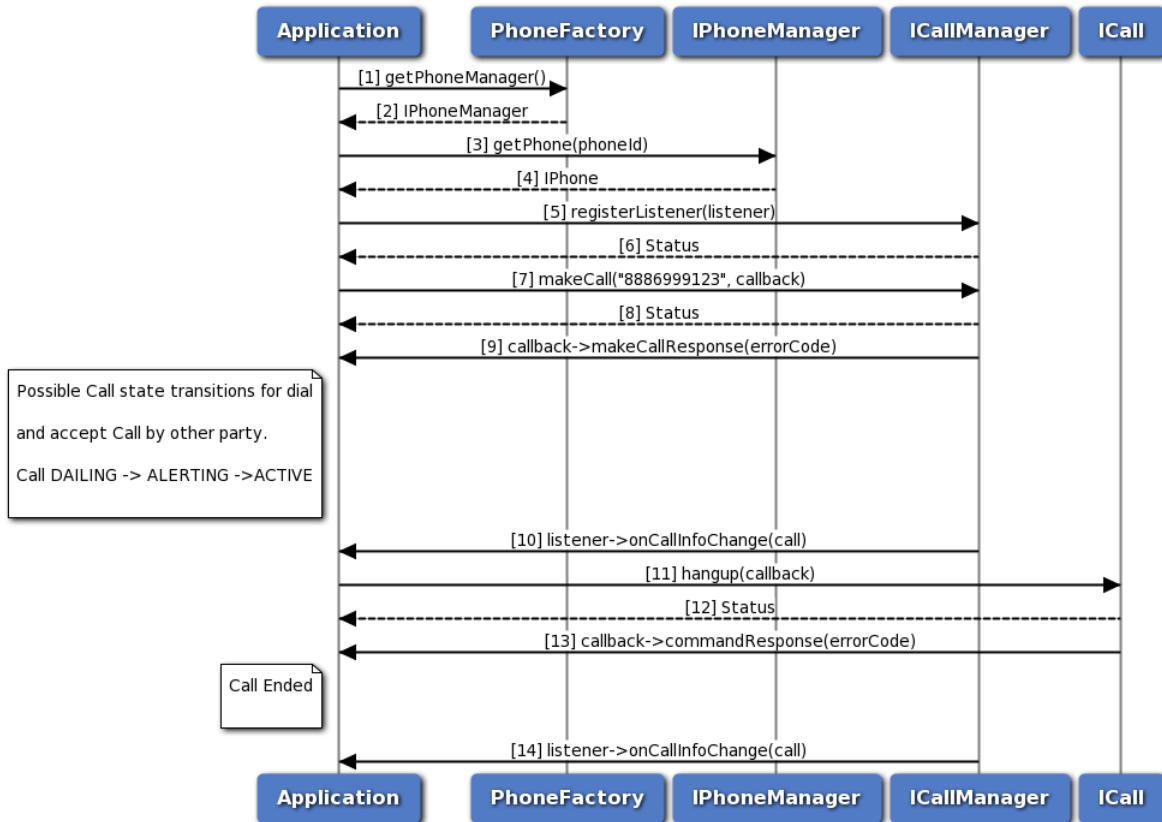

Figure 3-2 Dial call flow

1. The application gets the `PhoneManager` object using `PhoneFactory`.
2. The application receives the `PhoneManager` object in order to get `Phone`.
3. The application gets the `Phone` object for given phone identifier using `PhoneManager`.
4. `PhoneManager` returns `Phone` object to application. In case phone identifier is not specified, it returns default phone.
5. The application registers a listener with `CallManager` to listen to the call info change notifications like `DIALING`, `ALERTING`, `ACTIVE` and `ENDED`.
6. The application receives the status like `SUCCESS` or `INVALIDPARAM` based on registration of listener to `CallManager`.

7. The application dials a number by using makeCall API, optionally specifying callback to get asynchronous response.
8. The application receives the status like SUCCESS, INVALIDPARAM and FAILED etc based on the execution of makeCall API.
9. Optionally, the application gets asynchronous response for makeCall using makeCallResponseCallback.
10. The application receives callback on call info change like DIALING/ALERTING/ACTIVE when other party accepts the call.
11. The application sends hangup command to hangup the call, optionally specifying callback to get asynchronous response.
12. The application receives the status like SUCCESS, FAILED etc based on the execution of hangup API.
13. Optionally, the application gets asynchronous response for hangup using CommandResponseCallback.
14. The application receives callback on call info change i.e Call Ended from CallManager.

### 3.2.2 ECall call flow

Figure 3-3 ECall call flow

1. The application gets the PhoneManager object using PhoneFactory.

2. The application receives the PhoneManager object in order to get Phone.
3. The application gets the Phone object optionally specifying phone identifier using PhoneManager.
4. PhoneManager returns Phone object to application, returns default phone in case phone identifier is not specified.
5. The application registers a listener with CallManager to listen to the call info change notifications like DIALING, ALERTING, ACTIVE etc.
6. The application receives the status like SUCCESS, FAILED etc based on registration of listener from CallManager.
7. The application dials an emergency call by using makeECall API, optionally specifying callback to get asynchronous response.
8. The application receives the status like SUCCESS, FAILED etc based on the execution of makeECall API.
9. Optionally, the application gets asynchronous response for makeECall using makeCallResponseCallback.
10. CallManager sends ecall msd transmission status to the application by using onECallMsdTransmissionStatus API.
11. The application sends hangup command to hangup the call, optionally gets asynchronous response using callback.
12. The application receives the status like SUCCESS, FAILED etc based on the execution of hangup API.
13. Optionally, the application gets asynchronous response for hangup using CommandResponseCallback.
14. CallManager sends call info change i.e Call Ended to the application by using onCallInfoChange callback function.

### 3.2.3 Signal strength call flow

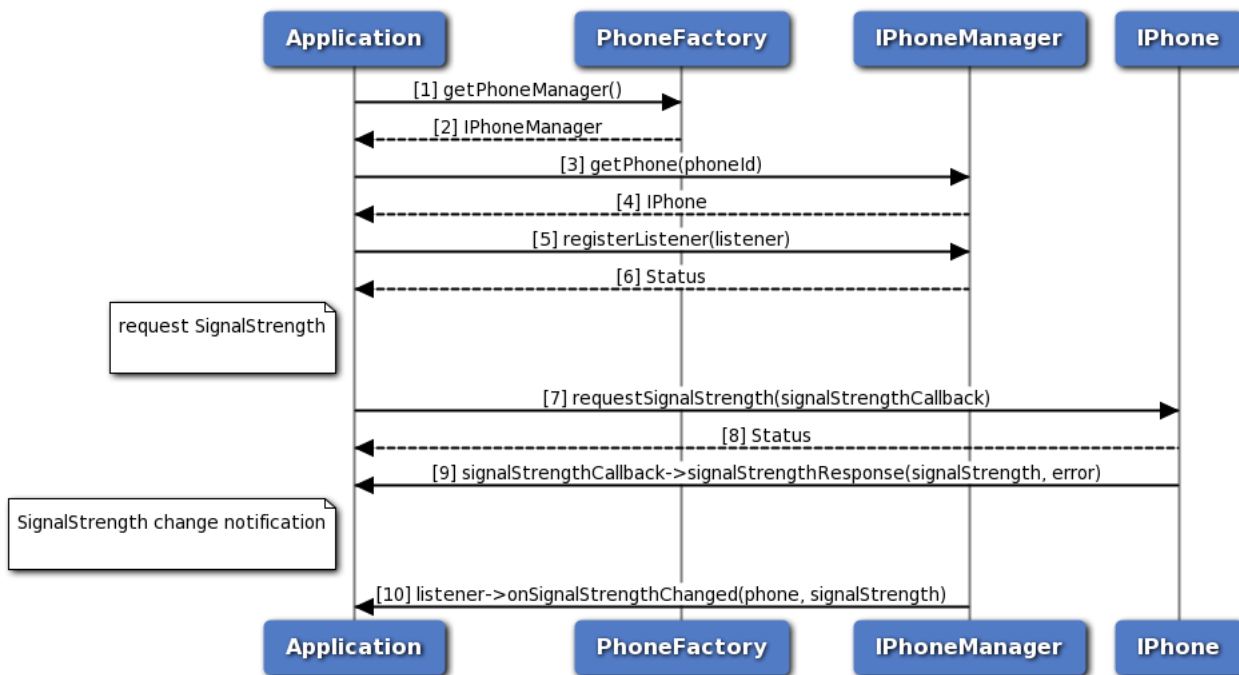

Figure 3-4 Signal strength call flow

1. The application gets PhoneManager object using PhoneFactory.
2. The application receives the PhoneManager object in order to get Phone instance.
3. The application gets phone instance for a given phone identifier using PhoneManager object.
4. PhoneManager returns iPhone object to the application.
5. Application registers the listener to get notification for signal strength change.
6. The application receives the status i.e. either SUCCESS or FAILED based on the registration of the listener.
7. The application requests for signal strength and optionally, gets asynchronous response using ISignalStrengthCallback.
8. The application receives the status i.e. either SUCCESS or FAILED based on execution of requestSignalStrength API in SapCardManager.
9. Optionally, the response for signal strength request is received by the application.
10. Application receives a notification when there is a change in signal strength.

### 3.2.4 Answer, Reject, RejectWithSMS call flow

Figure 3-5 Answer, Reject, RejectWithSMS call flow

1. The application gets the PhoneManager object using PhoneFactory.
2. The application receives the PhoneManager object in order to register listener.
3. The application registers a listener with CallManager to listen incoming call notifications.
4. The application receives the status like SUCCESS, FAILED etc based on registration of listener from CallManager.
5. The application receives `onIncomingCall` notification when there is an incoming call.
6. The application performs `answer/reject/rejectWithSMS` operation using ICall.
7. The application receives the status like SUCCESS, FAILED etc based on execution of `answer/reject/rejectWithSMS`.
8. Optionally, the application gets asynchronous response for `answer/reject/rejectWithSMS` using `CommandResponseCallback`.
9. The CallManager sends call info change i.e `CALL_ACTIVE` or `CALL_ENDED` to the application by using `onCallInfoChange` callback function.

### 3.2.5 Hold call flow

**Figure 3-6 Hold call flow**

1. The application gets the PhoneManager object using PhoneFactory.
2. The application receives the PhoneManager object in order to get Phone.
3. The application gets the Phone object for given phone identifier using PhoneManager.
4. PhoneManager returns Phone object to application, returns default phone in case phone identifier is not specified.
5. The application registers a listener with CallManager to listen to the call info change notifications like DIALING, ALERTING, ACTIVE etc.
6. The application receives the status like SUCCESS or INVALIDPARAM based on registration of listener to CallManager.
7. The application dials a number by using makeCall API, optionally specifying callback to get asynchronous response.
8. The application receives the status like SUCCESS, INVALIDPARAM and FAILED etc based on the execution of makeCall API.
9. Optionally, the application gets asynchronous response for makeCall using makeCallResponseCallback.
10. The CallManager sends call info change i.e CALL\_ACTIVE to application by using onCallInfoChange API.
11. The application sends hold command to hold the call, optionally specifying callback to get asynchronous response.
12. The application receives the status like SUCCESS, FAILED etc based on the execution of hold API.
13. Optionally, the application gets asynchronous response for hold using CommandResponseCallback.
14. The application receives call info change i.e CALL\_ON\_HOLD from CallManager.

### 3.2.6 Hold, Conference, Swap call flow

Figure 3-7 Hold, Conference, Swap call flow

1. The application makes first call using ICall.
2. The application receives the status like SUCCESS, FAILED etc based on execution of makeCall operation.
3. Optionally, the application gets asynchronous response for makeCall using makeCallResponseCallback.
4. The CallManager sends call info change i.e CALL\_ACTIVE to application by using onCallInfoChange API.
5. The application sends hold command to hold the call, optionally specifying callback to get

- asynchronous response.
6. The application receives the status like SUCCESS, FAILED etc based on the execution of hold API.
  7. Optionally, the application gets asynchronous response for hold using CommandResponseCallback.
  8. The application receives call info change i.e CALL\_ON\_HOLD from CallManager.
  9. The application makes second call using ICall.
  10. The application receives the status like SUCCESS, FAILED etc based on execution of makeCall operation.
  11. Optionally, the application gets asynchronous response for makeCall using makeCallResponseCallback.
  12. The CallManager sends call info change i.e CALL\_ACTIVE to application by using onCallInfoChange API.
  13. The application requests the PhoneFactory to get ICallManager object.
  14. The application receives the ICallManager object using PhoneFactory.
  15. The application performs conference/swap operation using ICallManager by passing first call and second call. optionally application can pass callback to receive hold response asynchronously.
  16. The application receives the status like SUCCESS, FAILED etc based on the execution of conference/swap API.
  17. Optionally, the application gets asynchronous response for conference/swap using CommandResponseCallback.

### 3.2.7 SMS call flow

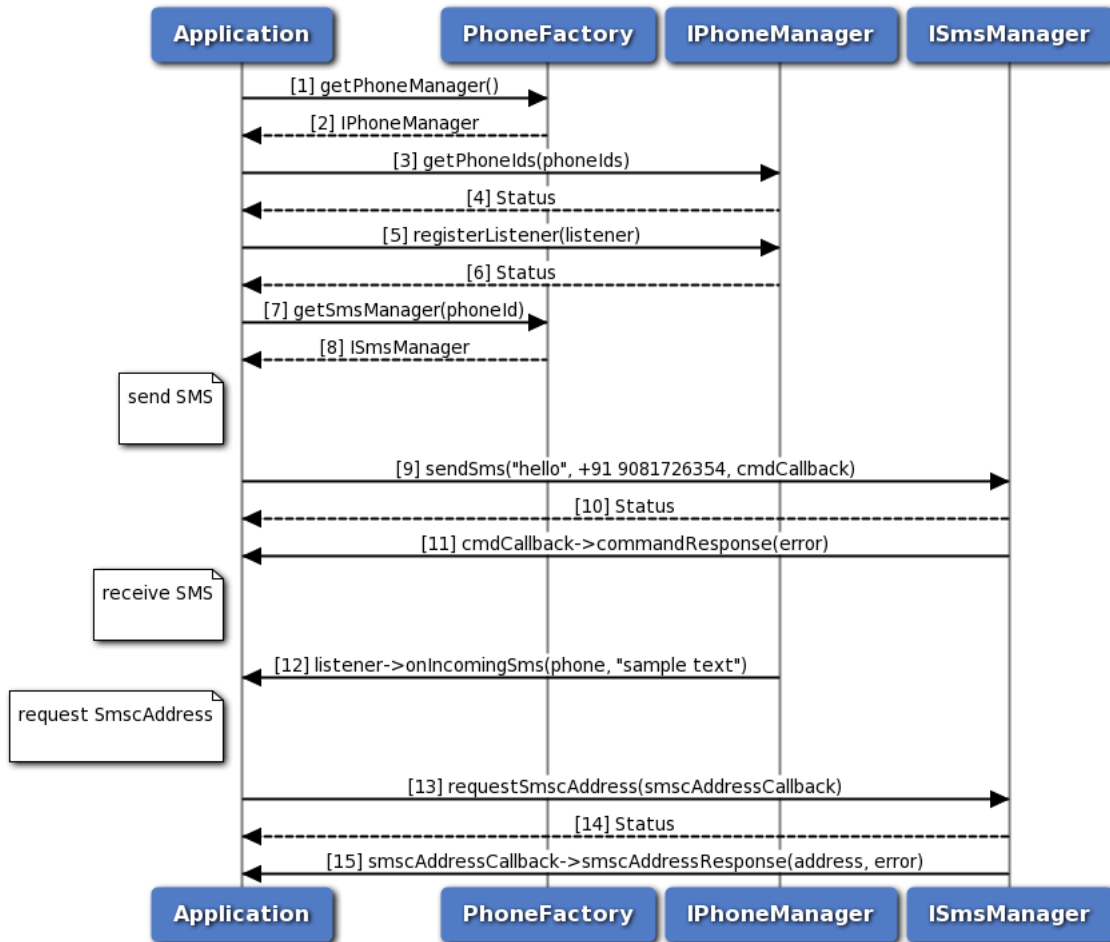

Figure 3-8 SMS call flow

1. Application gets PhoneManager object using PhoneFactory.
2. PhoneFactory returns the PhoneManager object to application in order to get list of phone identifiers.
3. The application retrieves the list of phone identifier on the device using PhoneManager object.
4. Application receives the status i.e. either SUCCESS or FAILED based on the execution of getPhoneIds API in PhoneManager.
5. Application registers the listener for incoming SMS with IPhoneManager.
6. The application receives the status i.e. either SUCCESS or INVALIDPARAM based on successful registration of the listener.
7. The application gets SmsManager object corresponding to specific phone identifier.
8. PhoneFactory returns the SmsManager object to application in order to perform operations like send SMS and get SMSC address.
9. The application sends SMS to the receiver address and optionally gets asynchronous response using CommandResponseCallback.
10. Application receives the status i.e. either SUCCESS or FAILED based on execution of sendSms API

in SmsManager.

11. Optionally, the response for send SMS is received by the application.
12. Application gets notified for incoming SMS.
13. The application requests for SmscAddress and optionally gets asynchronous response using ISmscAddressCallback.
14. Application receives the status i.e. either SUCCESS or FAILED based on successful execution of requestSmscAddress API in SmsManager.
15. Optionally, the application receives the SMSC address on success or gets error on failure in the command response callback.

### 3.2.8 Radio and Service state call flow

Figure 3-9 Radio and Service state call flow

1. The application gets PhoneManager object using PhoneFactory.
2. The application receives the PhoneManager object in order to get Phone instance.
3. The application gets phone instance for a given phone identifier using PhoneManager object.
4. PhoneManager returns IPhone object to the application.
5. Application registers the listener to get notifications for radio and service state change.
6. The application receives the status i.e. either SUCCESS or FAILED based on the registration of the listener.
7. The application request the Phone to get radio state.

8. The application receives the radio state like RADIO\_STATE\_ON, OFF or UNAVAILABLE.
9. Application receives a notification when there is a change in radio state.
10. The application request the Phone to get service state.
11. The application receives the service state like IN\_SERVICE, OUT\_OF\_SERVICE, EMERGENCY\_ONLY or RADIO\_OFF.
12. Application receives a notification when there is a change in service state.

### 3.2.9 Network Selection Manager call flow

Network selection manager provides APIs to get and set network selection mode, get and set preferred networks and perform network scan for available networks. Registered listener will get notified for the change in network selection mode.

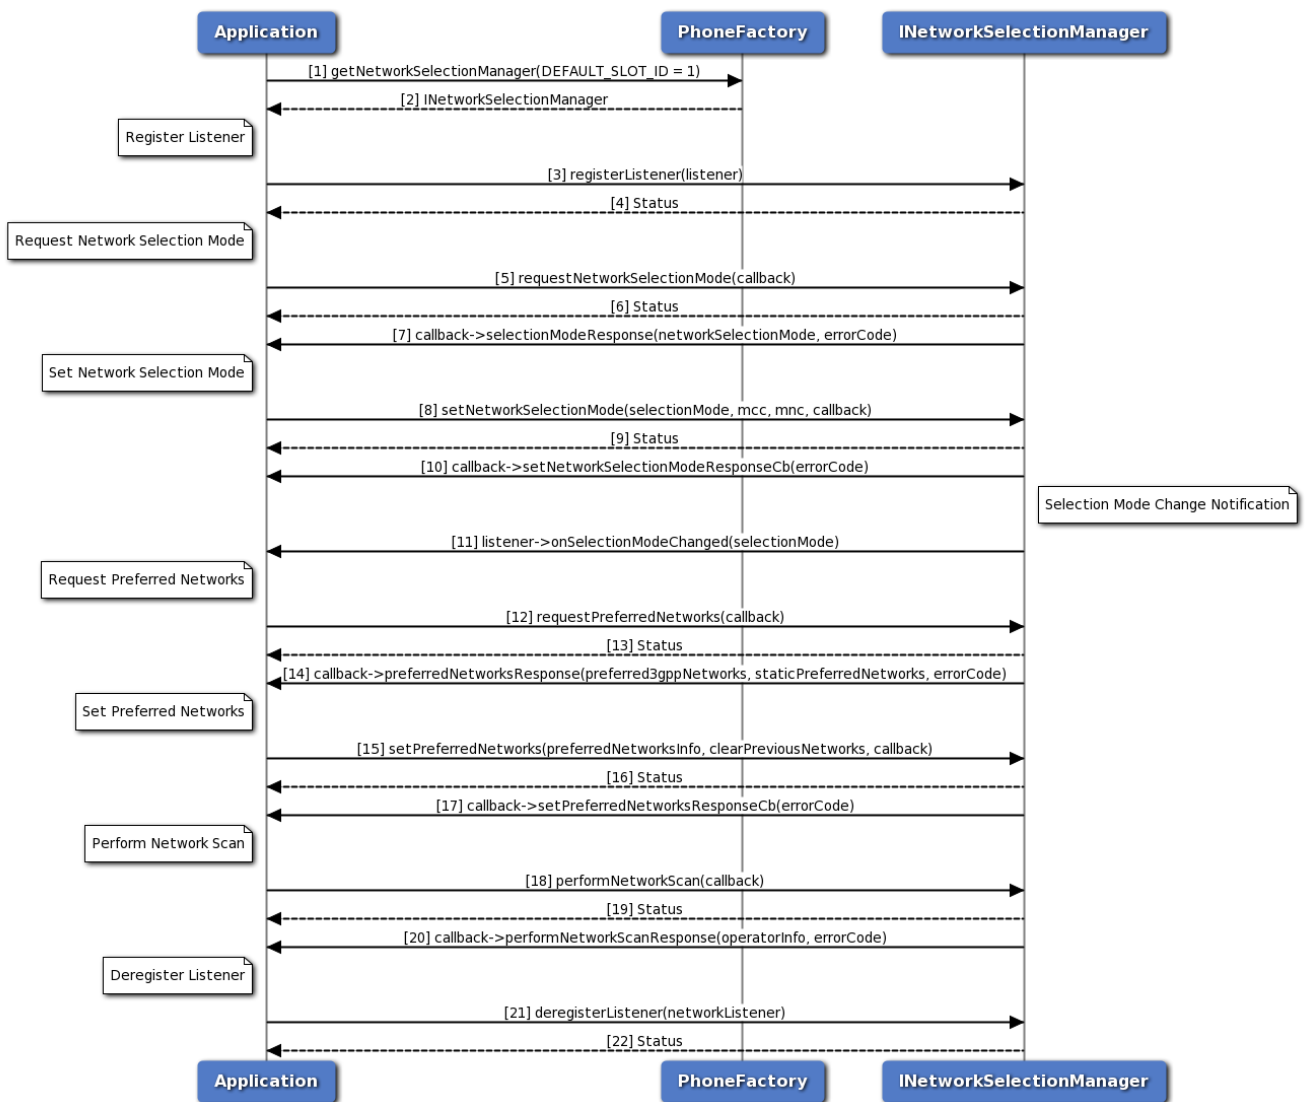

Figure 3-10 Network selection manager call flow

1. Application requests phone factory for network selection manager.
2. Phone factory returns INetworkSelectionManager object using which application will register or deregister a listener.
3. Application can register a listener to get notifications for network selection mode change.
4. Status of register listener i.e. either SUCCESS or other status will be returned to the application.
5. Application requests for network selection mode using INetworkSelectionManager object and gets asynchronous response using SelectionModeResponseCallback.
6. The application receives the status i.e. either SUCCESS or other status based on the execution of requestNetworkSelectionMode API.
7. The response for get network selection mode request is received by the application.
8. The application can also set network selection mode and optionally gets asynchronous response using ResponseCallback. MCC and MNC are optional for AUTOMATIC network selection mode.
9. Application receives the status i.e. either SUCCESS or other status based on the execution of setNetworkSelectionMode API.
10. Optionally the response for set network selection mode request is received by the application.
11. Registered listener will get notified for the network selection mode change.
12. Similarly, the application requests for preferred networks using INetworkSelectionManager object and gets asynchronous response using PreferredNetworksCallback.
13. The application receives the status i.e. either SUCCESS or other status based on the execution of requestPreferredNetworks API.
14. The response for get preferred networks request i.e. 3GPP preferred network list and static 3GPP preferred network list is received by the application asynchronously. Higher priority networks appear first in the list. The networks that appear in the 3GPP Preferred Networks list get higher priority than the networks in the static 3GPP preferred networks list.
15. The application can set 3GPP preferred network list and optionally gets asynchronous response using ResponseCallback. If clear previous networks flag is false then new 3GPP preferred network list is appended to existing preferred network list. If flag is true then old list is flushed and new 3GPP preferred network list is added.
16. Application receives the status i.e. either SUCCESS or other status based on the execution of setPreferredNetworks API.
17. Optionally the response for set preferred networks request is received by the application.
18. The application can perform network scan for available networks using INetworkSelectionManager object and gets asynchronous response using NetworkScanCallback.
19. Application receives the status i.e. either SUCCESS or other status based on the execution of performNetworkScan API.
20. Network name, MCC, MNC and status of the operator will be received by the application.
21. Application can deregister a listener there by it would not get notifications.
22. Status of deregister listener i.e. either SUCCESS or other status will be returned to the application.

### 3.2.10 Serving System Manager Call Flow

Serving system manager provides APIs to get and set RAT mode preference and get and set service domain preference. Registered listener will get notified for the change in RAT mode and service domain preference change.

Figure 3-11 Serving System Manager Call Flow

1. Application requests phone factory for serving system manager.
2. Phone factory returns IServingSystemManager object using which application will register or deregister a listener.
3. Application can register a listener to get notifications for RAT mode and service domain preference changes.
4. Status of register listener i.e. either SUCCESS or other status will be returned to the application.
5. Application requests for RAT mode preference using IServingSystemManager object and gets asynchronous response using RatPreferenceCallback.

6. The application receives the status i.e. either SUCCESS or other status based on the execution of requestRatPreference API.
7. The response for get RAT preference request is received by the application.
8. The application can also set RAT mode preference and optionally gets asynchronous response using ResponseCallback.
9. Application receives the status i.e. either SUCCESS or other status based on the execution of setRatPreference API.
10. Optionally the response for set RAT preference request is received by the application.
11. Registered listener will get notified for the RAT mode preference change.
12. Application requests for service domain preference using IServingSystemManager object and gets asynchronous response using ServiceDomainPreferenceCallback.
13. The application receives the status i.e. either SUCCESS or other status based on the execution of requestServiceDomainPreference API.
14. The response for get service domain preference request is received by the application.
15. The application can also set service domain preference and optionally gets asynchronous response using ResponseCallback.
16. Application receives the status i.e. either SUCCESS or other status based on the execution of setServiceDomainPreference API.
17. Optionally the response for set service domain preference request is received by the application.
18. Registered listener will get notified for the service domain preference change.
19. Application can deregister a listener there by it would not get notifications.
20. Status of deregister listener i.e. either SUCCESS or other status will be returned to the application.

### 3.3 Card Services

### 3.3.1 Get applications call flow

Figure 3-12 Get applications call flow

1. Application gets the CardManager object from PhoneFactory.
2. Application receives CardManager object in order to perform operations like getSlotIds and getCard.
3. The application registers a listener for Card info change event with CardManager.
4. Application receives the status i.e. either SUCCESS or INVALIDPARAM based on the registration of listener.
5. The response from onCardInfoChanged is received by the application whenever there is card info change.
6. The application gets the slotIds from the sub-system using CardManager.
7. Application receives the status i.e. either SUCCESS or NOTREADY along with the updated slotIds.
8. Then, the application sends request to CardManager to get Card object for a specific slotId.
9. Application receives Card object from CardManager in order to perform card operation like getApplications.

10. The application gets the CardApps from Card object.
11. The application receives CardApps which contain information such as AppId, AppType and AppState.
12. Now the application removes the listener associated with CardManager.
13. Application receives the status i.e. either SUCCESS or NOSUCH for the removal of listener.

### 3.3.2 Transmit APDU call flow

#### 3.3.2.1 On logical channel

Figure 3-13 On logical channel

1. The Application requests CardApp for the SIM application identifier.
2. The application receives the application identifier to perform open logical channel.
3. Application sends request to open the logical channel with the application identifier and optionally, gets asynchronous response in OpenLogicalChannelCallback.
4. The application receives the status i.e. either SUCCESS or FAILED based on execution of openLogicalChannel API.
5. Optionally, the application receives the response which contains either channel number on success or error in case of failure.
6. Then, the application transmits the APDU data on logical channel using the channel obtained earlier. Optionally, gets asynchronous response in TransmitAduResponseCallback.
7. The application receives the status i.e. either SUCCESS or FAILED based on execution of transmitAduLogicalChannel API.
8. Optionally, the application receives the response which contains either result on success or error in

- case of failure.
9. Finally, the application closes the logical channel that is opened to transmit APDU and optionally, gets asynchronous response in `CommandResponseCallback`.
  10. The application receives the status i.e. either `SUCCESS` or `FAILED` based on execution of `closeLogicalChannel` API.
  11. Optionally, the application receives the response which contains error in case of failure.

### 3.3.2.2 On basic channel

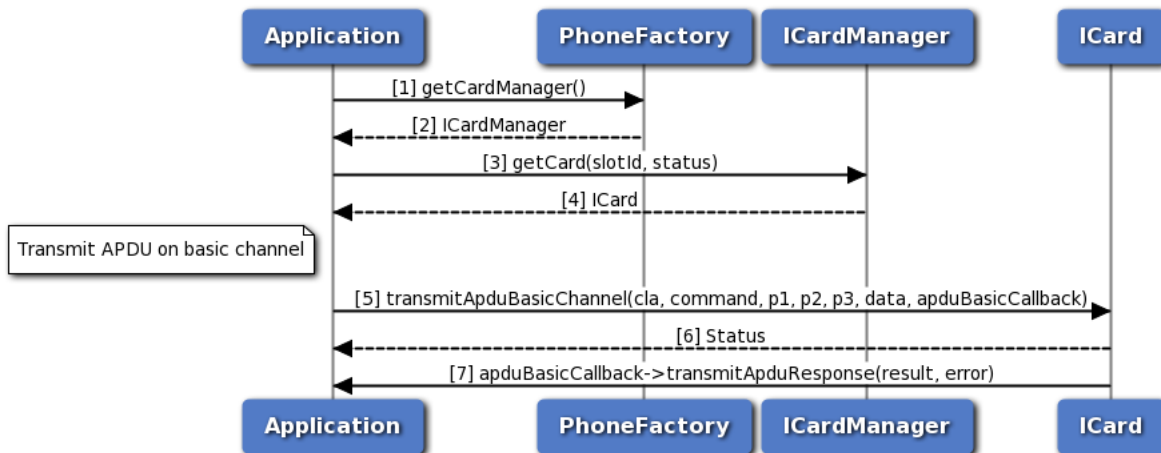

Figure 3-14 On basic channel

1. Application gets the `ICardManager` object from `PhoneFactory`.
2. Application receives `ICardManager` object in order to perform operation like `getCard`.
3. The application gets `ICard` object for a specific `slotId` from `ICardManager`.
4. Application receives `ICard` object in order to perform card operation like `transmitApduBasicChannel`.
5. The application transmits APDU data on basic channel and optionally, gets asynchronous response in `TransmitApduResponseCallback`.
6. The application receives the status i.e. either `SUCCESS` or `FAILED` based on execution of `transmitApduBasicChannel` API.
7. Optionally, the application receives the response which contains either result on success or error in case of failure.

### 3.3.3 SAP card manager call flow

### 3.3.3.1 Request card reader status, Request ATR, Transmit APDU call flow

Figure 3-15 Request card reader status, Request ATR, Transmit APDU call flow

{sap\_card\_operations.png,Request card reader status, Request ATR, Transmit APDU call flow,80,80,Request card reader status, Request ATR, Transmit APDU call flow }

1. The application gets SapCardManager object corresponding to slotId using PhoneFactory.
2. The application receives the SapCardManager object in order to perform SAP operations like request ATR, Card Reader Status and transmit APDU.
3. The application opens SIM Access Profile(SAP) connection with SIM card using default SAP condition (i.e. SAP\_CONDITION\_BLOCK\_VOICE\_OR\_DATA) and optionally, gets asynchronous response using CommandResponseCallback.
4. The application receives the status i.e. either SUCCESS or FAILED based on execution of openConnection API in SapCardManager.
5. Optionally, the response for openConnection is received by the application.

6. The application sends request card reader status command and optionally, gets asynchronous response using ICardReaderCallback.
7. The application receives the status i.e. either SUCCESS or FAILED based on execution of requestCardReaderStatus API in SapCardManager.
8. Optionally, the response for card reader status is received by the application.
9. Similarly, the application can send SAP Answer To Reset command and optionally, gets asynchronous response using IAttrResponseCallback.
10. The application receives the status i.e. either SUCCESS or FAILED based on execution of requestAttr API in SapCardManager.
11. Optionally, the response for SAP Answer To Reset is received by the application.
12. Similarly, the application sends the APDU on SAP mode and optionally, gets asynchronous response using ISapTransmitApduResponseCallback.
13. The application receives the status i.e. either SUCCESS or FAILED based on execution of transmitApdu API in SapCardManager.
14. Optionally, the response for transmit APDU is received by the application.
15. Now the application closes the SAP connection with SIM and optionally, gets asynchronous response using CommandResponseCallback.
16. The application receives the status i.e. either SUCCESS or FAILED based on execution of closeConnection API in SapCardManager.
17. Optionally, the response for SAP close connection is received by the application.

### 3.3.3.2 SIM Turn off, Turn on and Reset call flow

**Figure 3-16 SIM Turn off, Turn on and Reset call flow**

{sap\_mgr\_sim\_call\_flow.png,SIM Turn off, Turn on and Reset call flow,80,80,SIM Turn off, Turn on and Reset call flow}

1. Application gets SapCardManager object corresponding to slotID using PhoneFactory.
2. PhoneFactory returns the SapCardManager object to application in order to perform SAP operations like SIM power off, on or reset.
3. The application opens SIM Access Profile(SAP) connection with SIM card using default SAP condition (i.e. SAP\_CONDITION\_BLOCK\_VOICE\_OR\_DATA) and optionally, gets asynchronous response using CommandResponseCallback.

4. Application receives the status i.e. either SUCCESS or FAILED based on execution of openConnection API in SapCardManager.
5. Optionally, the response for openConnection is received by the application.
6. The application sends SIM Power Off command to turn off the SIM and optionally, gets asynchronous response using CommandResponseCallback.
7. The application receives the status i.e. either SUCCESS or FAILED based on execution of requestSimPowerOff API in SapCardManager.
8. Optionally, the response for SIM Power Off is received by the application.
9. Similarly, the application can send SIM Power On command to turn on the SIM and optionally, gets asynchronous response using CommandResponseCallback.
10. The application receives the status i.e. either SUCCESS or FAILED based on execution of requestSimPowerOn API in SapCardManager.
11. Optionally, the response for SIM Power On is received by the application.
12. Similarly, the application sends SIM Reset command to perform SIM Reset and optionally, gets asynchronous response.
13. The application receives the status i.e. either SUCCESS or FAILED based on execution of requestSimReset API in SapCardManager.
14. Optionally, the response for SIM Reset is received by the application.
15. Now the application closes the SAP connection with SIM and optionally, gets asynchronous response using CommandResponseCallback.
16. The application receives the status i.e. either SUCCESS or FAILED based on execution of closeConnection API in SapCardManager.
17. Optionally, the response for SAP close connection is received by the application.

### 3.3.4 Subscription Call flow

### 3.3.4.1 Subscription initialization

Figure 3-17 Subscription initialization call flow

1. Application can use `ISubscriptionManager::isSubsystemReady` to determine if the SubscriptionManager is ready.
2. The application receives the status i.e either true or false whether sub-system is ready or not.
3. If it is not ready, then the application could use `onSubsystemReady` which returns `std::future`.
4. SubscriptionManager notifies the application when the subsystem is ready through the `std::future` object.
5. The application waits until the asynchronous operation i.e `onSubsystemReady` completes.
6. SubscriptionManager uses `ICardManager::isSubsystemReady` to determine if the CardManager is ready.

7. The SubscriptionManager receives the status i.e either true or false whether sub-system is ready or not.
8. If it is not ready, then the SubscriptionManager could use onSubsystemReady which returns std::future.
9. CardManager notifies the SubscriptionManager when the subsystem is ready through the std::future object.
10. The SubscriptionManager waits until the asynchronous operation i.e onSubsystemReady completes.
11. CardManager updates the SubscriptionManager once the card manager sub-system is ready
12. SubscriptionManager uses ISubscription::isReady to determine if the Subscription is ready.
13. The SubscriptionManager receives the status i.e either true or false whether sub-system is ready or not.
14. If it is not ready, then the SubscriptionManager could use onSubsystemReady which returns std::future.
15. Subscription notifies the SubscriptionManager when the subsystem is ready through the std::future object.
16. The SubscriptionManager waits until the asynchronous operation i.e onSubsystemReady completes.
17. Subscription updates the SubscriptionManager when the subscription is ready.
18. SubscriptionManager updates the application once subscription manager initialization completes.

### 3.3.4.2 Subscription call flow

Figure 3-18 Subscription call flow

1. The application gets the PhoneManager object using PhoneFactory.
2. The application receives the PhoneManager object in order to get Subscription.
3. The application gets the Subscription object for given slot identifier using SubscriptionManager.
4. SubscriptionManager returns Subscription object to application. Subscription can be used to get subscription details like countryISO, operator details etc.
5. The Subscription manager registers a listener with CardManager to listen to the card info change notifications like card state PRESENT, ABSENT, UNKNOWN, ERROR and RESTRICTED.

6. The SubscriptionManager receives the status like SUCCESS or INVALIDPARAM based on registration of listener to CardManager.
7. The SubscriptionManager receives callback card info change i.e subscription info changed or removed.
8. The SubscriptionManager updates the application once the subscription info is updated.

### 3.4 Call flow for location services

Application will get the location manager object from location factory. The caller needs to register a listener. Application would then need to start the reports using one of 2 APIs depending on if the detailed or basic reports are needed. When reports are no longer required, the app needs to stop the report and de-register the listener.

**NOTE:** Applications need to have "locclient" Linux group permissions to be able to operate successfully with underlying services.

#### 3.4.1 Call flow to register/remove listener for generating basic reports

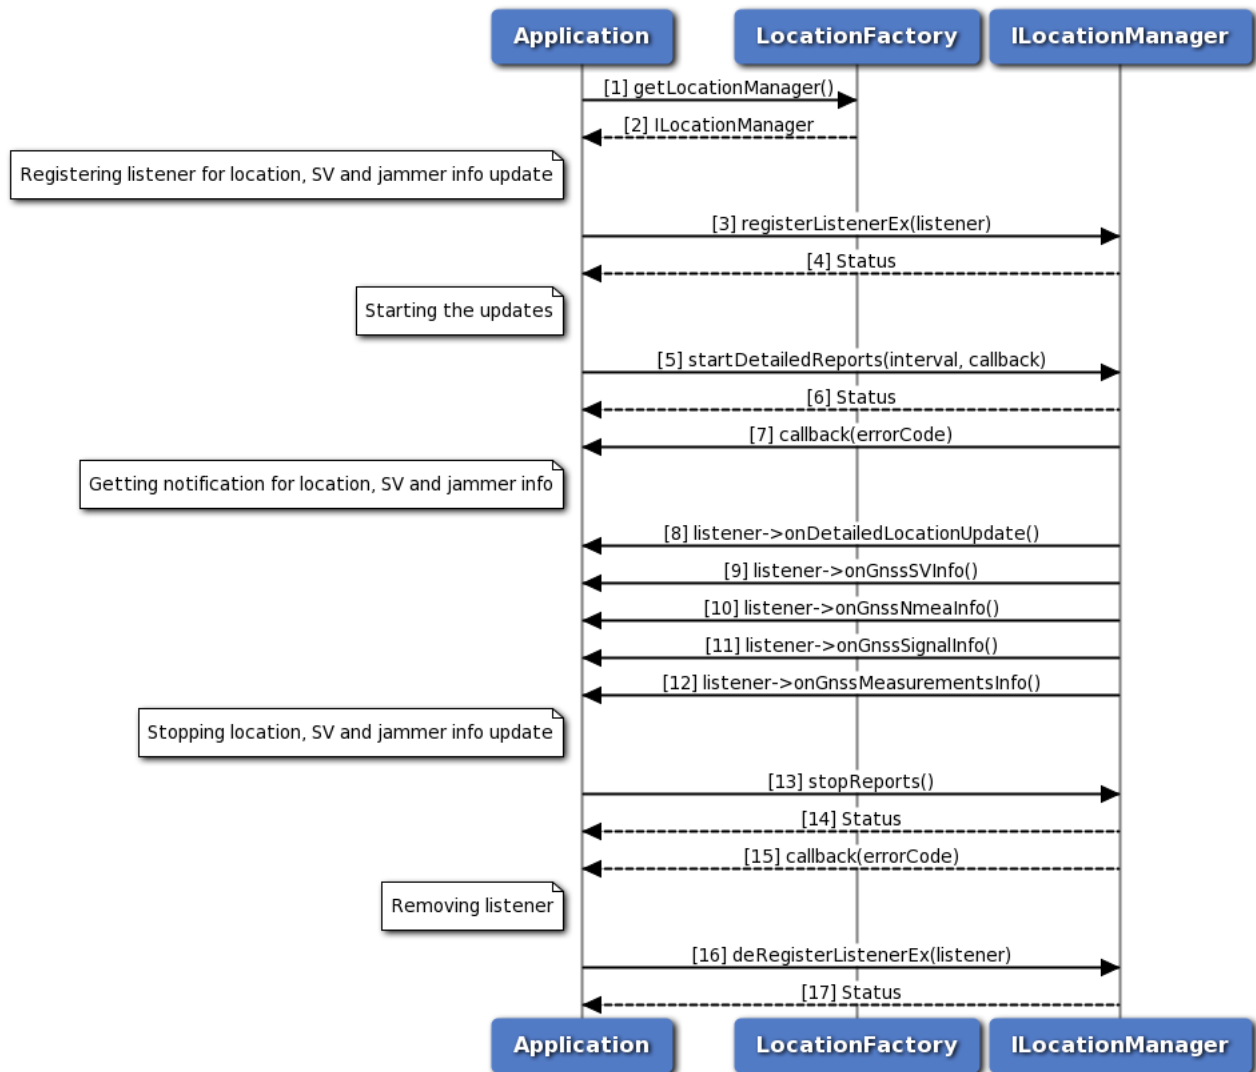

Figure 3-19 Call flow to register/remove listener for generating basic reports

1. Application requests location factory for location manager object.

2. Location factory returns ILocationManager object using which application will register or remove a listener.
3. Application can register a listener for getting notifications for location updates.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application starts the basic reports using startBasicReports API for getting location updates.
6. Status of startBasicReports i.e. either SUCCESS or FAILED will be returned to the application.
7. The response for startBasicReports is received by the application.
8. Application will get location updates like latitude, longitude and altitude etc.
9. Application stops receiving the report through stopReports API.
10. Status of stopReports i.e. either SUCCESS or FAILED will be returned to the application.
11. The response for stopReports is received by the application.
12. Application can remove listener and when the number of listeners are zero then location service will get stopped automatically.
13. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

### 3.4.2 Call flow to register/remove listener for generating detailed reports

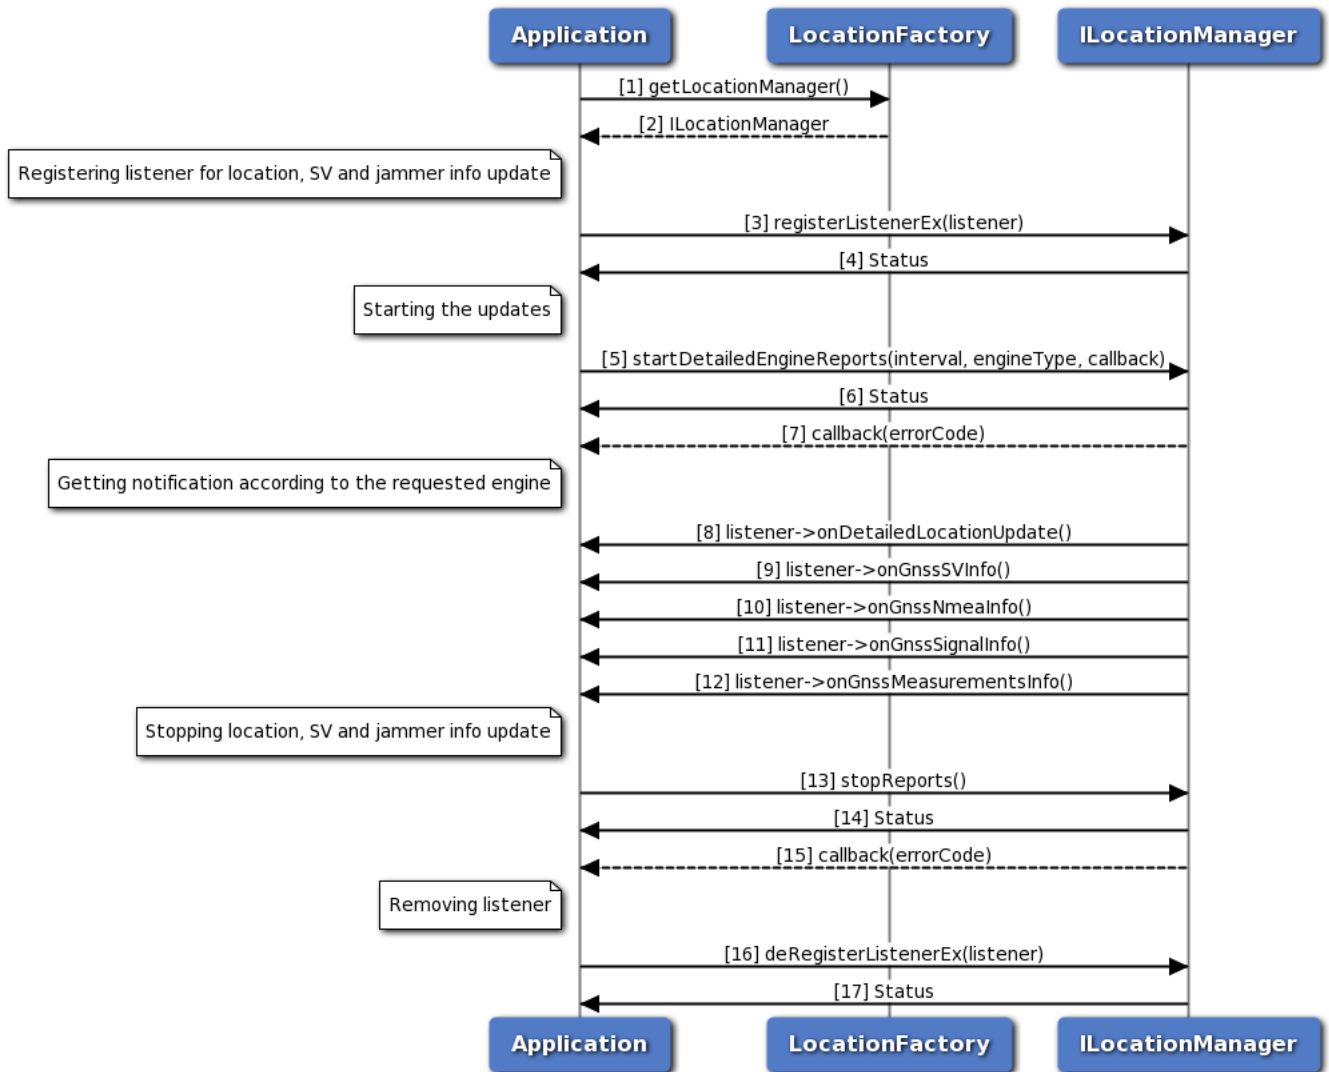

**Figure 3-20 Call flow to register/remove listener for generating detailed reports**

1. Application requests location factory for location manager object.
2. Location factory returns ILocationManager object using which application will register or remove a listener.
3. Application can register a listener for getting notifications for location, satellite vehicle, jammer signal, nmea and measurements updates.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application starts the detailed reports using startDetailedReports API for getting location, satellite vehicle, jammer signal, nmea and measurements updates.
6. Status of startDetailedReports i.e. either SUCCESS or FAILED will be returned to the application.
7. The response for startDetailedReports is received by the application.

8. Application will get location updates like latitude, longitude and altitude etc.
9. Application will receive satellite vehicle information like SV status and constellation etc.
10. Application will receive nmea information.
11. Application will receive jammer information etc.
12. Application will receive measurement information.
13. Application stops receiving all the reports through stopReports API.
14. Status of stopReports i.e. either SUCCESS or FAILED will be returned to the application.
15. The response for stopReports is received by the application.
16. Application can remove listener and when the number of listeners are zero then location service will get stopped automatically.
17. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

### 3.4.3 Call flow to register/remove listener for generating detailed engine reports

**Figure 3-21 Call flow to register/remove listener for generating detailed engine reports**

1. Application requests location factory for location manager object.
2. Location factory returns ILocationManager object using which application will register or remove a listener.
3. Application can register a listener for getting notifications for location, satellite vehicle and jammer signal, nmea and measurements updates.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application starts the detailed engine reports using startDetailedEngineReports API for getting location, satellite vehicle, jammer signal, nmea and measurements updates.
6. Status of startDetailedReports i.e. either SUCCESS or FAILED will be returned to the application.

7. The response for startDetailedReports is received by the application.
8. Application will get location updates like latitude, longitude and altitude etc from the requested engine type(SPE/PPE/Fused).
9. Application will receive satellite vehicle information like SV status and constellation etc depending on the requested SPE/PPE/Fused engine type.
10. Application will receive nmea information depending on the requested SPE/PPE/Fused engine type
11. Application will receive jammer information etc depending on the requested SPE/PPE/Fused engine type.
12. Application will receive measurement information etc depending on the requested SPE/PPE/Fused engine type.
13. Application stops receiving all the reports through stopReports API.
14. Status of stopReports i.e. either SUCCESS or FAILED will be returned to the application.
15. The response for stopReports is received by the application.
16. Application can remove listener and when the number of listeners are zero then location service will be stopped automatically.
17. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

### 3.4.4 Call flow to register/remove listener for system info updates

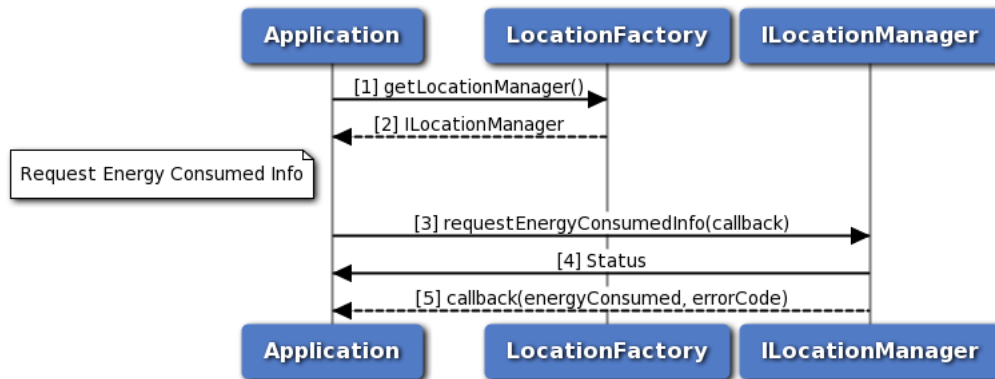

Figure 3-22 Call flow to register/remove listener for system info updates

1. Application requests location factory for location manager object.
2. Location factory returns ILocationManager object using which application will register or remove a listener.

3. Application can register a listener for system information updates with `registerForSystemInfoUpdates`.
4. Status of `registerForSystemInfoUpdates` i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for `registerForSystemInfoUpdates` is received by the application.
6. Application will get system information update.
7. Application can remove listener with `deRegisterForSystemInfoUpdates`.
8. Status of `deRegisterForSystemInfoUpdates` i.e. either SUCCESS or FAILED will be returned to the application.
9. The response for `deRegisterForSystemInfoUpdates` is received by the application.

### 3.4.5 Call flow to request energy consumed information

**Figure 3-23 Call flow to request energy consumed information**

1. Application requests location factory for location manager object.
2. Location factory returns `ILocationManager` object.
3. Application can request for energy consumed information with `requestEnergyConsumedInfo`.
4. Status of `requestEnergyConsumedInfo` i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for `requestEnergyConsumedInfo` is received by the application.

### 3.4.6 Call flow to get year of hardware information

Figure 3-24 Call flow to get year of hardware information

1. Application requests location factory for location manager object.
2. Location factory returns ILocationManager object.
3. Application can request for year of hardware information with getYearOfHw.
4. Status of getYearOfHw i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for getYearOfHw is received by the application.

### 3.4.7 Call flow to get terrestrial positioning information

Figure 3-25 Call flow to get terrestrial positioning information

1. Application requests location factory for location manager object.
2. Location factory returns ILocationManager object.
3. Application can request for terrestrial positioning information with getTerrestrialPosition API.

4. Status of `getTerrestrialPosition` i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for `getTerrestrialPosition` is received by the application.
6. Single shot terrestrial position information is received by the application.

### 3.4.8 Call flow to cancel terrestrial positioning information

Figure 3-26 Call flow to cancel terrestrial positioning information

1. Application requests location factory for location manager object.
2. Location factory returns `ILocationManager` object.
3. Application can cancel request for terrestrial positioning information with `cancelTerrestrialPositionRequest` API.
4. Status of `cancelTerrestrialPositionRequest` i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for `cancelTerrestrialPositionRequest` is received by the application.

### 3.4.9 Call flow to enable/disable constraint time uncertainty

Figure 3-27 Call flow to enable/disable constraint time uncertainty

1. Application requests location factory for location configurator object.

2. Location factory returns ILocationConfigurator object.
3. Application enables/disables constraint tunc using configureCTunc API.
4. Status of configureCTunc i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureCTunc is received by the application.

### 3.4.10 Call flow to enable/disable PACE

Figure 3-28 Call flow to enable/disable PACE

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application enables/disables PACE using configurePACE API.
4. Status of configurePACE i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configurePACE is received by the application.

### 3.4.11 Call flow to delete all aiding data

Figure 3-29 Call flow to delete all aiding data

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.

3. Application deletes all aiding data using deleteAllAidingData API.
4. Status of deleteAllAidingData i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for deleteAllAidingData is received by the application.

### 3.4.12 Call flow to configure lever arm parameters

Figure 3-30 Call flow to configure lever arm parameters

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures lever arm parameters using configureLeverArm API.
4. Status of configureLeverArm i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureLeverArm is received by the application.

### 3.4.13 Call flow to configure blacklisted constellations

Figure 3-31 Call flow to configure blacklisted constellations

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures blacklisted constellations using configureConstellations API.

4. Status of configureConstellations i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureConstellations is received by the application.

### 3.4.14 Call flow to configure robust location

Figure 3-32 Call flow to configure robust location

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures robust location using configureRobustLocation API.
4. Status of configureRobustLocation i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureRobustLocation is received by the application.

### 3.4.15 Call flow to configure min gps week

Figure 3-33 Call flow to configure min gps week

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures min gps week using configureMinGpsWeek API.

4. Status of configureMinGpsWeek i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureMinGpsWeek is received by the application.

### 3.4.16 Call flow to request min gps week

Figure 3-34 Call flow to request min gps week

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application requests min gps week using requestMinGpsWeek API.
4. Status of requestMinGpsWeek i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for requestMinGpsWeek is received by the application.

### 3.4.17 Call flow to delete specified data

Figure 3-35 Call flow to delete specified data

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application requests delete specified data using deleteAidingData API.
4. Status of deleteAidingData i.e. either SUCCESS or FAILED will be returned to the application.

- The response for deleteAidingData is received by the application.

### 3.4.18 Call flow to configure min sv elevation

Figure 3-36 Call flow to configure min sv elevation

- Application requests location factory for location configurator object.
- Location factory returns ILocationConfigurator object.
- Application configures min SV elevation using configureMinSVElevation API.
- Status of configureMinSVElevation i.e. either SUCCESS or FAILED will be returned to the application.
- The response for configureMinSVElevation is received by the application.

### 3.4.19 Call flow to request min sv elevation

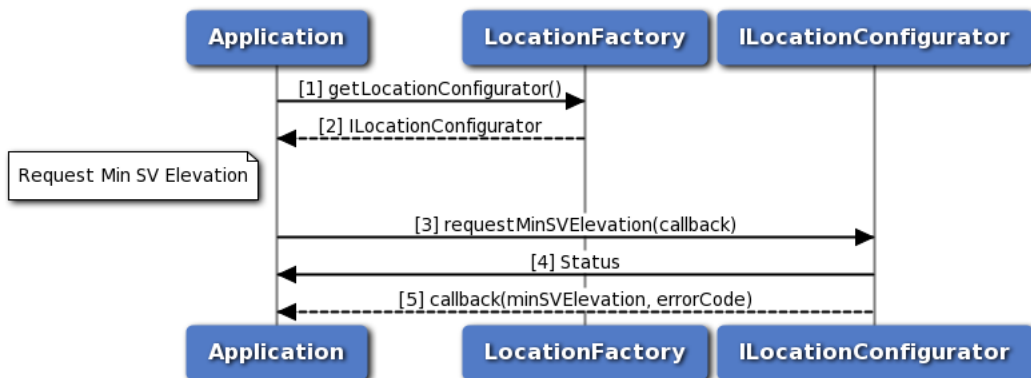

Figure 3-37 Call flow to request min sv elevation

- Application requests location factory for location configurator object.
- Location factory returns ILocationConfigurator object.
- Application requests min SV elevation using requestMinSVElevation API.

4. Status of requestMinSVElevation i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for requestMinSVElevation is received by the application.

### 3.4.20 Call flow to request robust location

Figure 3-38 Call flow to request robust location

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application requests robust location using requestRobustLocation API.
4. Status of requestRobustLocation i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for requestRobustLocation is received by the application.

### 3.4.21 Call flow to configure dead reckoning engine

Figure 3-39 Call flow to configure dead reckoning engine

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures dead reckoning engine using configureDR API.

4. Status of configureDR i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureDR is received by the application.

### 3.4.22 Call flow to configure secondary band

Figure 3-40 Call flow to configure secondary band

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures secondary band using configureSecondaryBand API.
4. Status of configureSecondaryBand i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureSecondaryBand is received by the application.

### 3.4.23 Call flow to request secondary band

Figure 3-41 Call flow to request secondary band

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application requests secondary band using requestSecondaryBandConfig API.

4. Status of requestSecondaryBandConfig i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for requestSecondaryBandConfig is received by the application.

### 3.4.24 Call flow to configure engine state

Figure 3-42 Call flow to configure engine state

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures engine state using configureEngineState API.
4. Status of configureEngineState i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureEngineState is received by the application.

### 3.4.25 Call flow to provide user consent for terrestrial positioning

Figure 3-43 Call flow to provide user consent for terrestrial positioning

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.

3. Application provides user consent for terrestrial positioning using provideConsentForTerrestrialPositioning API.
4. Status of provideConsentForTerrestrialPositioning i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for provideConsentForTerrestrialPositioning is received by the application.

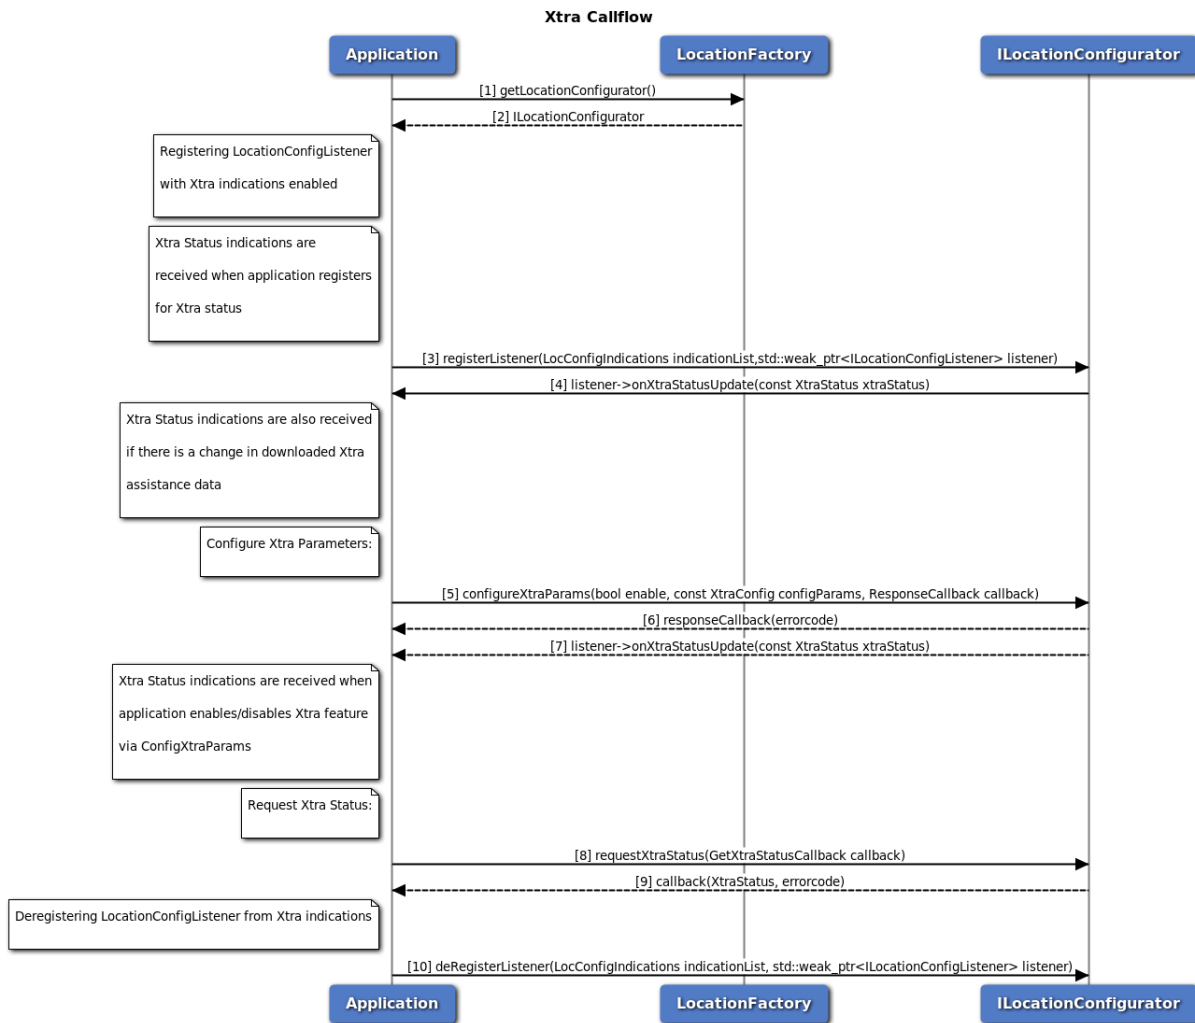

### 3.4.26 Call flow to configure NMEA sentence type

**Figure 3-44 Call flow to configure NMEA sentence type**

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application configures NMEA sentence type using configureNmeaTypes API.
4. Status of configureNmeaTypes i.e. either SUCCESS or FAILED will be returned to the application.
5. The response for configureNmeaTypes is received by the application.

### 3.4.27 Call flow to represent Xtra Feature

**Figure 3-45 Call flow to represent Xtra Feature**

1. Application requests location factory for location configurator object.
2. Location factory returns ILocationConfigurator object.
3. Application registers config listener for Xtra Status indications.
4. Listener API onXtraStatusUpdate is invoked while registering for Xtra indications.
5. Application configures Xtra Params using configureXtraParams.
6. Location Configurator invokes response callback with errorcode.
7. Listener API onXtraStatusUpdate is invoked when Xtra feature is enabled/disabled.
8. Application requests Xtra Status using requestXtraStatus.
9. Location Configurator invokes GetXtraStatus callback with XtraStatus and errorcode.
10. Application deregisters config listener from Xtra Status indications.

## 3.5 Data Services

Applications need to have "radio" Linux group permissions to be able to operate successfully with underlying services.

### 3.5.1 Start/Stop for data connection manager call flow

1. Application requests Data Connection Manager object associated with sim id from data factory. Application can optionally provide callback to be called when manager initialization is completed.
2. Data factory returns shared pointer to data connection manager object to application.
3. Application request current service status of data connection manager returned by data factory.
4. Data connection manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Data connection manager calls application callback with initialization result (success/failure).
5. Application registers as listener to get notifications for data call change.
6. The application receives the status i.e. either SUCCESS or FAILED based on the registration of the listener.
7. Application requests for start data call and optionally gets asynchronous response using startDataCallback.
8. Application receives the status i.e. either SUCCESS or FAILED based on the execution of startDataCall.
9. Optionally, the application gets asynchronous response for startDataCall using startDataCallback.
10. Application requests for stop data call and optionally gets asynchronous response using stopDataCallback.
11. Application receives the status i.e. either SUCCESS or FAILED based on the execution of stopDataCall.
12. Optionally, the application gets asynchronous response for stopDataCall using stopDataCallback.

### 3.5.2 Request data profile list call flow

Figure 3-47 Request data profile list call flow

1. Application requests Data profile Manager object associated with sim id from data factory. Application can optionally provide callback to be called when manager initialization is completed.
2. Data factory returns shared pointer to data profile manager object to application.
3. Application request current service status of data profile manager returned by data factory.
4. Data profile manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Data profile manager calls application callback with initialization result (success/failure).
5. Application creates listener class of type IDataProfileListener
6. Application register created object in step 5 as listener to data profile changes
7. Application receives the status i.e. either SUCCESS or FAILED based on the execution of registerListener
8. Application requests list of profile

9. Application receives the status i.e. either SUCCESS or FAILED based on the execution of requestProfileList
10. Application gets callback with list of all profiles

### 3.5.3 Data Serving System Manager Call Flow

Data Serving System manager provides the interface to access network and modem low level services. It provides APIs to get current dedicated radio bearer, get current service status and preferred RAT, and get current roaming status. Serving System Listener provides an interface for application to receive data serving system notification events such as change in dedicated radio bearer, change in service status, or change in roaming status. The application must register as a listener for Serving System updates.

#### 3.5.3.1 Get Dedicated Radio Bearer Call Flow

**Figure 3-48 Get Dedicated Radio Bearer Call Flow**

1. Application requests data factory for data serving system manager object with slot Id and init callback.
2. Data factory returns IServingSystemManager object to application.
3. Serving System Manager calls application callback provided in step 1 with initialization result pass/fail.
4. Application register itself as listener with Serving System manager to receive dedicated radio bearer changes notification.
5. Application gets success for registering as listener.
6. Application calls getDrbStatus to get current dedicated radio bearer status.
7. Application receives the current dedicated bearer status.
8. Dedicated radio bearer changes in modem
9. Application gets onDrbStatusChanged indication with new status

### 3.5.3.2 Request Service Status Call Flow

**Figure 3-49 Request service status call flow**

1. Application requests data factory for data servicing system manager object with slot Id and init callback.
2. Data factory returns IServicingSystemManager object to application.
3. Serving System Manager calls application callback provided in step 1 with initialization result pass/fail.
4. Application register itself as listener with Serving System manager to receive service status changes notification.
5. Application gets success for registering as listener.
6. Application calls requestServiceStatus to get current service status and provides callback.
7. Application receives the status i.e. either SUCCESS or FAILED based on the execution of requestServiceStatus.
8. Application gets asynchronous response for requestServiceStatus through callback provided in step 4 with current service status.
9. Service status changes in modem
10. Application gets onServiceStateChanged indication with new status

### 3.5.3.3 Request Roaming Status Call Flow

**Figure 3-50 Request roaming status call flow**

1. Application requests data factory for data serving system manager object with slot Id and init callback.
2. Data factory returns IServingSystemManager object to application.
3. Serving System Manager calls application callback provided in step 1 with initialization result pass/fail.
4. Application register itself as listener with Serving System manager to receive roaming status changes notification.
5. Application gets success for registering as listener.
6. Application calls requestRoamingStatus to get current service status and provides callback.
7. Application receives the status i.e. either SUCCESS or FAILED based on the execution of requestRoamingStatus.
8. Application gets asynchronous response for requestRoamingStatus through callback provided in step 4 with current service status.
9. Roaming status changes in modem
10. Application gets onRoamingStatusChanged indication with new status

### 3.5.4 Data Filter Manager Call Flow

Data Filter manager provides APIs to get/set data filter mode, add/remove data restrict filters. Its API can be used per data call or globally to apply the same changes to all the underlying currently up data call. It also has a listener interface for notifications for data filter status update. Application will get the Data Filter manager object from data factory. The application can register a listener for data filter mode change updates.

### 3.5.4.1 Call flow to Set/Get data filter mode

Figure 3-51 Get/Set data filter mode call flow

1. Application requests data factory for data connection manager object.
2. Data factory returns IDataConnectionManager object to application.
3. Application requests data factory for data filter manager object.
4. Data factory returns IDataFilterManager object to application.
5. Application requests for start data call and optionally gets asynchronous response using startDataCallback.
6. Application receives the status i.e. either SUCCESS or FAILED based on the execution of startDataCall.
7. Optionally, the application gets asynchronous response for startDataCall using startDataCallback.
8. Application requests for set data filter mode to enable and optionally gets asynchronous response using ResponseCallback.

9. Application receives the status i.e. either SUCCESS or FAILED based on the execution of setDataRestrictMode.
10. Optionally, the application gets asynchronous response for setDataRestrictMode using ResponseCallback.
11. Application requests for get data filter mode and optionally gets asynchronous response using DataRestrictModeCb.
12. Application receives the status i.e. either SUCCESS or FAILED based on the execution of requestDataRestrictMode.
13. Optionally, the application gets asynchronous response for requestDataRestrictMode using DataRestrictModeCb.

### 3.5.4.2 Call flow to Add data restrict filter

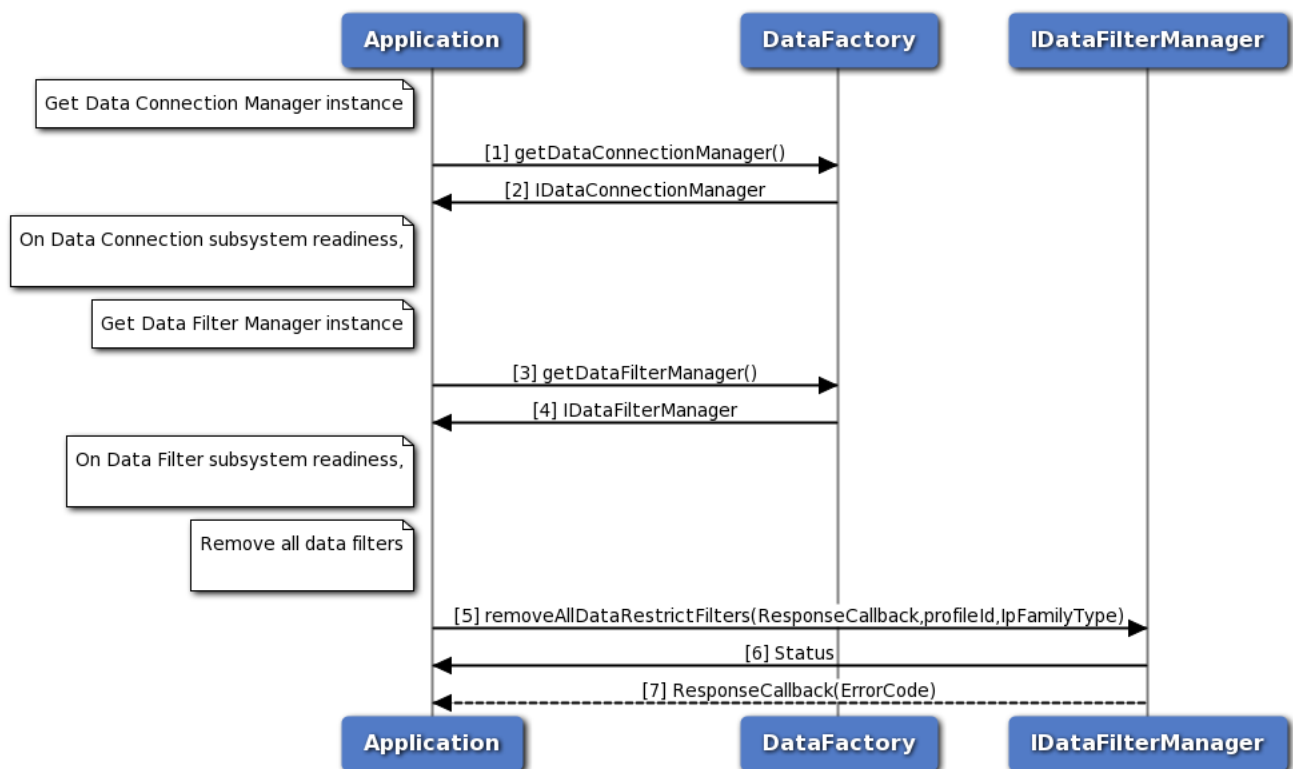

Figure 3-52 Add data restrict filter call flow

1. Application requests data factory for data connection manager object.
2. Data factory returns IDataConnectionManager object to application.

3. Application requests data factory for data filter manager object.
4. Data factory returns IDataFilterManager object to application.
5. Application requests for start data call and optionally gets asynchronous response using startDataCallback.
6. Application receives the status i.e. either SUCCESS or FAILED based on the execution of startDataCall.
7. Optionally, the application gets asynchronous response for startDataCall using startDataCallback.
8. Application requests for add data filter and optionally gets asynchronous response using ResponseCallback.
9. Application receives the status i.e. either SUCCESS or FAILED based on the execution of addDataRestrictFilter.
10. Optionally, the application gets asynchronous response for addDataRestrictFilter using ResponseCallback.

### 3.5.4.3 Call flow to Remove data restrict filter

**Figure 3-53 Remove data restrict filter call flow**

1. Application requests data factory for data connection manager object.
2. Data factory returns IDataConnectionManager object to application.
3. Application requests data factory for data filter manager object.

4. Data factory returns IDataFilterManager object to application.
5. Application requests for start data call and optionally gets asynchronous response using startDataCallback.
6. Application receives the status i.e. either SUCCESS or FAILED based on the execution of startDataCall.
7. Optionally, the application gets asynchronous response for startDataCall using startDataCallback.
8. Application requests for add data filter and optionally gets asynchronous response using ResponseCallback.
9. Application receives the status i.e. either SUCCESS or FAILED based on the execution of removeAllDataRestrictFilters.
10. Optionally, the application gets asynchronous response for removeAllDataRestrictFilters using ResponseCallback.

### **3.5.5 Data Networking Call Flow**

Application will get the following manager objects from data factory to configure networking. IVlanManager is used to access all VLAN APIs. INatManager is used to access all Static NAT APIs. IFirewallManager is used to access all Firewall APIs.

### 3.5.5.1 Create VLAN and Bind it to PDN in data vlan manager call flow

Figure 3-54 Create VLAN and bind it to PDN for data VLAN manager call flow

1. Application requests data factory for data IVlanManager object. Application can optionally provide callback to be called when manager initialization is completed. 1.1. If IVlanManager object does not exist, data factory will create new object.
2. Data factory returns shared pointer to IVlanManager object to application.
3. Application request current service status of vlan manager returned by data factory
4. The application receives the Status i.e. either true or false to indicate whether sub-system is ready or not. 4.1. If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1 4.2. Vlan manager calls application callback with initialization result (success/failure).
5. On success, application calls IVlanManager::createVlan with assigned id, interface, and acceleration type.
6. Application receives synchronous Status which indicates if the IVlanManager::createVlan request

was sent successfully.

7. Application is notified of the Status of the IVlanManager::createVlan request (either SUCCESS or FAILED) via the application-supplied callback.
8. Application calls IVlanManager::bindWithProfile with Vlan id and profile id.
9. Application receives synchronous Status which indicates if the IVlanManager::bindWithProfile request was sent successfully.
1. Application is notified of the Status of the IVlanManager::bindWithProfile request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.5.5.2 LAN-LAN VLAN Configuration from EAP usecase call flow

Figure 3-55 LAN-LAN VLAN Configuration Usecase from EAP call flow

1. Application requests data factory for data IVlanManager for local operation object. Application can optionally provide callback to be called when manager initialization is completed.
2. Data factory returns shared pointer to local vlan manager object to application.

3. Application request current service status of local vlan manager returned by data factory.
4. Vlan manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Vlan manager calls application callback with initialization result (success/failure).
5. On success, application calls IVlanManager::createVlan with USB interface, Vlan id 1 and no acceleration.
6. Vlan manager returns synchronous response to application (success/fail).
7. Vlan manager calls application provided callback in step 5 with createVlan results
8. Application requests data factory for data IVlanManager for remote operation object. Application can optionally provide callback to be called when manager initialization is completed.
9. Data factory returns shared pointer to remote vlan manager object to application.
10. Application request current service status of remote vlan manager returned by data factory.
11. Vlan manager returns current service status. 11.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 11.2 Vlan manager calls application callback with initialization result (success/failure).
12. On success, application calls IVlanManager::createVlan with USB interface, Vlan id 1 and acceleration.
13. Vlan manager returns synchronous response to application (success/fail).
14. Vlan manager calls application provided callback in step 12 with createVlan results.
15. Application calls IVlanManager::createVlan with ETH interface, Vlan id 1 and acceleration.
16. Vlan manager returns synchronous response to application (success/fail).
17. Vlan manager calls application provided callback in step 15 with createVlan results.

### 3.5.5.3 LAN-LAN VLAN Configuration from A7 usecase call flow

**Figure 3-56 LAN-LAN VLAN Configuration Use Case from A7 call flow**

1. Application requests data factory for data IVlanManager for local operation object. Application can optionally provide callback to be called when manager initialization is completed.
2. Data factory returns shared pointer to local vlan manager object to application.
3. Application request current service status of local vlan manager returned by data factory.
4. Vlan manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Vlan manager calls application callback with initialization result (success/failure).
5. On success, application calls IVlanManager::createVlan with USB interface, Vlan id 1 and acceleration.
6. Vlan manager returns synchronous response to application (success/fail).
7. Vlan manager calls application provided callback in step 5 with createVlan results.
8. Application calls IVlanManager::createVlan with ETH interface, Vlan id 1 and acceleration.
9. Vlan manager returns synchronous response to application (success/fail).
10. Vlan manager calls application provided callback in step 8 with createVlan results.

### 3.5.5.4 LAN-WAN VLAN Configuration from EAP usecase call flow

Figure 3-57 LAN-WAN VLAN Configuration Usecase from EAP call flow

1. Application requests data factory for local data vlan manager object.
2. Data factory returns shared pointer to local vlan manager to application.
3. Application request current service status of local vlan manager returned by data factory.
4. Vlan manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Vlan manager calls application callback with initialization result (success/failure).
5. On success, application calls IVlanManager::createVlan with USB interface, Vlan id 1 and no acceleration.
6. Vlan manager returns synchronous response to application (success/fail).
7. Vlan manager calls application provided callback in step 5 with createVlan results.
8. Application requests data factory for remote data vlan manager object.
9. Data factory returns shared pointer to remote vlan manager to application.
10. Application request current service status of remote vlan manager returned by data factory.
11. Vlan manager returns current service status. 11.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 8. 11.2 Vlan manager calls application callback with initialization result (success/failure).
12. On success, application calls IVlanManager::createVlan with USB interface, Vlan id 1 and acceleration.
13. Vlan manager returns synchronous response to application (success/fail).
14. Vlan manager calls application provided callback in step 12 with createVlan results.
15. Application calls IVlanManager::createVlan with ETH interface, Vlan id 1 and acceleration.
16. Vlan manager returns synchronous response to application (success/fail).
17. Vlan manager calls application provided callback in step 15 with createVlan results.
18. Application calls IVlanManager::bindWithProfile with profile id to bind with.
19. Vlan manager returns synchronous response to application (success/fail).
20. Vlan manager calls application provided callback in step 18 with bindWithProfile results. If DMZ is needed:
  - (a) Application requests data factory for firewall manager object.
  - (b) Data factory returns shared pointer to firewall manager to application.
  - (c) Application request current service status of firewall manager returned by data factory.
  - (d) Firewall manager returns current service status. 24.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 21. 24.2 Firewall manager calls application callback with initialization result (success/failure).
  - (e) Application calls firewall manager enableDmz with profile id and local address to be enable Dmz on.
  - (f) Firewall manager returns synchronous response to application (success/fail).
  - (g) Firewall manager calls application provided callback in step 25 with enableDmz results.
21. Application requests data factory for data connection manager object.

22. Data factory returns shared pointer to data connection manager to application.
23. Application request current service status of data connection manager returned by data factory.
24. Data connection manager returns current service status. 31.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 28.  
31.2 Data connection manager calls application callback with initialization result (success/failure).
25. Application can call data Connection manager startDataCall with profile id to start data call on, Ip Family type, operation Type and APN Name.
26. Data connection Manager returns synchronous response to application (success/fail).
27. Data connection Manager returns notification to application with data call details.

### 3.5.5.5 LAN-WAN VLAN Configuration from A7 usecase call flow

Figure 3-58 LAN-WAN VLAN Configuration Usecase from A7 call flow

1. Application requests data factory for local data vlan manager object.
2. Data factory returns shared pointer to local vlan manager to application.
3. Application request current service status of local vlan manager returned by data factory.
4. Vlan manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Vlan manager calls application callback with initialization result (success/failure).
5. On success, application calls IVlanManager::createVlan with USB interface, Vlan id 1 and acceleration.
6. Vlan manager returns synchronous response to application (success/fail).
7. Vlan manager calls application provided callback in step 5 with createVlan results.
8. Application calls IVlanManager::createVlan with ETH interface, Vlan id 1 and acceleration.
9. Vlan manager returns synchronous response to application (success/fail).
10. Vlan manager calls application provided callback in step 8 with createVlan results.
11. Application calls IVlanManager::bindWithProfile with profile id to bind with.
12. Vlan manager returns synchronous response to application (success/fail).
13. Vlan manager calls application provided callback in step 11 with bindWithProfile results. If DMZ is needed:
  - (a) Application requests data factory for firewall manager object.
  - (b) Data factory returns shared pointer to firewall manager to application.
  - (c) Application request current service status of firewall manager returned by data factory.
  - (d) Firewall manager returns current service status. 17.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 14. 17.2 Firewall manager calls application callback with initialization result (success/failure).
  - (e) Application calls firewall manager enableDmz with profile id and local address to be enable Dmz on.
  - (f) Firewall manager returns synchronous response to application (success/fail).
  - (g) Firewall manager calls application provided callback in step 25 with enableDmz results.
14. Application requests data factory for data connection manager object.
15. Data factory returns shared pointer to data connection manager to application.
16. Application request current service status of data connection manager returned by data factory.
17. Data connection manager returns current service status. 24.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 21. 24.2 Data connection manager calls application callback with initialization result (success/failure).
18. Application can call data Connection manager startDataCall with profile id to start data call on, Ip Family type, operation Type and APN Name.
19. Data connection Manager returns synchronous response to application (success/fail).
20. Data connection Manager returns notification to application with data call details.

### 3.5.5.6 Create Static NAT entry in data Static NAT manager call flow

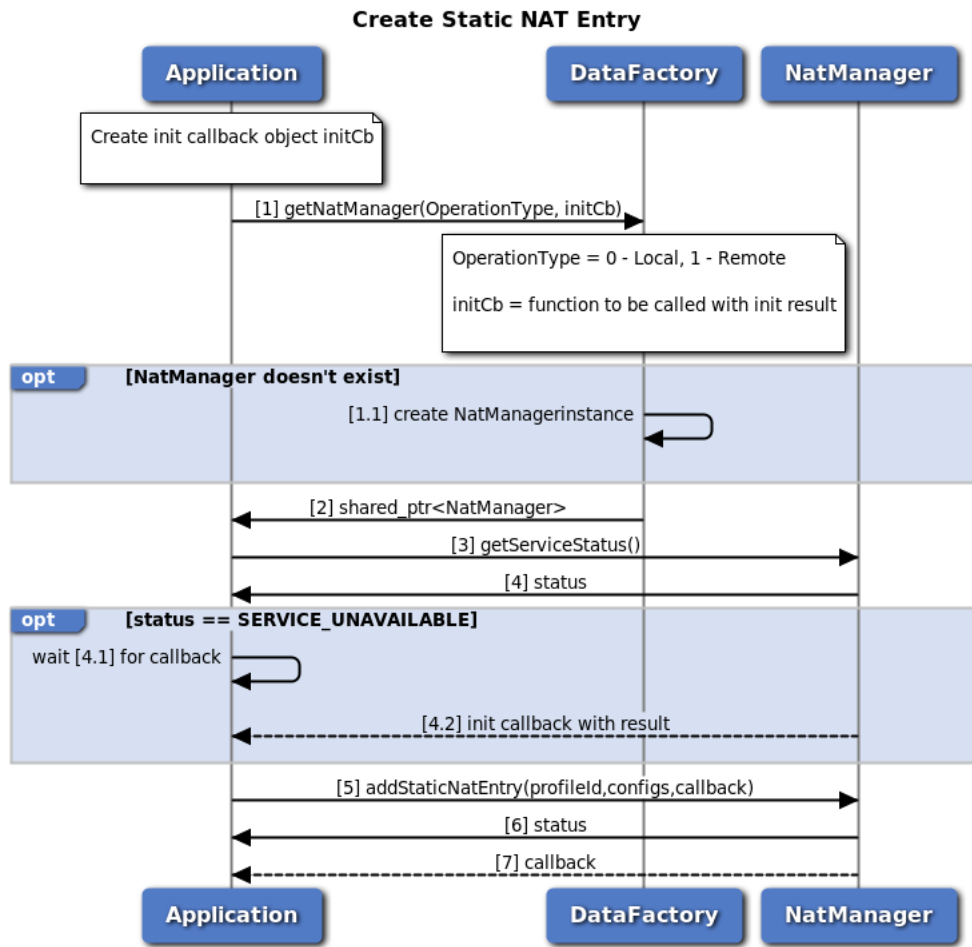

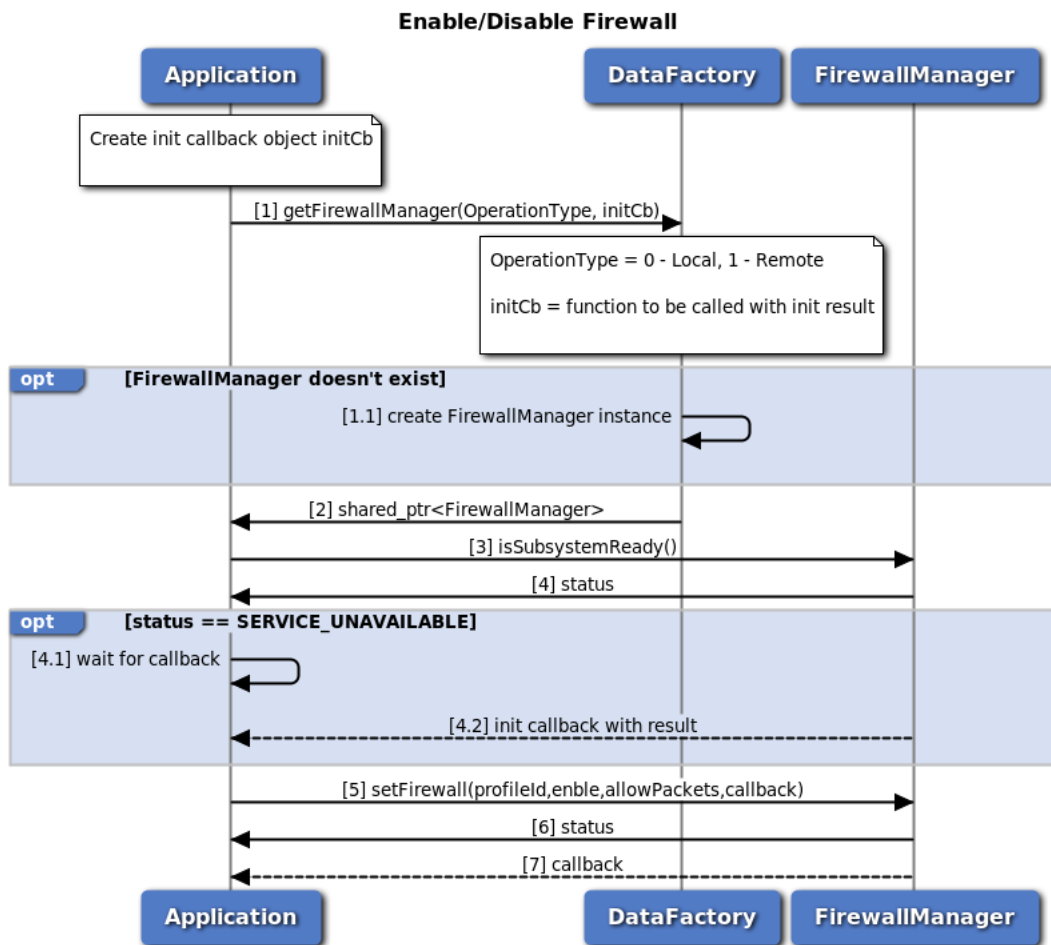

Figure 3-59 Create Static NAT entry for data NAT manager call flow

1. Application requests data factory for data nat manager object. 1.1. If nat manager object does not exist, data factory will create new object.
2. Data factory returns shared pointer to nat manager object to application.
3. Application request current service status of nat manager returned by data factory.
4. Nat manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Nat manager calls application callback with initialization result (success/failure).
5. On success, application calls nat manager addStaticNatEntry with profileId, private IP address port, private port, global port and IP Protocol.
6. Application receives synchronous Status which indicates if the nat manager addStaticNatEntry request was sent successfully.
7. Application is notified of the result of the nat manager addStaticNatEntry request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.5.5.7 Firewall Enablement in data Firewall manager call flow

**Figure 3-60 Firewall enablement in data Firewall manager call flow**

1. Application requests data factory for data firewall manager object. 1.1. If firewall manager object does not exist, data factory will create new object.
2. Data factory returns shared pointer to firewall manager object to application.
3. Application request current service status of firewall manager returned by data factory.
4. Firewall manager returns current service status. 4.1 If status returned is `SERVICE_UNAVAILABLE` (manager is not ready), application should wait for init callback provided in step 1. 4.2 Firewall manager calls application callback with initialization result (success/failure).
5. On success, application calls firewall manager `setFirewall` with enable/disable and allow/drop packets.
6. Application receives synchronous Status which indicates if the firewall manager `setFirewall` request was sent successfully.
7. Application is notified of the Status of the firewall manager `setFirewall` request (either `SUCCESS` or `FAILED`) via the application-supplied callback.

### 3.5.5.8 Add Firewall Entry in data Firewall manager call flow

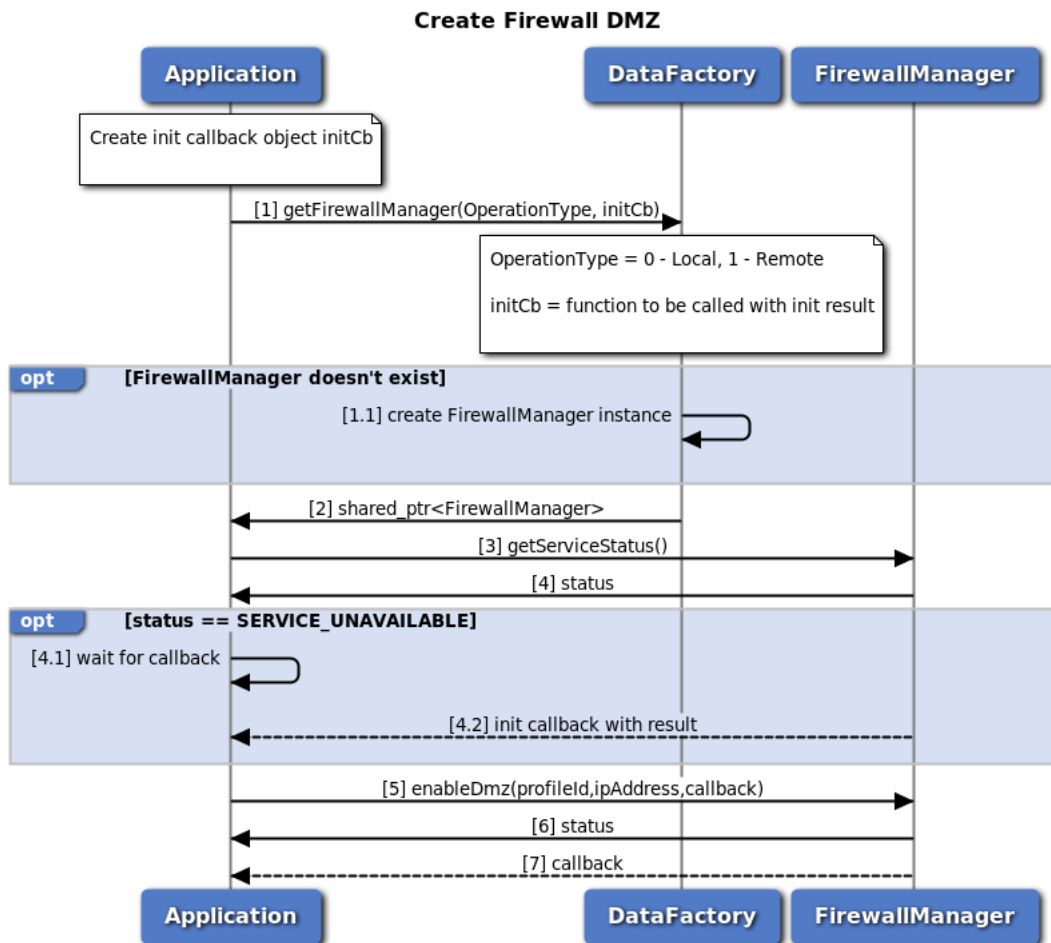

**Figure 3-61 Add Firewall entry in data Firewall manager call flow**

1. Application requests data factory for data firewall manager object. 1.1. If firewall manager object does not exist, data factory will create new object.
2. Data factory returns shared pointer to firewall manager object to application.
3. Application request current service status of data profile manager returned by data factory.
4. Firewall manager returns current service status. 4.1 If status returned is `SERVICE_UNAVAILABLE` (manager is not ready), application should wait for init callback provided in step 1. 4.2 Firewall manager calls application callback with initialization result (success/failure).
5. On success, application calls firewall manager `getNewFirewallEntry` to get `FirewallEntry` object.

6. Application receives Firewall Entry object.
7. Using Firewall Entry object, application calls `IFirewallEntry::getProtocolFilter` to get protocol filter object
8. Application receives `IpFilter` object.
9. Application populates `FirewallEntry` and `IpFilter` objects.
10. Application calls `IFirewallManager::addFirewallEntry` with `profileId` and `FirewallEntry` to add firewall entry
11. Application receives synchronous `Status` which indicates if `addFirewallEntry` was sent successfully
12. Application is notified of the `Status` of the `IFirewallManager::addFirewallEntry` request (either `SUCCESS` or `FAILED`) via the application-supplied callback.

### 3.5.5.9 Set Firewall DMZ in data Firewall manager call flow

**Figure 3-62 Set Firewall DMZ in data Firewall manager call flow**

1. Application requests data factory for data firewall manager object. 1.1. If firewall manager object does not exist, data factory will create new object.
2. Data factory returns shared pointer to firewall manager object to application.

3. Application request current service status of firewall manager returned by data factory.
4. Firewall manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Firewall manager calls application callback with initialization result (success/failure).
5. On success, application calls firewall manager enableDmz with profileId and IP Address.
6. Application receives synchronous Status which indicates if the firewall manager enableDmz request was sent successfully.
7. Application is notified of the Status of the firewall manager enableDmz request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.5.5.10 Socks Enablement in data Socks manager call flow

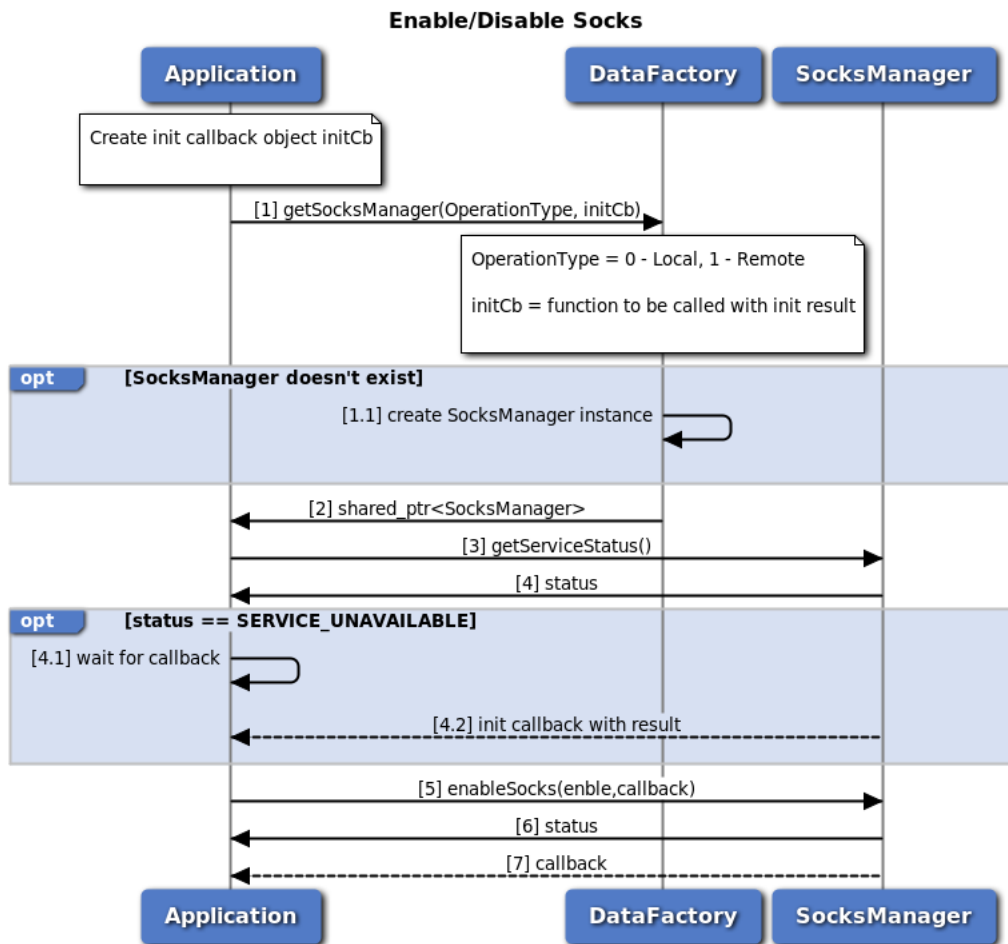

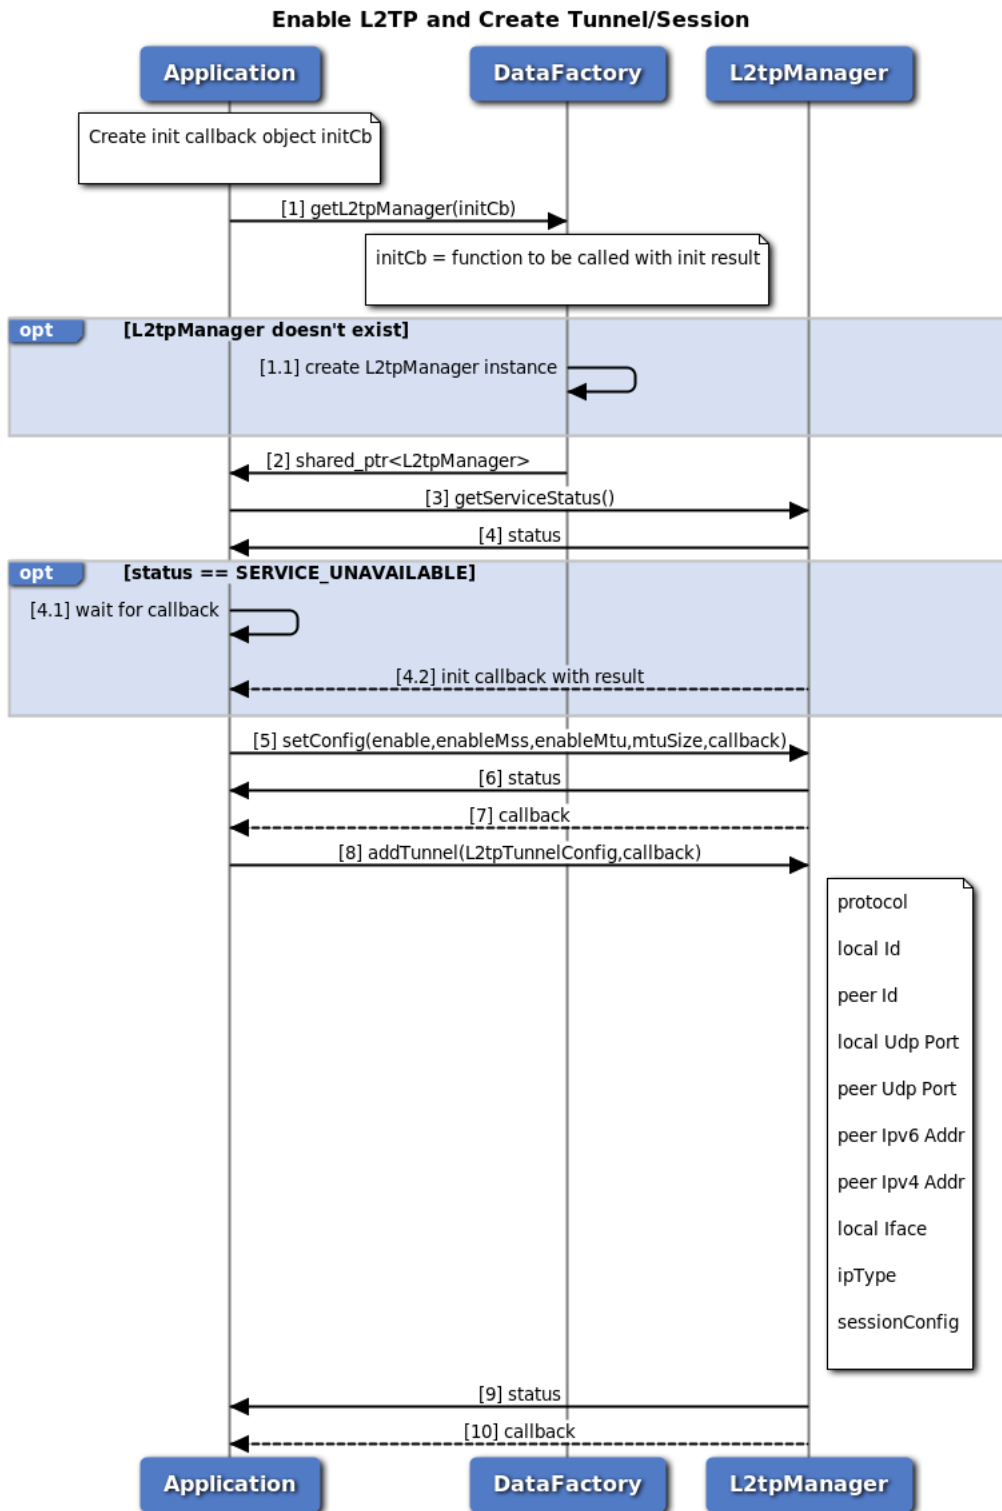

Figure 3-63 Socks enablement in data Socks manager call flow

1. Application requests data factory for data socks manager object. 1.1. If socks manager object does not exist, data factory will create new object.
2. Data factory returns shared pointer to socks manager object to application.
3. Application request current service status of socks manager returned by data factory.

4. Socks manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Socks manager calls application callback with initialization result (success/failure).
5. On success, application calls socks manager enableSocks with enable/disable.
6. Application receives synchronous Status which indicates if the socks manager enableSocks request was sent successfully.
7. Application is notified of the Status of the socks manager enableSocks request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.5.5.11 L2TP Enablement and Configuration in data L2TP manager call flow

**Figure 3-64 L2TP enablement and Configuration in data L2TP manager call flow**

1. Application requests data factory for data l2tp manager object. 1.1. If l2tp manager object does not exist, data factory will create new object.

2. Data factory returns shared pointer to l2tp manager object to application.
3. Application request current service status of l2tp manager returned by data factory.
4. L2tp manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 L2tp manager calls application callback with initialization result (success/failure).
5. On success, application calls l2tp manager setConfig with enable/disable, enable/disable Mss, enable/disable MTU size and MTU size
6. Application receives synchronous Status which indicates if the l2tp manager setConfig request was sent successfully.
7. Application is notified of the Status of the l2tp manager setConfig request (either SUCCESS or FAILED) via the application-supplied callback.
8. Application calls l2tp manager setConfig with all required configurations to setup tunnel and session
9. Application receives synchronous Status which indicates if the l2tp manager setConfig request was sent successfully.
10. Application is notified of the Status of the l2tp manager setConfig request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.5.5.12 Call flow to add and enable software bridge

**Figure 3-65 Call flow to add and enable a software bridge**

1. Application requests data factory for bridge manager object.
2. Data factory returns shared pointer to bridge manager object to application.
3. Application request current service status of bridge manager returned by data factory.
4. Bridge manager returns current service status. 4.1 If status returned is `SERVICE_UNAVAILABLE` (manager is not ready), application should wait for init callback provided in step 1. 4.2 Bridge manager calls application callback with initialization result (success/failure).
5. On success, application requests to add software bridge configuration for an interface, providing an optional asynchronous response callback using `addBridge` API.
6. Application receives the synchronous status i.e. either `SUCCESS` or `FAILED` which indicates if the request was sent successfully.
7. Optionally, the application gets asynchronous response for `addBridge` via the application-supplied callback.

8. If the software bridge management is not enabled already, application requests to enable it, providing an optional asynchronous response callback using enableBridge API. Please note that this step affects all the software bridges configured in the system.
9. Application receives the status i.e. either SUCCESS or FAILED which indicates if the request was sent successfully.
10. Optionally, the application gets asynchronous response for enableBridge via the application-supplied callback.

### 3.5.5.13 Call flow to remove and disable software bridge

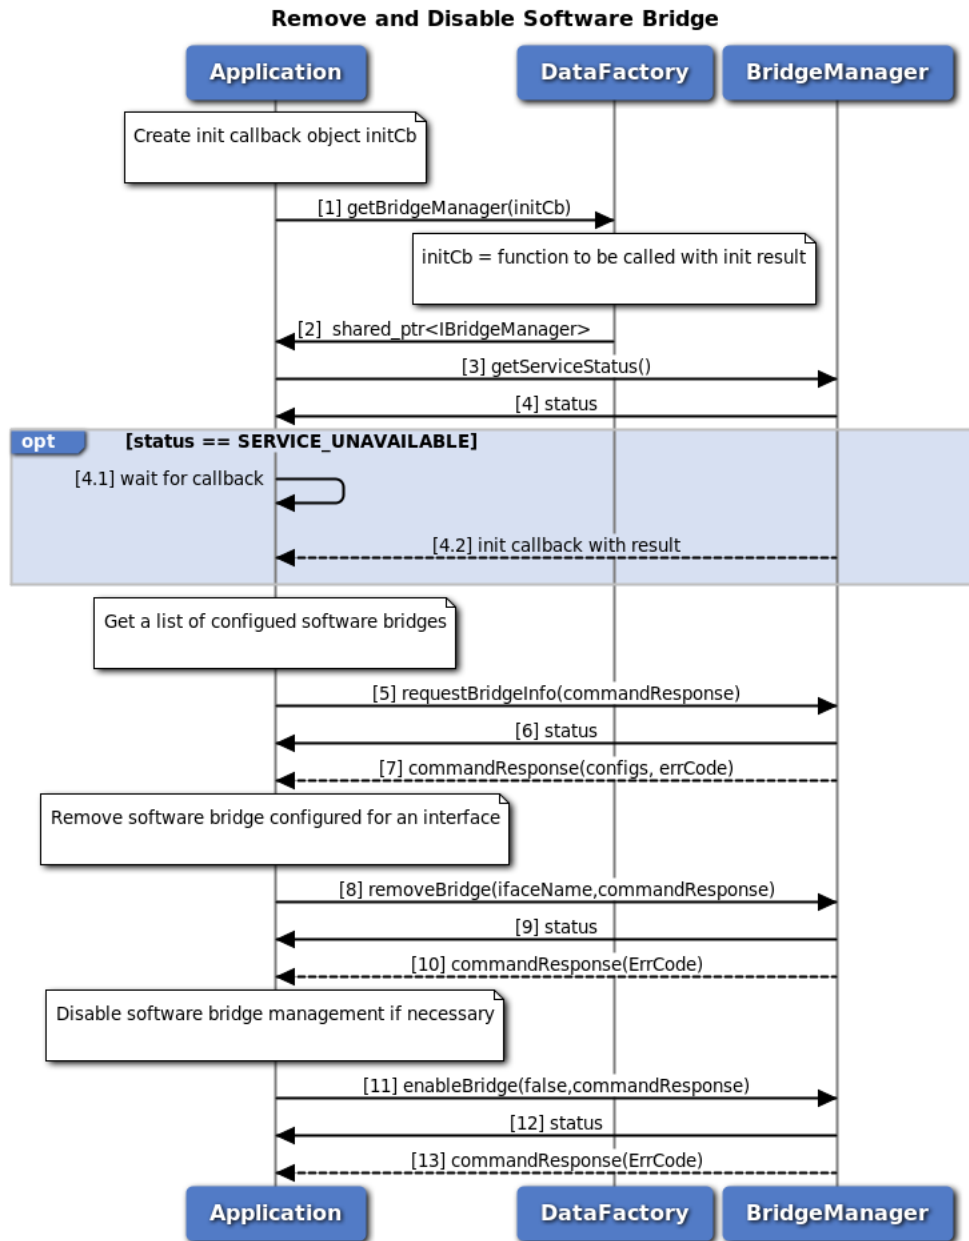

Figure 3-66 Call flow to remove and disable a software bridge

1. Application requests data factory for bridge manager object.
2. Data factory returns shared pointer to bridgeManager object to application.
3. Application request current service status of bridge manager returned by data factory.
4. Bridge manager returns current service status. 4.1 If status returned is SERVICE\_UNAVAILABLE (manager is not ready), application should wait for init callback provided in step 1. 4.2 Bridge manager calls application callback with initialization result (success/failure).
5. On success, application requests to get the list of software bridge configurations, providing an asynchronous response callback using requestBridgeInfo API.
6. Application receives the synchronous status i.e. either SUCCESS or FAILED which indicates if the request was sent successfully.
7. The application gets asynchronous response for requestBridgeInfo via the application-supplied callback.
8. Application requests to remove software bridge configuration for an interface, providing an optional asynchronous response callback using removeBridge API.
9. Application receives the synchronous status i.e. either SUCCESS or FAILED which indicates if the request was sent successfully.
10. Optionally, the application gets asynchronous response for removeBridge via the application-supplied callback.
11. If the software bridge management needs to be disabled, application requests to disable it, providing an optional asynchronous response callback using enableBridge API. Please note that this step affects all the software bridges configured in the system.
12. Application receives the status i.e. either SUCCESS or FAILED which indicates if the request was sent successfully.
13. Optionally, the application gets asynchronous response for enableBridge via the application-supplied callback.

## 3.6 C-V2X

Applications need to have "radio" Linux group permissions to be able to operate successfully with underlying services.

### 3.6.1 Retrieve/Update C-V2X Configuration

Figure 3-67 Retrieve/Update C-V2X Configuration Call Flow - C++ version

This call flow diagram describes the sequence of steps for retrieving or updating C-V2X configuration file using C++ version APIs.

1. Application requests for a ICv2xFactory instance.
2. Reference to singleton ICv2xFactory is returned to application.
3. Application requests C-V2X factory for a ICv2xConfig instance.
4. C-V2X factory creates ICv2xConfig object and calls init() method of ICv2xConfig.
5. C-V2X config starts initialization asynchronously.
6. C-V2X factory return ICv2xConfig object to application.
7. C-V2X factory is asynchronously notified of the readiness status of the C-V2X config via the initialization callback.
8. C-V2X factory calls application-supplied callback to notify the readiness status of C-V2X config (either SERVICE\_AVAILABLE or SERVICE\_FAILED). If the status is SERVICE\_AVAILABLE, application can then request to retrieve or update C-V2X configuration.
9. Application requests to retrieve C-V2X configuration by calling retrieveConfiguration and supplying it with a path for the storing of config XML file.
10. C-V2X config sends request to modem and waits for response asynchronously.
11. Application receives synchronous status.
12. Application is asynchronously notified of the status of the request (either SUCCESS or FAILED) via the application-supplied callback.
13. Application requests to update C-V2X configuration by calling updateConfiguration and supplying it with a path to the new config XML file.
14. C-V2X config sends request to modem and waits for response asynchronously.
15. Application receives synchronous status.
16. Application is asynchronously notified of the status of the request (either SUCCESS or FAILED) via the application-supplied callback.
17. Application registers ICv2xConfigListener to get notification of C-V2X configuration events if needed.
18. Application receives synchronous status.
19. Application gets notification of C-V2X configuration events if the C-V2X configuration being used in the system has been changed or expired.
20. Application deregisters ICv2xConfigListener to stop listening to C-V2X configuration events.
21. Application receives synchronous status.

**Figure 3-68 Retrieve/Update C-V2X Configuration Call Flow - C Version**

This call flow diagram describes the sequence of steps for retrieving or updating C-V2X configuration file using C version APIs.

1. Application requests to retrieve C-V2X configuration by calling `v2x_retrieve_configuration` and supplying it with a path for the storing of config XML file.
2. Application receives synchronous status.
3. Application requests to update C-V2X configuration by calling `v2x_update_configuration` and supplying it with a path to the new config file.
4. Application receives synchronous status.
5. Application registers `cv2x_config_event_listener` to get notification of C-V2X configuration events if needed.
6. Application receives synchronous status.
7. Application gets notification of C-V2X configuration events if the C-V2X configuration being used in the system has been changed or expired.

### 3.6.2 Start/Stop C-V2X Mode

**Figure 3-69 Start/Stop C-V2X Mode Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for starting or stopping C-V2X mode using C++ version APIs. Application must perform C-V2X radio manager initialization before calling any methods of ICv2xRadioManager. In normal operation, applications do not need to start or stop C-V2X mode. The system is configured by default to start C-V2X mode at boot. We include the call flow below for the sake of completeness.

1. Application requests to put modem into C-V2X mode using startCv2x method.
2. Application receives synchronous status which indicates if the start request was sent successfully.
3. Application is notified of the status of the start request (either SUCCESS or FAILED) via the application-supplied callback.
4. Application requests to disable C-V2X mode using stopCv2x method.
5. Application receives synchronous status which indicates if the stop request was sent successfully.
6. Application is asynchronously notified of the status of the stop request (either SUCCESS or FAILED) via the application-supplied callback.

**Figure 3-70 Start/Stop C-V2X Mode Call Flow - C Version**

This call flow diagram describes the sequence of steps for starting or stopping C-V2X mode using C version APIs.

1. Application requests to put modem into C-V2X mode using `start_v2x_mode` method.
2. Application receives synchronous status which indicates if the operation was successful.
3. Application requests to disable C-V2X mode using `stop_v2x_mode` method.
4. Application receives synchronous status which indicates if the operation was successful.

### 3.6.3 C-V2X Radio Control Flow

Figure 3-71 C-V2X Radio Control Flow - C++ Version

This call flow diagram describes the sequence of steps for overall C-V2X radio control flow using C++ version APIs.

1. Application performs C-V2X radio manager initialization and waits for the readiness. See steps 1~8 in [fig\\_cv2x\\_radio\\_initialization\\_callflow](#).
2. Application registers ICv2xListener to get C-V2X status update notification and requests for the initiate C-V2X status. See steps 1~6 in [fig\\_cv2x\\_get\\_status\\_callflow](#).
3. Application waits for C-V2X status to go to SUSPEND/ACTIVE.
4. Application performs C-V2X radio initialization and waits for the readiness. See steps 9~17 in [fig\\_cv2x\\_radio\\_initialization\\_callflow](#).
5. Application registers C-V2X radio listener to get C-V2X radio related notifications (L2 address update, SPS offset update, SPS scheduling update, C-V2X radio capabilities update) and requests for the initial C-V2X radio capabilities if needed. See steps 1~6 in [fig\\_cv2x\\_get\\_capabilities\\_callflow](#).

6. Application registers all Tx/Rx flows. See [fig\\_cv2x\\_radio\\_rx\\_sub\\_callflow/fig\\_cv2x\\_radio\\_event\\_↔\\_flow\\_callflow/fig\\_cv2x\\_radio\\_sps\\_flow\\_callflow](#).
7. Application monitors C-V2X status change during operation.
  - 7.1 If C-V2X Tx/Rx status is active, application performs transmitting/receiving.
  - 7.2 If C-V2X Tx/Rx status goes to SUSPEND, application should suspend transmitting/receiving, log the event and resume operation when C-V2X Tx/Rx status goes to ACTIVE again.
  - 7.3 If C-V2X Tx/Rx status goes to INACTIVE, application should stop transmitting/receiving, log the event and go back to step 3 for recovery.
8. Application should handle all trappable signals like SIGINT/SIGHUP/SIGTERM, all Tx/Rx flows must be deregistered before exiting.

Figure 3-72 C-V2X Radio Control Flow - C Version

This call flow diagram describes the sequence of steps for overall C-V2X radio control flow using C version APIs.

1. Application performs C-V2X radio initialization and waits for the readiness in application provided

- callback. See [fig\\_cv2x\\_radio\\_initialization\\_callflow\\_c](#). Application should check the C-V2X radio initialization status, retry or exit if failing.
2. Application registers `v2x_ext_radio_status_listener` to get C-V2X status update notification and requests for the initiate C-V2X status. See steps 1~5 in [fig\\_cv2x\\_get\\_status\\_callflow\\_c](#).
  3. Application waits for C-V2X status to go to SUSPEND/ACTIVE.
  4. Application requests for the initial C-V2X radio capabilities if needed. See [fig\\_cv2x\\_get\\_capabilities\\_callflow\\_c](#).
  5. Application registers all Tx/Rx flows. See [fig\\_cv2x\\_radio\\_rx\\_sub\\_callflow\\_c](#)/[fig\\_cv2x\\_radio\\_↔event\\_flow\\_callflow\\_c](#)/[fig\\_cv2x\\_radio\\_sps\\_flow\\_callflow\\_c](#).
  6. Application monitors C-V2X status change during operation.
    - 6.1 If C-V2X Tx/Rx status is active, application performs transmitting/receiving.
    - 6.2 If C-V2X Tx/Rx status goes to SUSPEND, application should suspend transmitting/receiving, log the event and resume operation when C-V2X Tx/Rx status goes to ACTIVE again.
    - 6.3 If C-V2X Tx/Rx status goes to INACTIVE, application should stop transmitting/receiving, log the event, wait for C-V2X Tx/Rx status to go to SUSPEND or ACTIVE and then go back to step 1 for recovery.
  7. Application should handle all trappable signals like SIGINT/SIGHUP/SIGTERM, all Tx/Rx flows must be deregistered before exiting.

### 3.6.4 C-V2X Radio Initialization

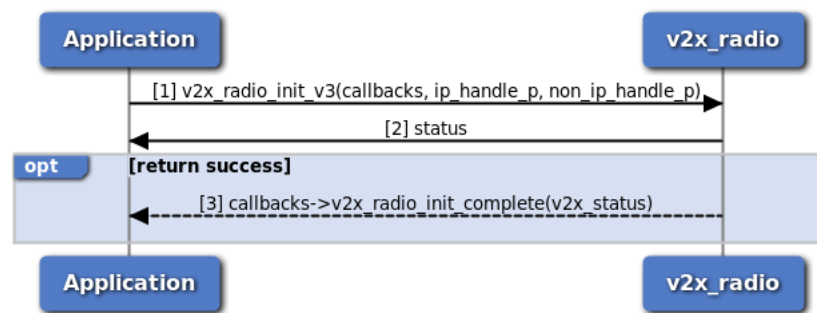

**Figure 3-73 C-V2X Radio Initialization Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for initializing the ICv2xRadioManager and the ICv2xRadio object using C++ version APIs. Applications must initialize ICv2xRadioManager/ICv2xRadio object and wait for the readiness before calling any other methods on the objects.

1. Application requests for a ICv2xFactory instance.
2. Reference to singleton ICv2xFactory is returned to application.
3. Application requests C-V2X factory for an ICv2xRadioManager instance.
4. C-V2X factory creates ICv2xRadioManager object and calls init() method of ICv2xRadioManager.
5. C-V2X radio manager starts initialization asynchronously.
6. C-V2X factory returns ICv2xRadioManager object to application.

7. C-V2X factory is asynchronously notified of the readiness status of the C-V2X radio manager via the initialization callback.
8. C-V2X factory calls application-supplied callback to notify the readiness status of C-V2X radio manager (either SERVICE\_AVAILABLE or SERVICE\_FAILED).
9. Application requests C-V2X Radio from ICv2xRadioManager.
10. C-V2X radio manager creates ICv2xRadio object and calls method init().
11. C-V2X radio starts initialization asynchronously.
12. C-V2X radio manager returns ICv2xRadio object to application.
13. Application queries C-V2X radio's readiness state using isReady() method.
14. C-V2X radio returns a bool indicating whether it is ready to be used.
15. If C-V2X radio is not ready, the application calls onReady() method.
16. C-V2X radio returns a future object.
17. Application calls future's get() method and blocks until C-V2X radio has completed its initialization steps. The return value of get() indicates the status of the initialization (either SUCCESS or FAILED).

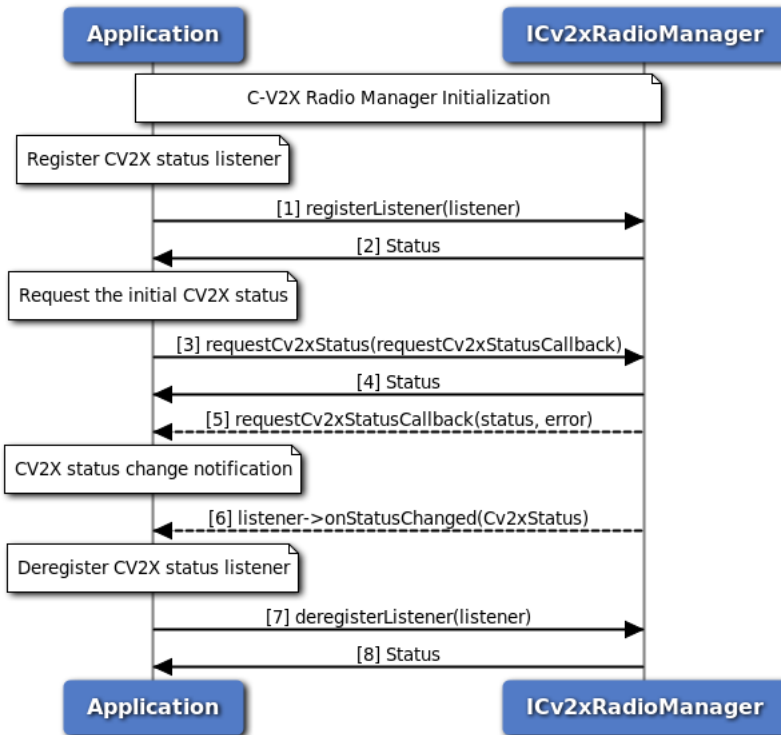

**Figure 3-74 C-V2X Radio Initialization Call Flow - C Version**

This call flow diagram describes the sequence of steps for initializing C-V2X radio using C version APIs. Applications must initialize C-V2X radio and wait for the readiness before calling any other methods of C-V2X radio.

1. Application calls `v2x_radio_init_v3` to initialize C-V2X radio manager and radio, provides callback functions as needed. Callback function `v2x_radio_init_complete` is mandatory for getting the C-V2X radio initialization status.
2. Application gets return value (0 on success or negative value on error). If the return value is success, the handles of C-V2X IP and non-IP radio interface are provided via the application-supplied pointers `ip_handle_p` and `non_ip_handle_p`. The interface handles can be used to specify IP or non-IP traffic type when registering C-V2X radio Tx/Rx flows.
3. Application gets the notification of C-V2X radio initialization status (`V2X_STATUS_SUCCESS` or `V2X_STATUS_FAIL`) via the application-supplied `v2x_radio_init_complete` callback function if the return value of `v2x_radio_init_v3` is successful.

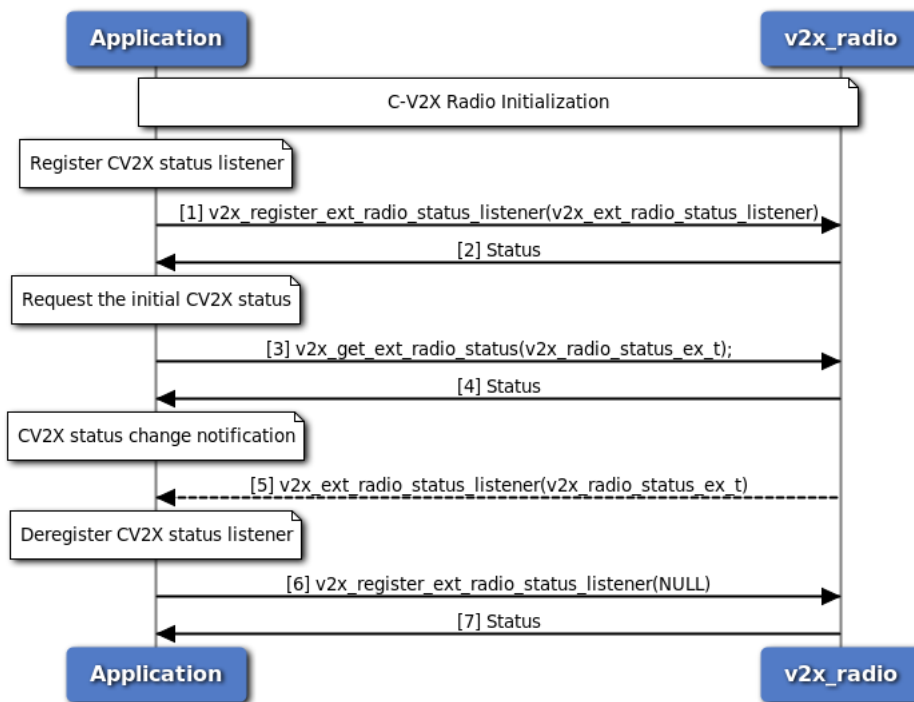

### 3.6.5 Get C-V2X Status

**Figure 3-75 Get C-V2X Status Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for getting C-V2X radio status using C++ version APIs. Application must perform C-V2X radio manager initialization before calling any methods of ICv2xRadioManager.

1. Application registers a listener for getting notifications of C-V2X status update.
2. Status of register listener (either SUCCESS or FAILED) will be returned to the application.
3. Application requests the initial C-V2X status using requestCv2xStatus method.
4. Application receives synchronous status (either SUCCESS or FAILED) which indicates if the request was sent successfully.
5. Application is asynchronously notified of the status of the request (either SUCCESS or FAILED) via the application-supplied callback. If success, current C-V2X status is supplied via callback.
6. Application gets notification of C-V2X status update via method onStatusChanged of ICv2xRadioListener.
7. Application deregister the listener.
8. Status of deregistering listener (either SUCCESS or FAILED) will be returned to the application.

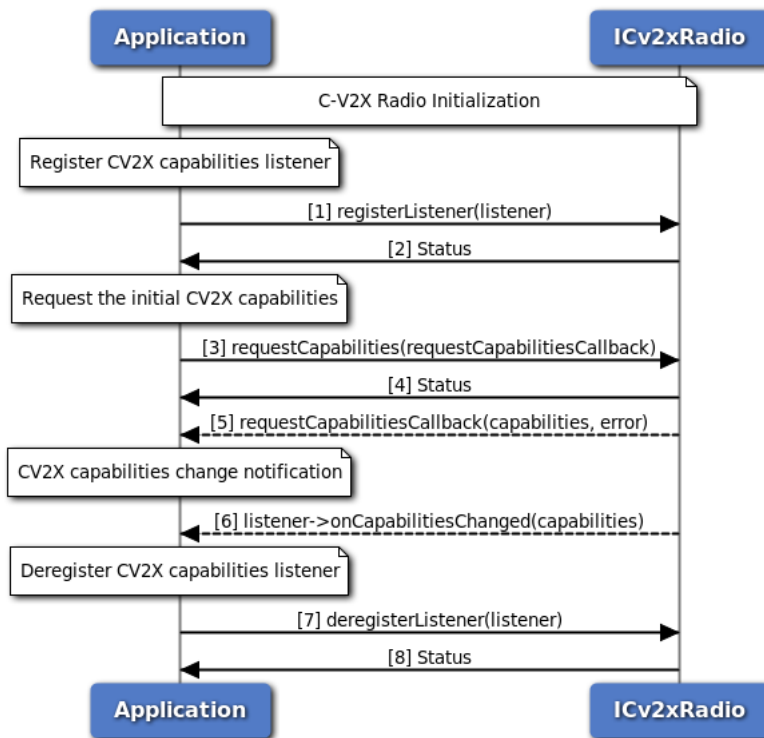

**Figure 3-76 Get C-V2X Status Call Flow - C Version**

This call flow diagram describes the sequence of steps for getting C-V2X radio status using C version APIs. Application must perform C-V2X radio initialization before calling any methods of C-V2X radio.

1. Application registers a listener for getting notifications of C-V2X status update.
2. Application gets the return value (V2X\_STATUS\_SUCCESS or V2X\_STATUS\_FAIL) which indicates if the operation was successfully performed. If it succeeded, the C-V2X overall status and per pool status are provided via the application-supplied pointer.
3. Application requests the initial C-V2X status using `v2x_get_ext_radio_status` method.
4. Application gets the return value (V2X\_STATUS\_SUCCESS or V2X\_STATUS\_FAIL) which indicates if the operation was successfully performed.
5. Application gets notification of C-V2X status update.
6. Application deregister the listener via setting a NULL listener.
7. Application gets the return value (V2X\_STATUS\_SUCCESS or V2X\_STATUS\_FAIL) which indicates if the operation was successfully performed.

### 3.6.6 Get C-V2X Capabilities

**Figure 3-77 Get C-V2X Capabilities Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for getting C-V2X radio capabilities using C++ version APIs. Application must perform C-V2X radio initialization before calling any methods of ICv2xRadio.

1. Application registers a listener for getting notifications of C-V2X capabilities update.
2. Status of register listener (either SUCCESS or FAILED) will be returned to the application.
3. Application requests the initial C-V2X capabilities using requestCapabilities method.
4. Application receives synchronous status (either SUCCESS or FAILED) which indicates if the request was sent successfully.
5. Application is asynchronously notified of the status of the request (either SUCCESS or FAILED) via the application-supplied callback. If success, current C-V2X capabilities is supplied via callback.
6. Application gets notification of C-V2X capabilities update via method onCapabilitiesChanged of ICv2xRadioListener.
7. Application deregister the listener.
8. Status of deregistering listener (either SUCCESS or FAILED) will be returned to the application.

**Figure 3-78 Get C-V2X Capabilities Call Flow - C Version**

This call flow diagram describes the sequence of steps for getting C-V2X radio capabilities using C version APIs. Application must perform C-V2X radio initialization and provide C-V2X capabilities callback to get C-V2X radio capabilities update notification.

1. Application requests the initial C-V2X capabilities using `v2x_radio_query_parameters` method.
2. Application gets the return value (`V2X_STATUS_SUCCESS` or `V2X_STATUS_FAIL`) which indicates if the operation was successfully performed. If it succeeded, C-V2X capabilities are provided via the application-supplied pointer.
3. Application gets notification of C-V2X capabilities update via application-supplied callback `v2x_radio_capabilities_listener`.

### 3.6.7 C-V2X Radio RX Subscription

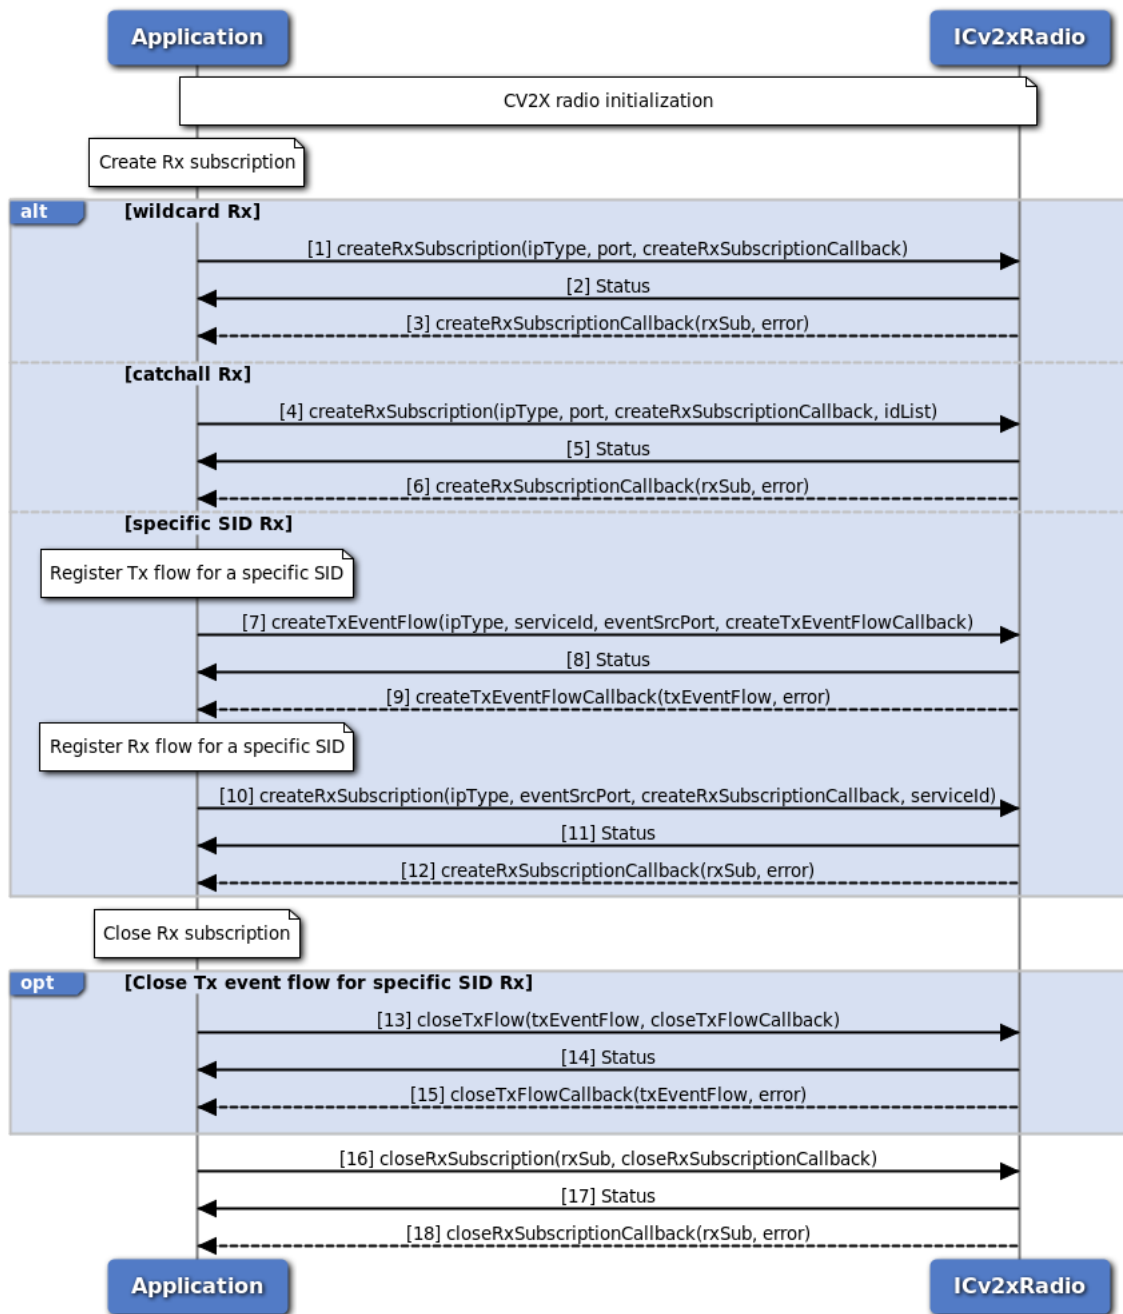

Figure 3-79 C-V2X Radio RX Subscription Call Flow - C++ Version

This call flow diagram describes the sequence of steps for registering or deregistering C-V2X Rx flows using C++ version APIs. Application must perform C-V2X radio initialization before calling any methods of ICv2xRadio.

There are three Rx modes supported for non-IP traffic,

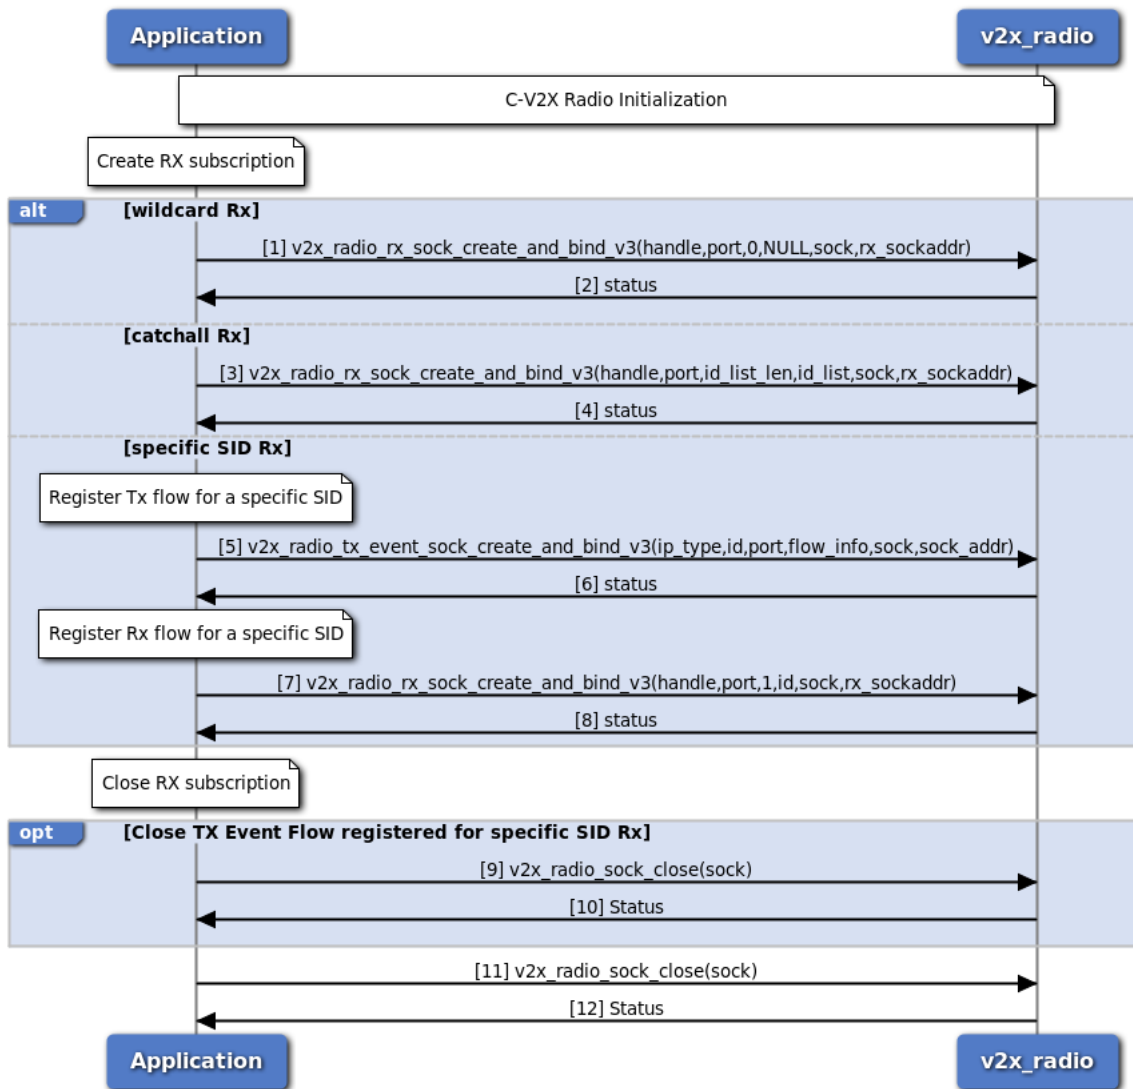

- Wildcard Rx: Receive all service IDs on a single port. This mode could break catchall Rx and specific service ID Rx.

- Catchall Rx: Receive the specified service IDs on a single port. This mode can be used for Rx-only devices for which no Tx flow need to be created.
- Specific service ID Rx: Receive a specified service ID on a single port. Application can receive different service IDs on different ports by registering a pair of Tx and Rx flows for each service ID.

**NOTE:** For catchall or specific service ID Rx mode, filtering for received broadcast packets is implemented in low layer based on the service ID and its mapped destination L2 address, assuming that each service ID is mapped to a unique destination L2 address for all Tx and Rx devices. If this assumption is not valid, for example, in ETSI standards all broadcast service IDs are using same destination L2 address 0xFFFFFFFF, then application should choose wildcard Rx method and do filtering in application layer.

1. Application requests to enable wildcard Rx mode by specifying no service ID when creating Rx flow.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request for creating Rx flow was sent successfully.
3. C-V2X radio sends asynchronous notification via the callback function on the status of the request for creating Rx flow. If SUCCESS, the RX flow is returned in the callback.
4. Application requests to enable catchall Rx mode by specifying a valid service ID list when creating Rx flow.
5. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request for creating Rx flow was sent successfully.
6. C-V2X radio sends asynchronous notification via the callback function on the status of the request for creating Rx flow. If SUCCESS, the RX flow is returned in the callback.
7. Application requests to create a Tx event flow before creating Rx flow to enable specific service ID Rx mode. The service ID and the port number of Tx and Rx flow should be the same.
8. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request for creating Tx flow was sent successfully.
9. C-V2X radio sends asynchronous notification via the callback function on the status of creating Tx flow. If SUCCESS, the TX event flow is returned in the callback.
10. Application requests to enable specific service ID Rx mode if the corresponding Tx flow has been registered successfully.
11. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request for creating Rx flow was sent successfully.
12. C-V2X radio sends asynchronous notification via the callback function on the status of the request for creating Rx flow. If SUCCESS, the RX flow is returned in the callback.
13. Application requests to closes the Tx event flow registered for specific service ID Rx mode.
14. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request for closing Tx flow was sent successfully.
15. C-V2X radio sends asynchronous notification via the callback function on the status of closing Tx flow.
16. Application requests to close the RX flow.
17. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request for closing Rx flow was sent successfully.
18. C-V2X radio sends asynchronous notification via the callback (if a callback was specified) indicating

the status of closing Rx flow.

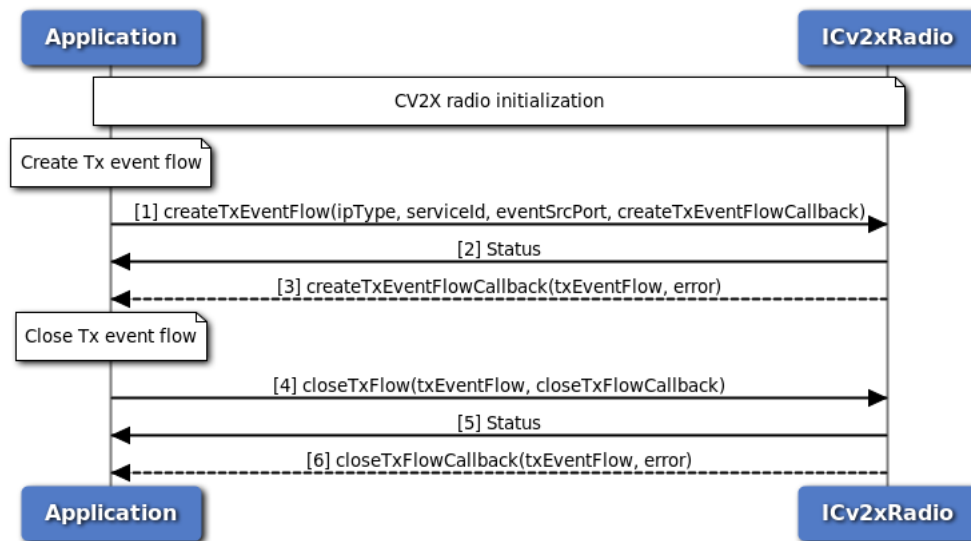

**Figure 3-80 C-V2X Radio RX Subscription Call Flow - C Version**

This call flow diagram describes the sequence of steps for registering or deregistering C-V2X Rx flows using C version APIs. Application must perform C-V2X radio initialization before calling any methods of C-V2X radio.

1. Application requests to enable wildcard Rx mode by specifying no service ID when creating Rx flow.
2. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the Rx flow creation was successful.
3. Application requests to enable catchall Rx mode by specifying a valid service ID list when creating Rx flow.
4. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the Rx flow creation was successful.
5. Application registers a Tx event flow before creating Rx flow to enable specific service ID Rx mode. The service ID and the port number of Tx and Rx flow should be the same.

6. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the Tx event flow registration was successful.
7. Application requests to enable specific service ID Rx mode if the corresponding Tx flow has been registered successfully.
8. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the Rx flow creation was successful.
9. Application requests to closes the Tx event flow registered for specific service ID Rx mode.
10. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the Tx flow has been closed successfully.
11. Application requests to close the Rx flow.
12. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the Rx flow has been closed successfully.

### 3.6.8 C-V2X Radio TX Event Flow

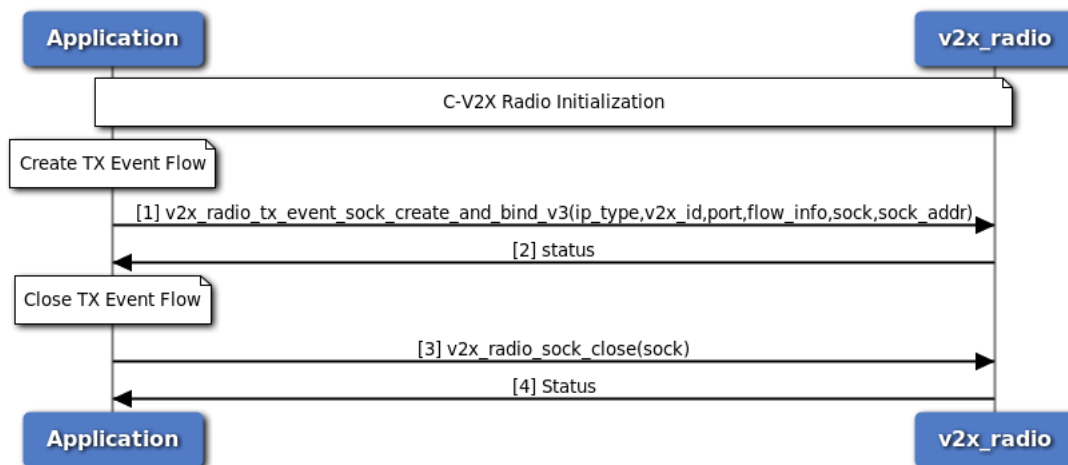

**Figure 3-81 C-V2X Radio TX Event Flow Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for registering or deregistering C-V2X Tx event flows using C++ version APIs. Application must perform C-V2X radio initialization before calling any methods of ICv2xRadio.

1. Application requests a new TX event flow from the C-V2X radio using createTxEventFlow method.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
3. C-V2X radio sends asynchronous notification via the callback function on the status of the request. If SUCCESS, the TX event flow is returned in the callback.
4. Application requests to close the TX event flow.
5. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.

- C-V2X radio sends asynchronous notification via the callback (if a callback was specified) indicating the status of the request.

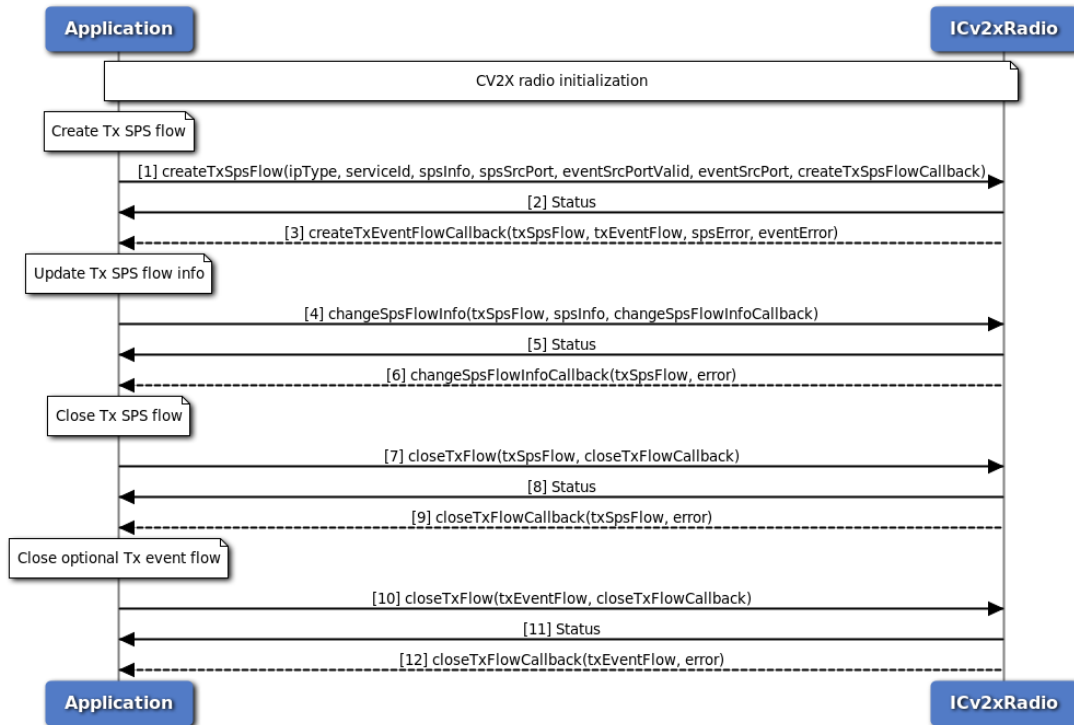

**Figure 3-82 C-V2X Radio TX Event Flow Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for registering or deregistering C-V2X Tx event flows using C version APIs. Application must perform C-V2X radio initialization before calling any methods of C-V2X radio.

- Application requests a new TX event flow from the C-V2X radio using `v2x_radio_tx_event_sock_create_and_bind_v3` method and specifies the IP or non-IP traffic type, C-V2X service ID, port number, event flow information and pointers that that point to the created socket and socket address on success.
- Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the operation was successfully performed. If the return value is 0, application gets the socket value from the application-supplied pointer and then starts sending C-V2X data packets using the socket.
- Application requests to close the RX subscription by calling method `v2x_radio_sock_close` and supplying with a pointer that points to the TX socket created.
- Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the operation was successfully performed

### 3.6.9 C-V2X Radio TX SPS flow

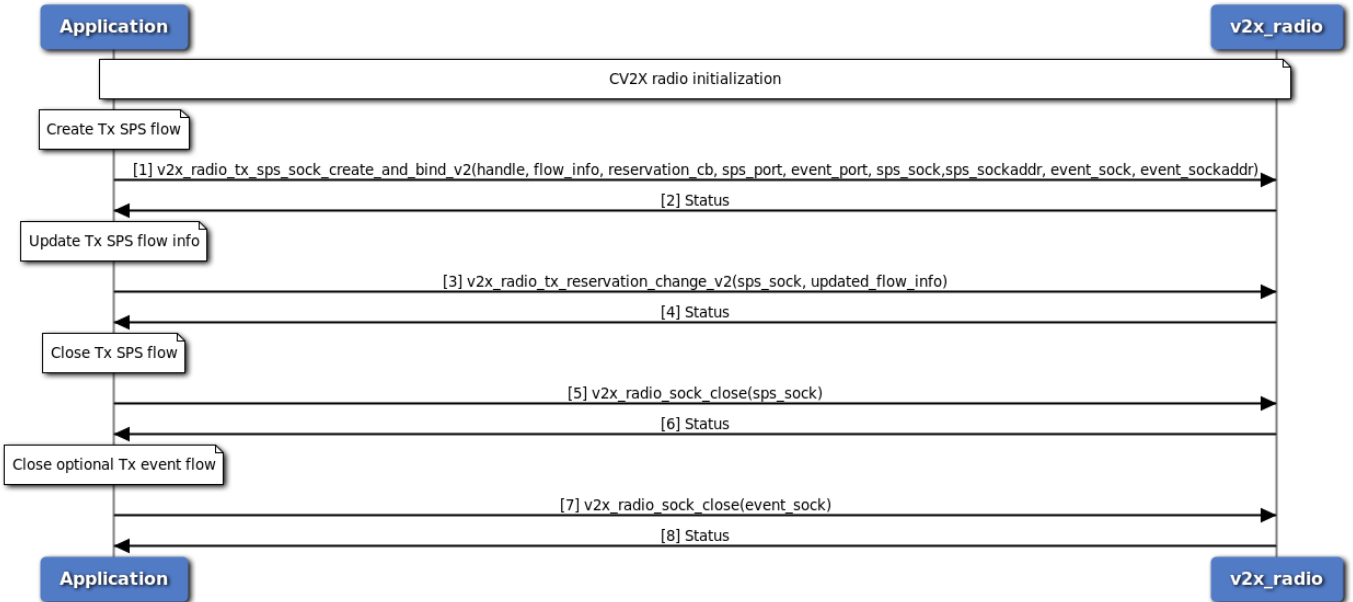

**Figure 3-83 C-V2X Radio SPS Flow Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for registering or deregistering C-V2X Tx SPS flows using C++ version APIs. Application must perform C-V2X radio initialization before calling any methods of ICv2xRadio. Only 2 Tx SPS flows are allowed in maximum in the system.

1. Application requests a new TX SPS flow from the C-V2X radio using createTxSPSFlow method. The application can also specify an optional Tx event flow.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
3. C-V2X radio sends asynchronous notification via the callback function. The callback will return the Tx SPS flow and its status as well as the optional Tx event flow and its status.
4. Application requests to change the SPS parameters using the changeSpsFlowInfo method.
5. Application received synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
6. C-V2X radio sends asynchronous notification via the callback (if callback was specified) indicating the status of the request.
7. Application requests to close the SPS flow.
8. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
9. C-V2X radio sends asynchronous notification via the callback (if a callback was specified) indicating the status of the request.

10. Application requests to close optional Tx event flow (if one was created).
11. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
12. C-V2X radio sends asynchronous notification via the callback (if a callback was specified) indicating the status of the request.

**Figure 3-84 C-V2X Radio SPS Flow Call Flow - C Version**

This call flow diagram describes the sequence of steps for registering or deregistering C-V2X Tx SPS flows using C version APIs. Application must perform C-V2X radio initialization before calling any methods of C-V2X radio. Only 2 Tx SPS flows are allowed in maximum in the system.

1. Application requests a new TX SPS flow from the C-V2X radio using `v2x_radio_tx_sps_sock_create_and_bind_v2` method. The application can also specify an optional Tx event flow.
2. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the sps flow was created successfully.
3. Application requests to change the SPS parameters using the `v2x_radio_tx_reservation_change_v2` method.
4. Application received synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the sps flow was updated successfully.
5. Application requests to close the SPS flow.
6. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the sps flow was closed successfully.
7. Application requests to close optional Tx event flow (if one was created).
8. Application receives synchronous status (either 0 on SUCCESS or negative values if FAILED) indicating whether the event flow was closed successfully.

### 3.6.10 C-V2X Throttle Manager Filter rate adjustment notification flow

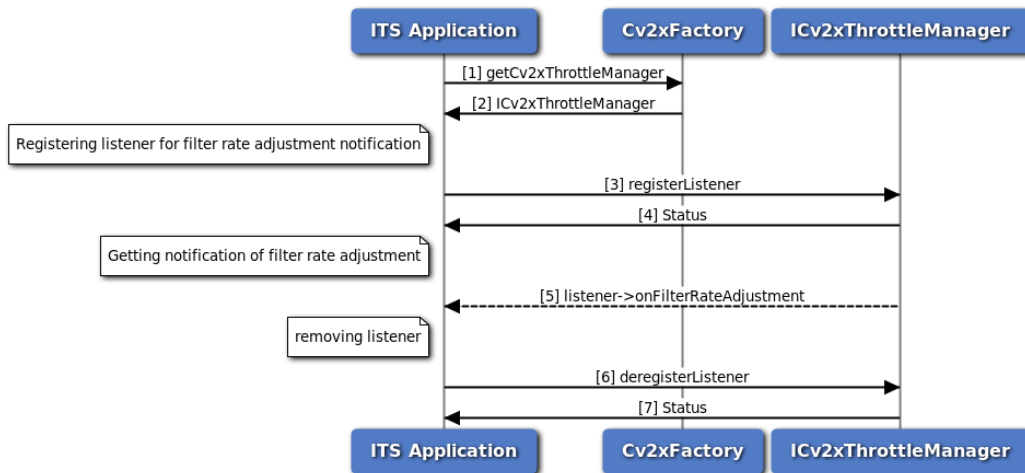

Figure 3-85 C-V2X Throttle Manager Filter Rate Adjustment Notification call flow

1. Application requests C-V2X factory for a C-V2X Throttle Manager.
2. C-V2X factory return ICv2xThrottleManager object to application.
3. Application register a listener for getting notifications of filter rate update.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application will get filter rate updates, positive value indicates to the application to filter more messages, and negative value indicates to the application to filter less messages
6. Application deregister the listener.
7. Status of deregistering listener, i.e. either SUCCESS or FAILED will be returned.

### 3.6.11 C-V2X Throttle Manager set verification load flow

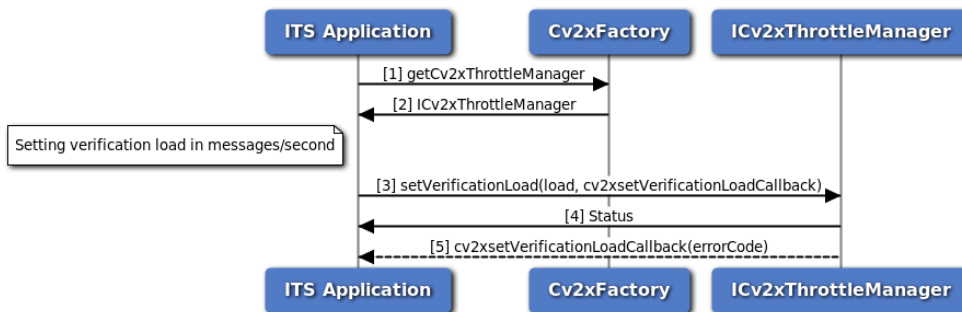

Figure 3-86 C-V2X Throttle Manager set verification call flow

1. Application requests C-V2X factory for a C-V2X Throttle Manager.
2. C-V2X factory return ICv2xThrottleManager object to application.
3. Application set verification load using setVerificationLoad method.

4. Application receives synchronous status which indicates if the request was sent successfully.
5. Application is notified of the status of the request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.6.12 C-V2X TX Status Report

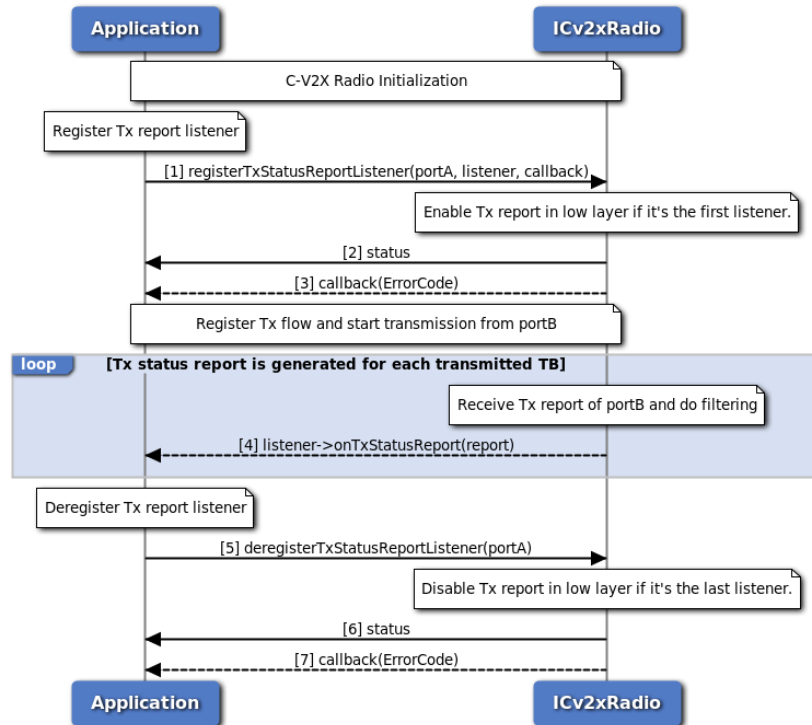

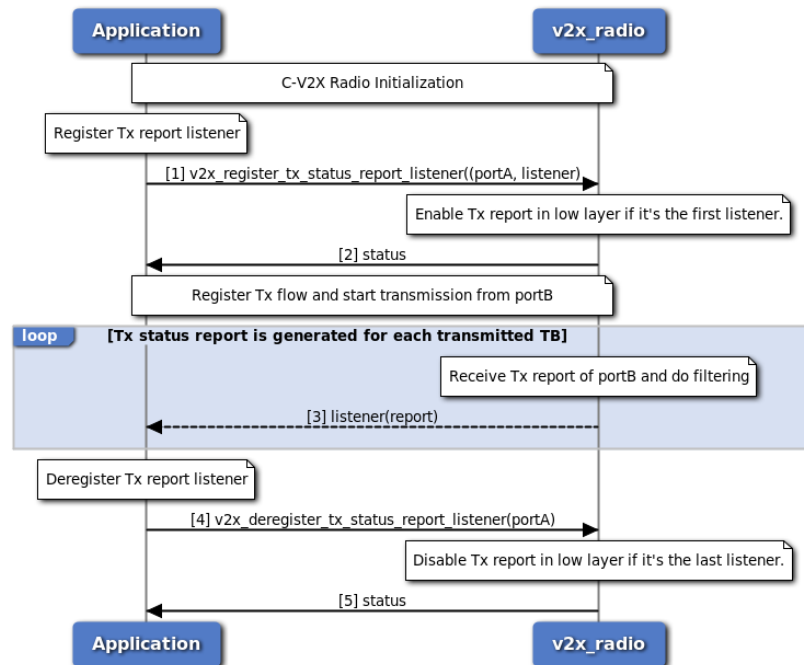

Figure 3-87 C-V2X TX Status Report Call Flow - C++ Version

This call flow diagram describes the sequence of steps for getting C-V2X Tx Status report per transport block using C++ version APIs. Application must perform C-V2X radio initialization before calling any methods of ICv2xRadio.

1. Application requests to register a listener for Tx status report, providing the interested port number(portA) of Tx status reports, the listener for receiving the reports and the callback function that used for notification of the result. C-V2X radio enables Tx status report in low layer if its the first request for registering Tx status report.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
3. C-V2X radio sends asynchronous notification via the callback function indication the status of the request.
4. Tx status report is generated for each transport block transmitted, the portB included in Tx status report indicates which source port the specific transport block is sent from, it can be used to associate the Tx status report with a Tx SPS/Event flow. C-V2X radio filters received Tx status reports based on the port of the listener (portA) and the port included in Tx status report (portB):
  - If portA is 0, no filtering to the Tx status reports, application gets Tx status reports for all transport blocks.

- If portA is not 0 and it equals to portB, application only gets Tx status reports for transport blocks being sent from the specified port.
  - In other cases, Tx status reports are not sent to application.
5. Application deregister listener for Tx status report. If it is the last listener for Tx status report in the system, C-V2X radio disables Tx status report in low layer.
  6. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
  7. C-V2X radio sends asynchronous notification via the callback (if callback was specified) indicating the status of the request.

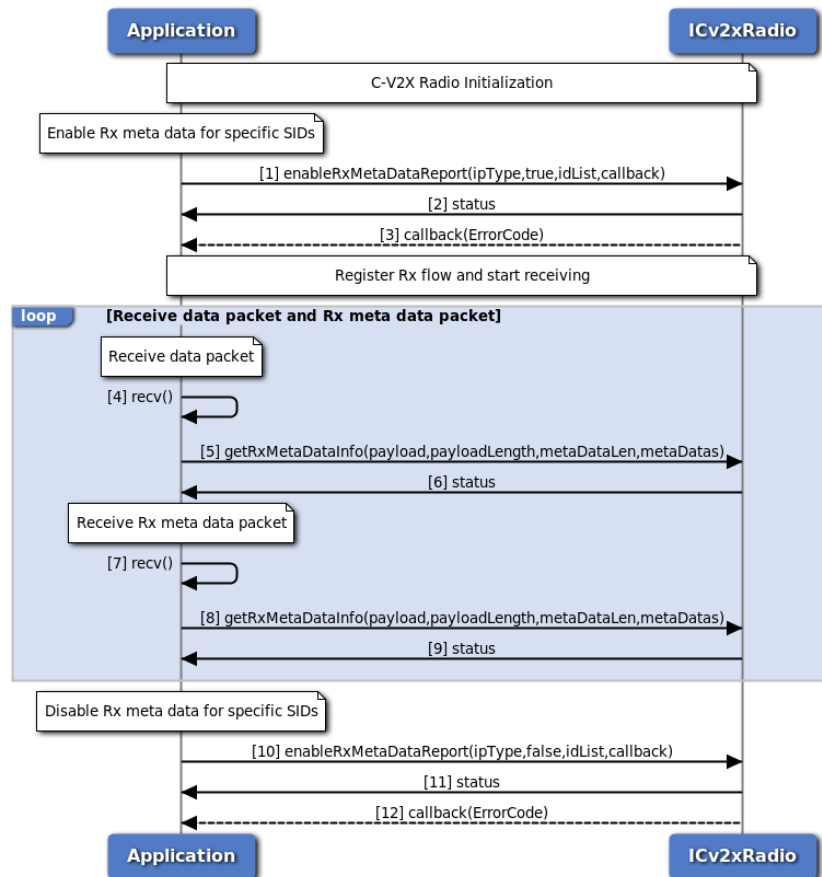

**Figure 3-88 C-V2X TX Status Report Call Flow - C Version**

This call flow diagram describes the sequence of steps for getting C-V2X Tx Status report per transport block using C version APIs. Application must perform C-V2X radio initialization before calling any methods of C-V2X radio.

1. Application requests to register a listener for Tx status report, providing the interested port number(portA) of Tx status reports and the listener for receiving the reports. C-V2X radio enables Tx status report in low layer if it is the first request for registering Tx status report.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was performed successfully.
3. Tx status report is generated for each transport block transmitted, the portB included in Tx status report indicates which source port the specific transport block is sent from, it can be used to associate the Tx status report with a Tx SPS/Event flow. C-V2X radio filters received Tx status reports based on the port of the listener (portA) and the port included in Tx status report (portB):
  - If portA is 0, no filtering to the Tx status reports, application gets Tx status reports for all transport blocks.

- If portA is not 0 and it equals to portB, application only gets Tx status reports for transport blocks being sent from the specified port.
  - In other cases, Tx status reports are not sent to application.
4. Application deregister listener for Tx status report. If it is the last listener for Tx status report in the system, C-V2X radio disables Tx status report in low layer.
  5. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was performed successfully.

### 3.6.13 C-V2X RX Meta Data

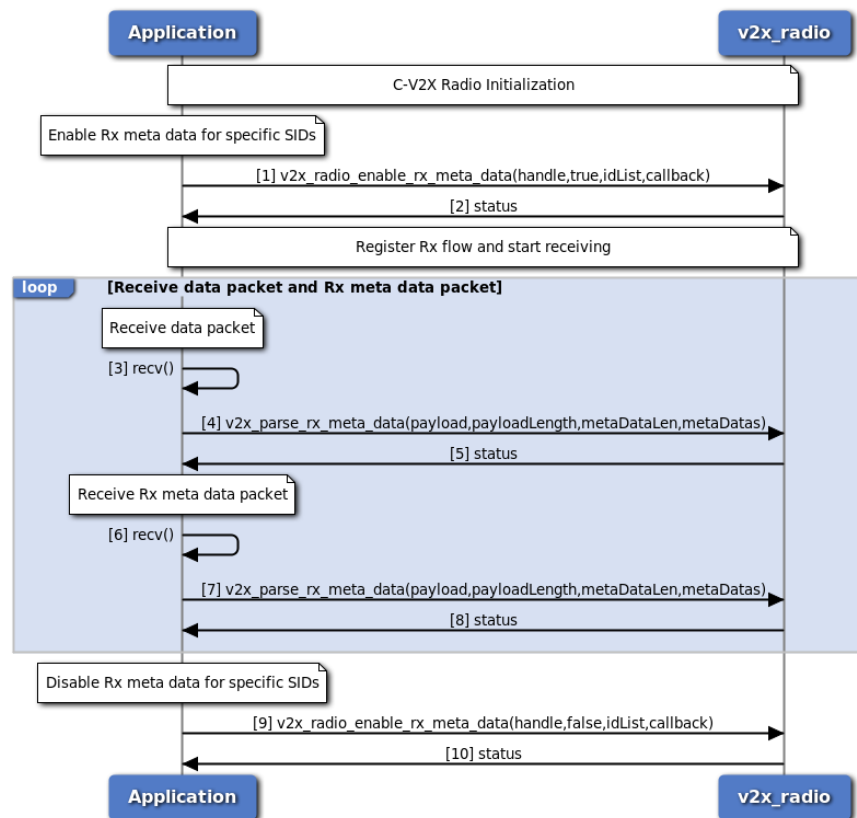

**Figure 3-89 C-V2X RX Meta Data Call Flow - C++ Version**

This call flow diagram describes the sequence of steps for enabling C-V2X Rx meta data per packet for non-IP traffic using C++ version APIs. Application must perform C-V2X radio initialization before calling any methods of ICv2xRadio.

1. Application requests to enable Rx meta data, providing the traffic type (only Non-IP is supported for Rx meta data), the interested service IDs and the callback function that used for notification of the result.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
3. C-V2X radio sends asynchronous notification via the callback function indication the status of the

request.

4. After the enable of Rx meta data, application receives data packet which includes raw data along with SFN and subchannel index information via the Rx socket returned from Rx flow registration.
5. Application calls method `getRxMetaDataInfo` to get the raw data, SFN and subchannel index information from received data packet.
6. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the data packet was parsed successfully.
7. Application receives Rx meta data packet via the Rx socket returned from Rx flow registration, one Rx meta data packet may include Rx meta data for multiple received data packets.
8. Application calls method `getRxMetaDataInfo` to get Rx meta data information from received Rx meta data packet. The information of SFN and subchannel index included in Rx meta data can be used to associate the Rx meta data with the received data packet.
9. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the Rx meta data packet was parsed successfully.
10. Application requests to disable Rx meta data, providing the traffic type (only Non-IP is supported for Rx meta data), the registered service IDs and the callback function that used for notification of the result.
11. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was sent successfully.
12. C-V2X radio sends asynchronous notification via the callback function indication the status of the request.

**Figure 3-90 C-V2X RX Meta Data Call Flow - C Version**

This call flow diagram describes the sequence of steps for enabling C-V2X Rx meta data per packet for non-IP traffic using C version APIs. Application must perform C-V2X radio initialization before calling any methods of C-V2X radio.

1. Application requests to enable Rx meta data, providing the traffic type (only Non-IP is supported for Rx meta data) and the interested service IDs.
2. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was performed successfully.
3. After the enable of Rx meta data, application receives data packet which includes raw data along with SFN and subchannel index information via the Rx socket returned from Rx flow registration.
4. Application calls method `v2x_parse_rx_meta_data` to get the raw data, SFN and subchannel index information from received data packet.
5. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the data packet was parsed successfully.
6. Application receives Rx meta data packet via the Rx socket returned from Rx flow registration, one Rx meta data packet may include Rx meta data for multiple received data packets.
7. Application calls method `v2x_parse_rx_meta_data` to get Rx meta data information from received Rx meta data packet. The information of SFN and subchannel index included in Rx meta data can be used to associate the Rx meta data with the received data packet.
8. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the Rx meta data packet was parsed successfully.

9. Application requests to disable Rx meta data, providing the traffic type (only Non-IP is supported for Rx meta data), the registered service IDs and the callback function that used for notification of the result.
10. Application receives synchronous status (either SUCCESS or FAILED) indicating whether the request was performed successfully.

### 3.7 Audio

#### 3.7.1 Audio Manager API call flow

Figure 3-91 Audio Manager API call flow

1. Application requests Audio factory for an Audio Manager and passes callback pointer.
2. Audio factory return IAudioManager object to application.
3. Application can use IAudioManager::getServiceStatus to determine the state of sub system.
4. The application receives the ServiceStatus of sub system which indicates the state of service.
5. AudioManager notifies the application when the subsystem is ready through the callback mechanism.
6. On Readiness, Application requests supported device types using getDevices method.
7. Application receives synchronous Status which indicates if the getDevices request was sent successfully.
8. Application is notified of the Status of the getDevices request (either SUCCESS or FAILED) via the application-supplied callback, with array of supported device types.
9. Application requests supported stream types using getStreamTypes method.
10. Application receives synchronous Status which indicates if the getStreamTypes request was sent successfully.
11. Application is notified of the Status of the getStreamTypes request (either SUCCESS or FAILED) via the application-supplied callback, with array of supported stream types.
12. Application requests create audio stream using createStream method.
13. Application receives synchronous Status which indicates if the createStream request was sent successfully.
14. Application is notified of the Status of the createStream request (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface.
15. Application requests delete audio stream using deleteStream method.
16. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
17. Application is notified of the Status of the deleteStream request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.2 Audio Voice Call Start/Stop call flow

**Figure 3-92 Audio Voice Call Start/Stop call flow**

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests create audio voice stream using createStream method with streamType as VOICE\_CALL.
4. Application receives synchronous Status which indicates if the createStream request was sent successfully.
5. Application is notified of the Status of the createStream request (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioVoiceStream.
6. Application requests start audio stream using startAudio method on IAudioVoiceStream.

7. Application receives synchronous Status which indicates if the startAudio request was sent successfully.
8. Application is notified of the Status of the startAudio request (either SUCCESS or FAILED) via the application-supplied callback.
9. Application requests stop audio stream using stopAudio method on IAudioVoiceStream.
10. Application receives synchronous Status which indicates if the stopAudio request was sent successfully.
11. Application is notified of the Status of the stopAudio request (either SUCCESS or FAILED) via the application-supplied callback.
12. Application requests delete audio stream using deleteStream method.
13. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
14. Application is notified of the Status of the deleteStream request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.3 Audio Voice Call Device Switch call flow

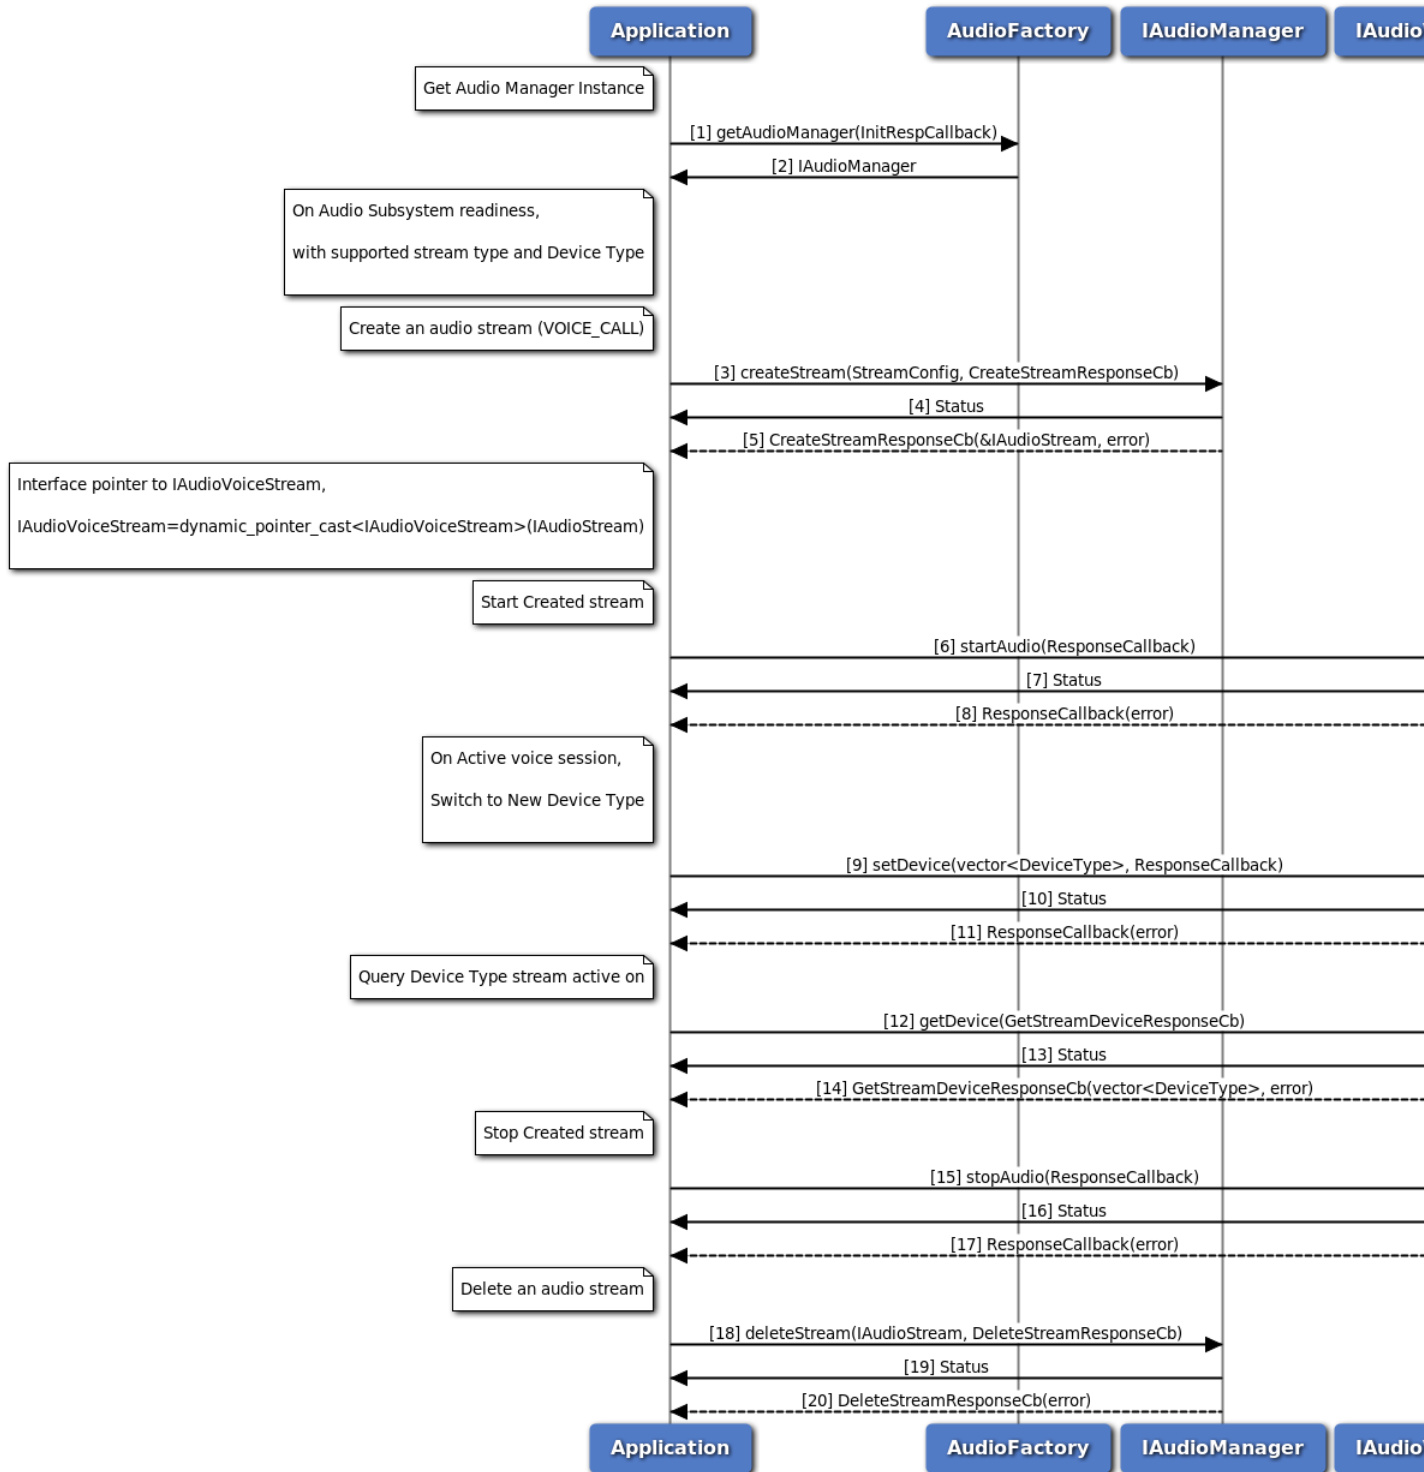

Figure 3-93 Audio Voice Call Device Switch call flow

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.

3. On Readiness, Application requests create audio voice stream using createStream method with streamType as VOICE\_CALL.
4. Application receives synchronous Status which indicates if the createStream request was sent successfully.
5. Application is notified of the Status of the createStream request (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioVoiceStream.
6. Application requests start audio stream using startAudio method on IAudioVoiceStream.
7. Application receives synchronous Status which indicates if the startAudio request was sent successfully.
8. Application is notified of the Status of the startAudio request (either SUCCESS or FAILED) via the application-supplied callback.
9. Application requests new device routing of stream using setDevice method on IAudioVoiceStream.
10. Application receives synchronous Status which indicates if the setDevice request was sent successfully.
11. Application is notified of the Status of the setDevice request (either SUCCESS or FAILED) via the application-supplied callback.
12. Application query device stream routed to using getDevice method on IAudioVoiceStream.
13. Application receives synchronous Status which indicates if the getDevice request was sent successfully.
14. Application is notified of the Status of the getDevice request (either SUCCESS or FAILED) via the application-supplied callback, along with device types.
15. Application requests stop audio stream using stopAudio method on IAudioVoiceStream.
16. Application receives synchronous Status which indicates if the stopAudio request was sent successfully.
17. Application is notified of the Status of the stopAudio request (either SUCCESS or FAILED) via the application-supplied callback.
18. Application requests delete audio stream using deleteStream method.
19. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
20. Application is notified of the Status of the deleteStream request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.4 Audio Voice Call Volume/Mute control call flow

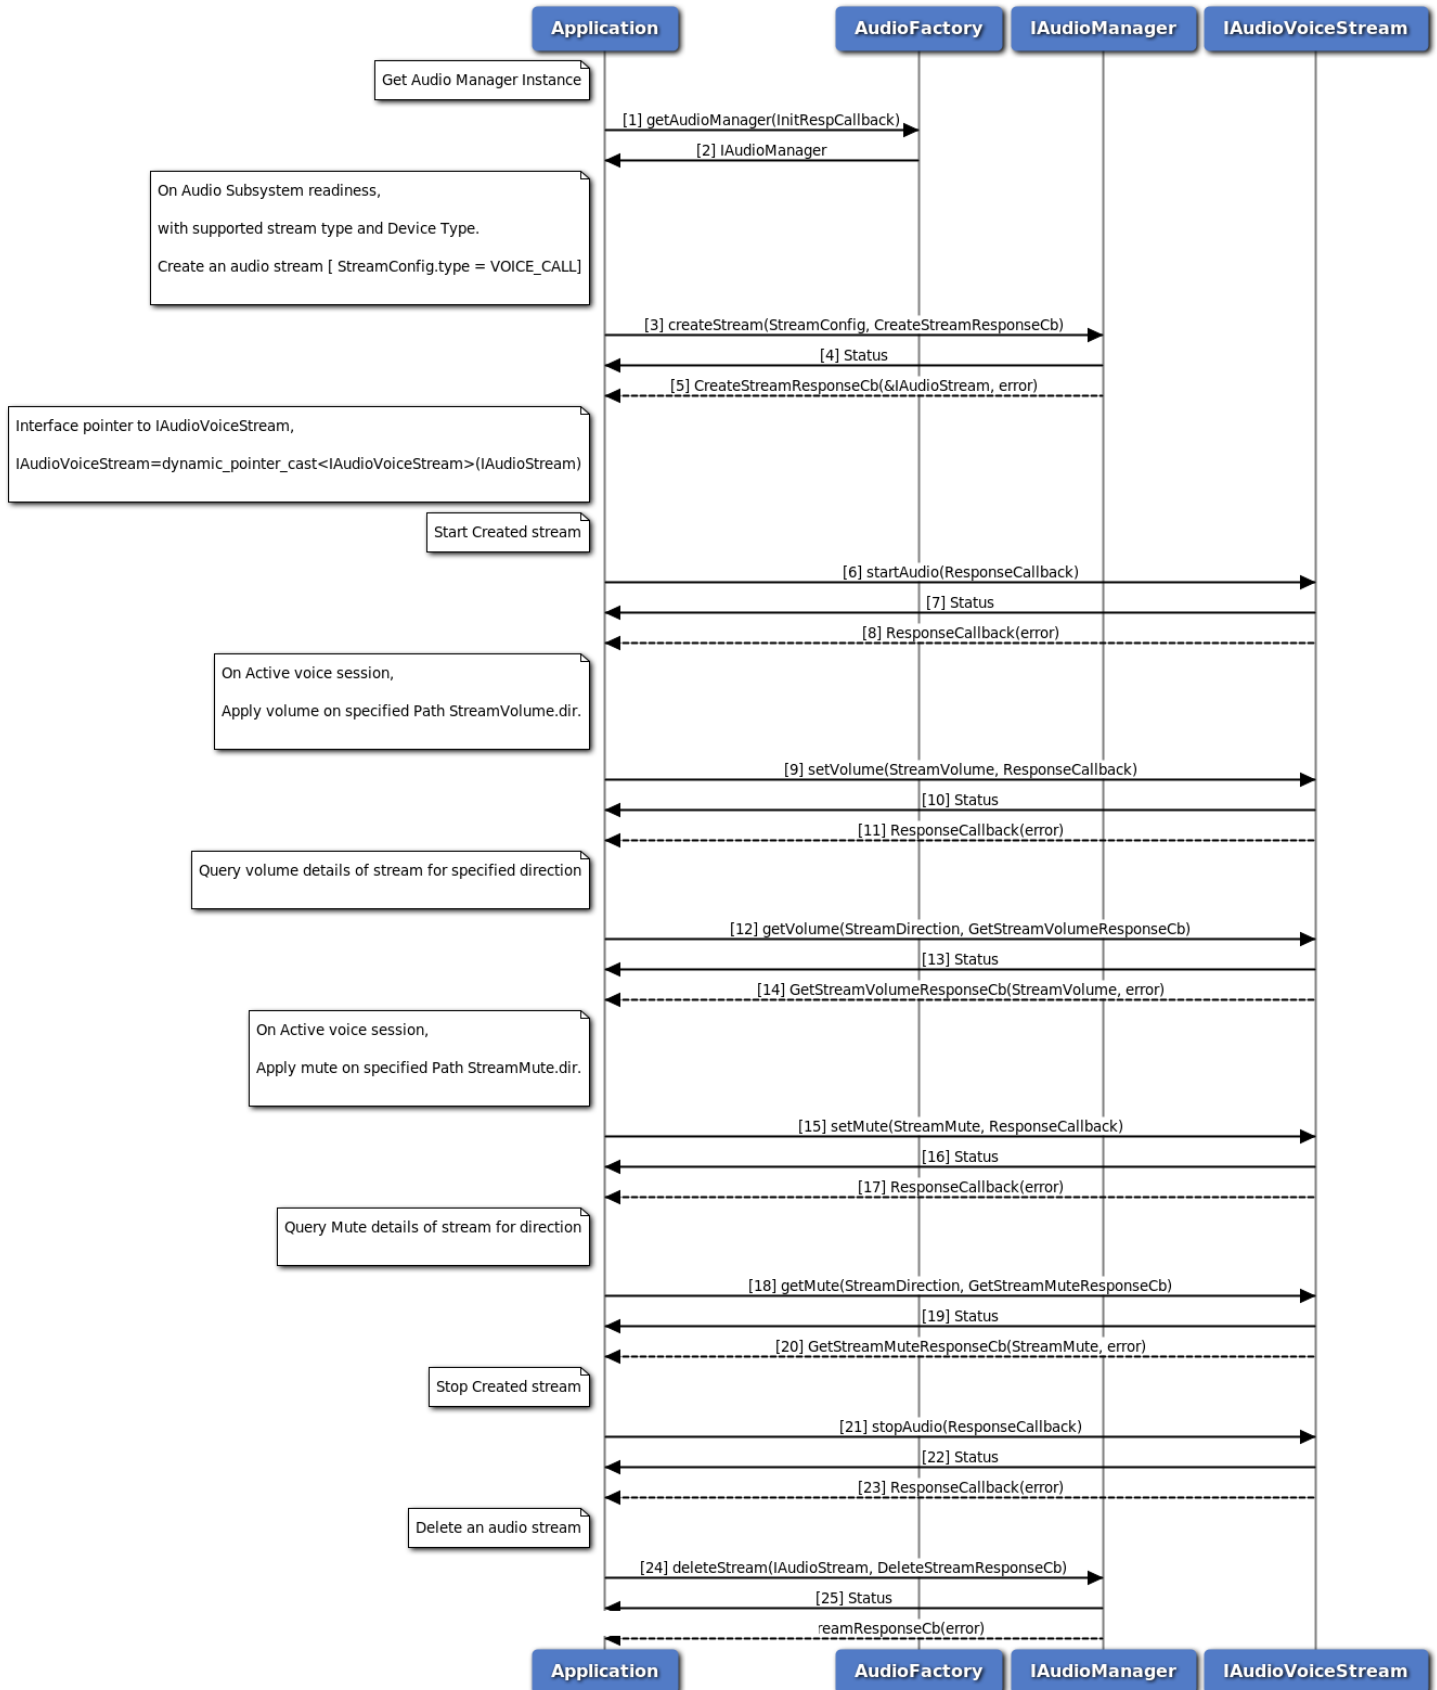

Figure 3-94 Audio Voice Call Volume/Mute control call flow

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests create audio voice stream using createStream method with streamType as VOICE\_CALL.
4. Application receives synchronous Status which indicates if the createStream request was sent successfully.
5. Application is notified of the Status of the createStream request (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioVoiceStream.
6. Application requests start audio stream using startAudio method on IAudioVoiceStream.
7. Application receives synchronous Status which indicates if the startAudio request was sent successfully.
8. Application is notified of the Status of the startAudio request (either SUCCESS or FAILED) via the application-supplied callback.
9. Application requests new volume on stream using setVolume method on IAudioVoiceStream for specified direction.
10. Application receives synchronous Status which indicates if the setVolume request was sent successfully.
11. Application is notified of the Status of the setVolume request (either SUCCESS or FAILED) via the application-supplied callback.
12. Application query volume on stream using getVolume method on IAudioVoiceStream for specified direction.
13. Application receives synchronous Status which indicates if the getVolume request was sent successfully.
14. Application is notified of the Status of the getVolume request (either SUCCESS or FAILED) via the application-supplied callback for specified direction with volume details.
15. Application requests new mute on stream using setMute method on IAudioVoiceStream for specified direction.
16. Application receives synchronous Status which indicates if the setMute request was sent successfully.
17. Application is notified of the Status of the setMute request (either SUCCESS or FAILED) via the application-supplied callback.
18. Application query mute details on stream using getMute method on IAudioVoiceStream for specified direction.
19. Application receives synchronous Status which indicates if the getMute request was sent successfully.
20. Application is notified of the Status of the getMute request (either SUCCESS or FAILED) via the application-supplied callback for specified direction with mute details.
21. Application requests stop audio stream using stopAudio method on IAudioVoiceStream.
22. Application receives synchronous Status which indicates if the stopAudio request was sent successfully.
23. Application is notified of the Status of the stopAudio request (either SUCCESS or FAILED) via the application-supplied callback.

24. Application requests delete audio stream using deleteStream method.
25. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
26. Application is notified of the Status of the deleteStream request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.5 Call flow to play DTMF tone

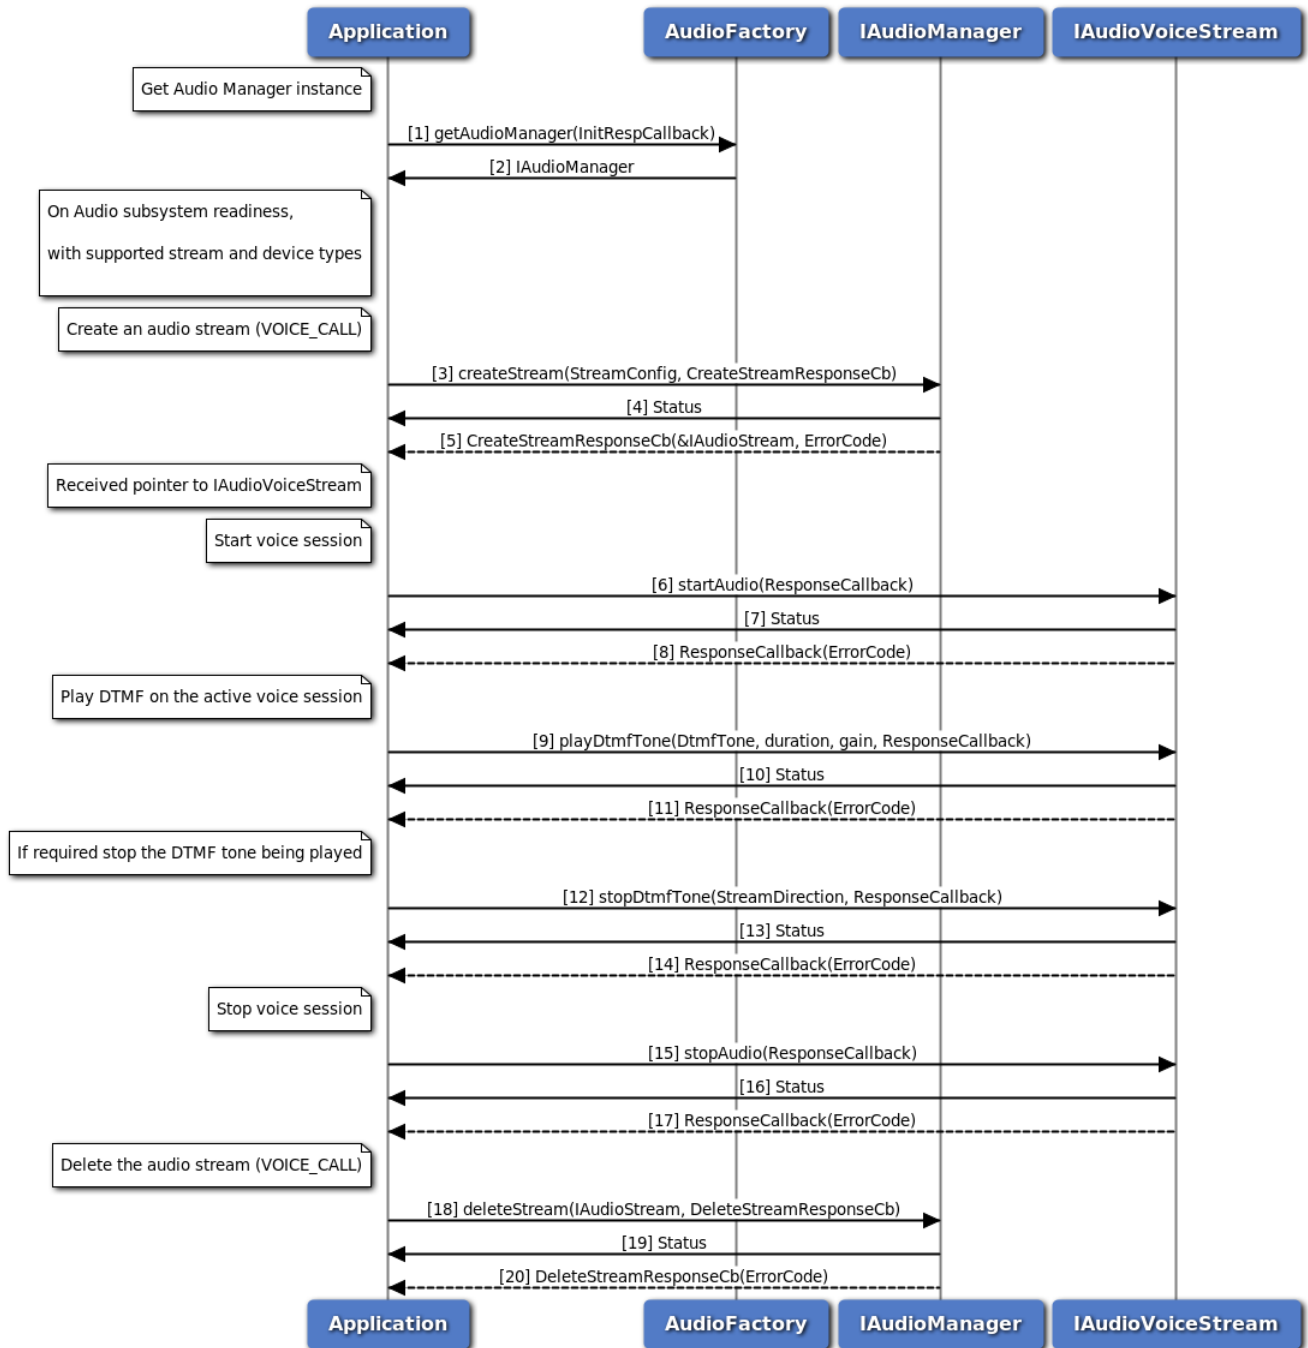

Figure 3-95 Call flow to play DTMF tone

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to create a voice stream with streamType as VOICE\_CALL.

4. Application receives synchronous status which indicates if the createStream request was sent successfully.
5. Application is notified of the createStream request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioVoiceStream.
6. Application requests to start voice session using startAudio method on IAudioVoiceStream.
7. Application receives synchronous status which indicates if the startAudio request was sent successfully.
8. Application is notified of the startAudio request status (either SUCCESS or FAILED) via the application-supplied callback.
9. Application requests to play a DTMF tone associated with the voice session
10. Application receives synchronous status which indicates if the playDtmfTone request was sent successfully.
11. Application is notified of the playDtmfTone request status (either SUCCESS or FAILED) via the application-supplied callback.
12. Application can optionally stop the DTMF tone being played, before its duration expires.
13. Application receives synchronous status which indicates if the stopDtmfTone request was sent successfully.
14. Application is notified of the stopDtmfTone request status (either SUCCESS or FAILED) via the application-supplied callback.
15. Application requests to stop the voice session using stopAudio method on IAudioVoiceStream.
16. Application receives synchronous Status which indicates if the stopAudio request was sent successfully.
17. Application is notified of the stopAudio request status(either SUCCESS or FAILED) via the application-supplied callback.
18. Application requests delete audio stream using deleteStream method.
19. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
20. Application is notified of the deleteStream request status(either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.6 Call flow to detect DTMF tones

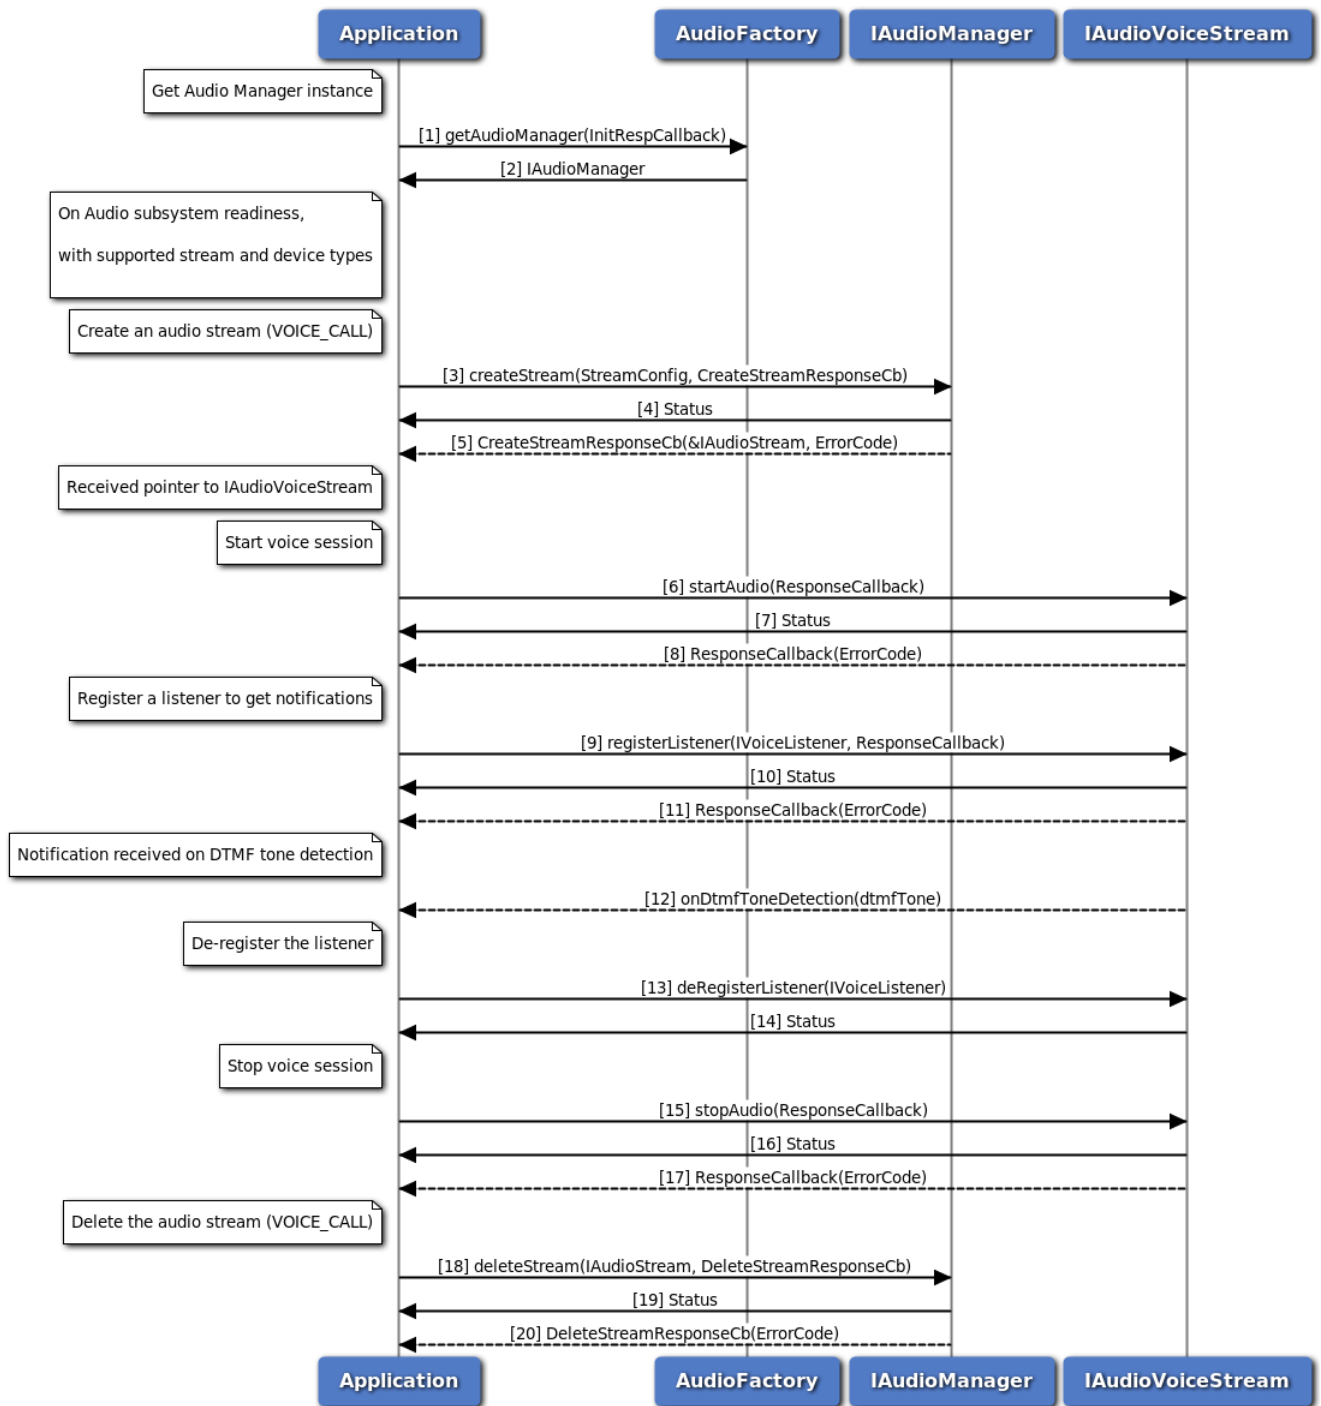

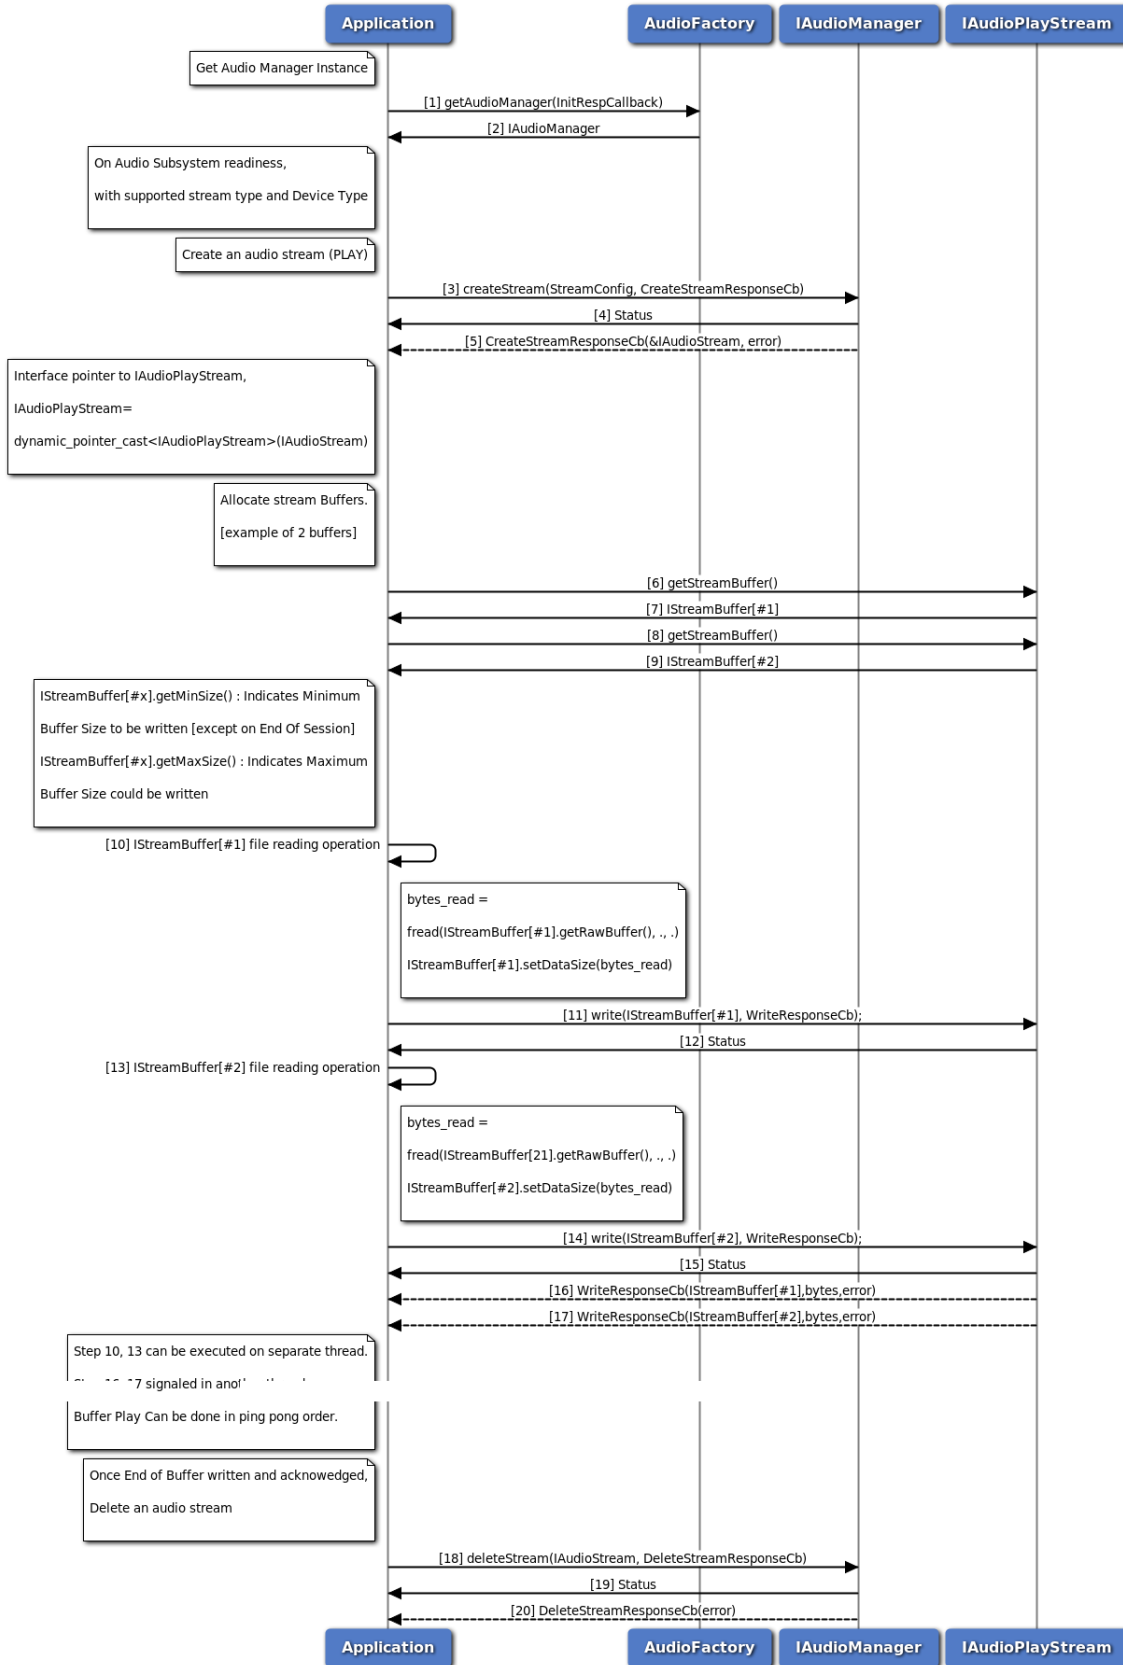

Figure 3-96 Call flow to detect DTMF tone

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.

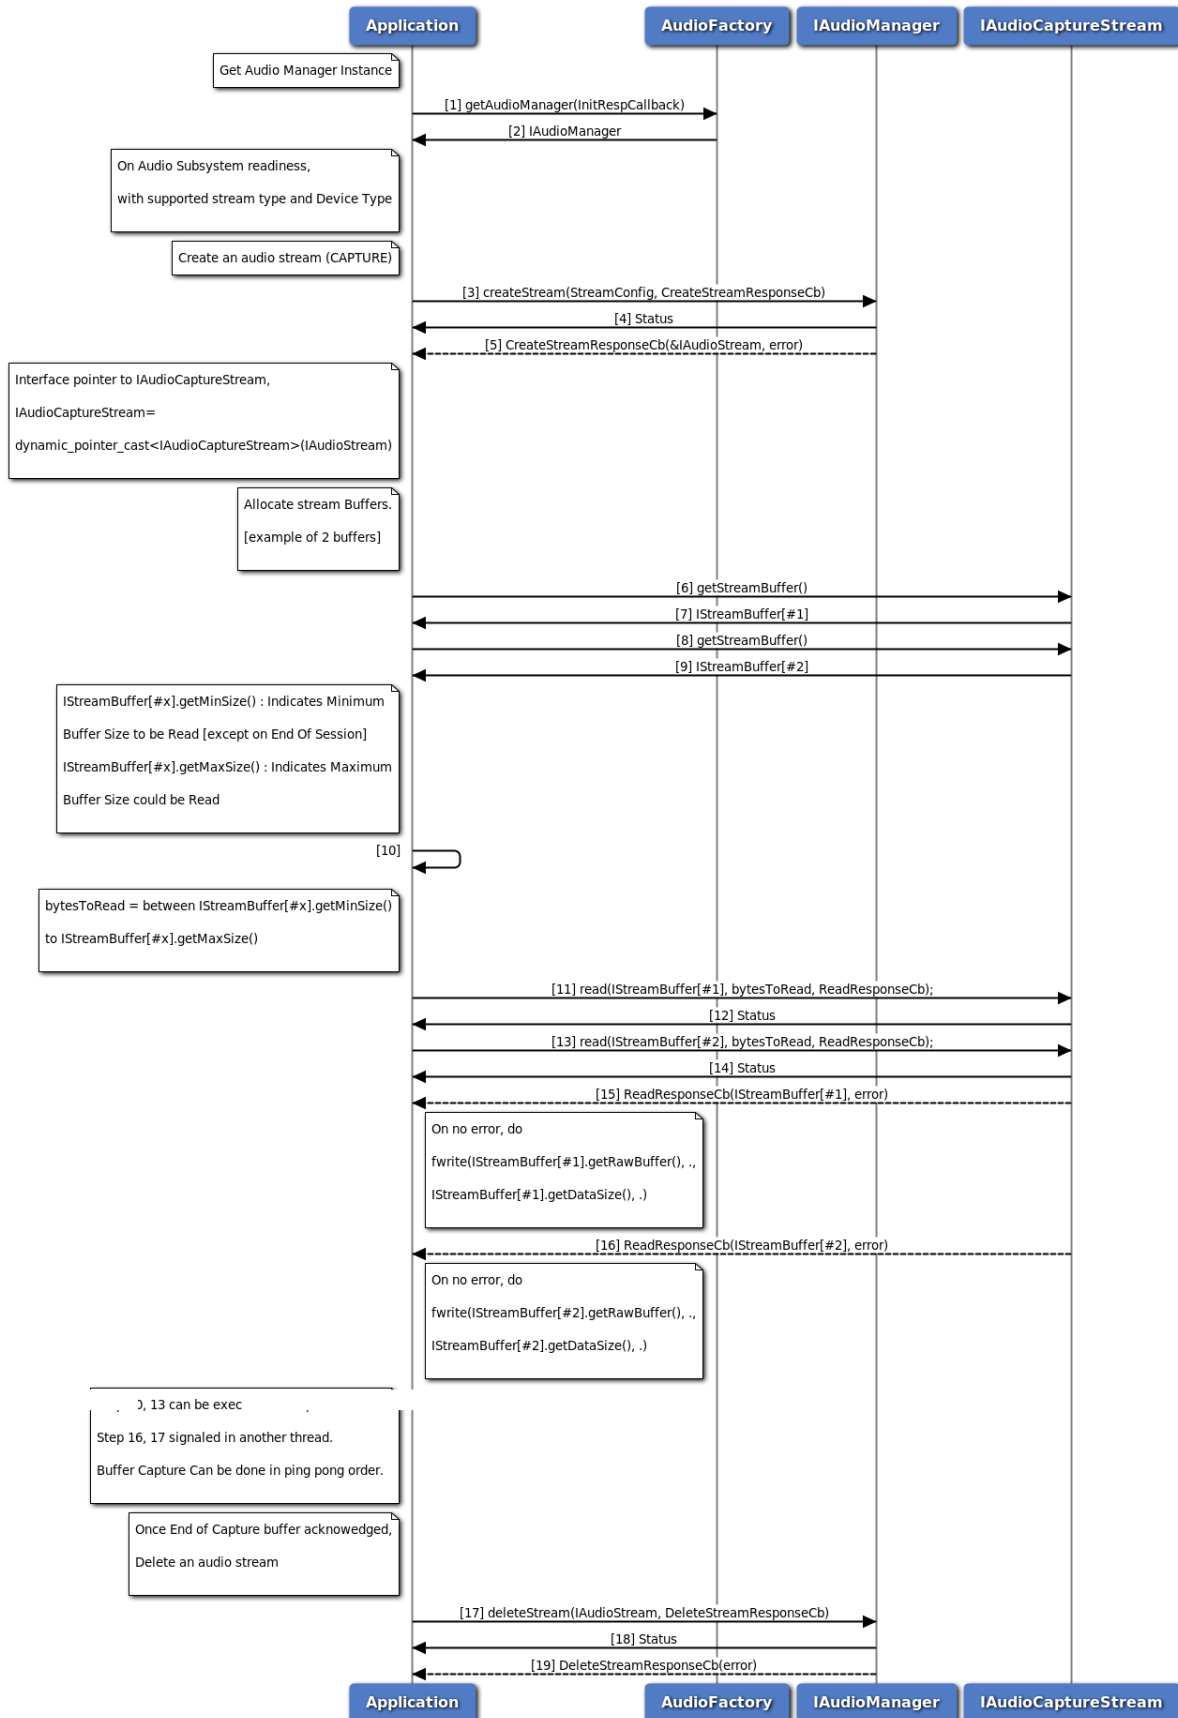

3. On Readiness, Application requests to create a voice stream with streamType as VOICE\_CALL.
4. Application receives synchronous status which indicates if the createStream request was sent successfully.
5. Application is notified of the createStream request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioVoiceStream.
6. Application requests to start voice session using startAudio method on IAudioVoiceStream.
7. Application receives synchronous status which indicates if the startAudio request was sent successfully.
8. Application is notified of the startAudio request status (either SUCCESS or FAILED) via the application-supplied callback.
9. Application registers a listener for getting notifications when DTMF tones are detected
10. Application receives synchronous status which indicates if the registerListener request was sent successfully.
11. Application is notified of the registerListener request status (either SUCCESS or FAILED) via the application-supplied callback.
12. Application receives onDtmfToneDetection notification when a DTMF tone is detected in the active voice call session
13. Application deregisters a listener to stop getting notifications
14. Application receives synchronous status which indicates if the deRegisterListener request was sent successfully.
15. Application requests to stop the voice session using stopAudio method on IAudioVoiceStream.
16. Application receives synchronous Status which indicates if the stopAudio request was sent successfully.
17. Application is notified of the stopAudio request status(either SUCCESS or FAILED) via the application-supplied callback.
18. Application requests delete audio stream using deleteStream method.
19. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
20. Application is notified of the deleteStream request status(either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.7 Audio Playback call flow

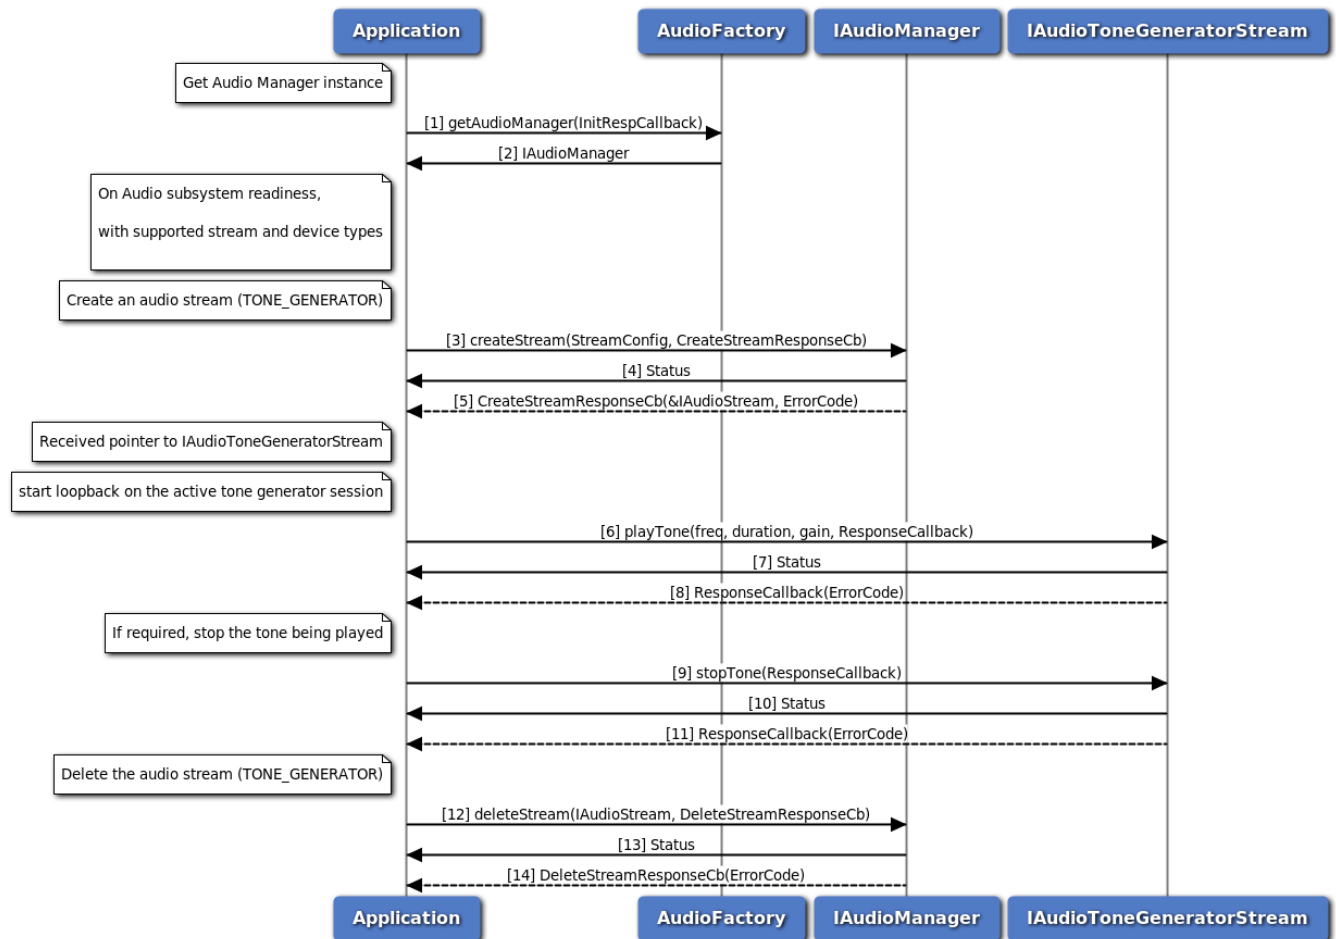

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests create audio playback stream using createStream method with streamType as PLAY.
4. Application receives synchronous Status which indicates if the createStream request was sent successfully.
5. Application is notified of the Status of the createStream request (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioPlayStream.
6. Application requests stream buffer#1 using getStreamBuffer method on IAudioPlayStream.
7. Application receives IStreamBuffer if Success.
8. Application requests stream buffer#2 using getStreamBuffer method on IAudioPlayStream.
9. Application receives IStreamBuffer if Success.
10. Application writes audio samples on buffer#1 using getRawBuffer method on IStreamBuffer.
11. Application writes buffer#1 on Playback session using write method on IAudioPlayStream.
12. Application receives synchronous Status which indicates if the write request was sent successfully.
13. Application writes audio samples on buffer#2 using getRawBuffer method on IStreamBuffer.
14. Application writes buffer#2 on Playback session using write method on IAudioPlayStream.
15. Application receives synchronous Status which indicates if the write request was sent successfully.
16. Application is notified of the buffer#1 write Status (either SUCCESS or FAILED) via the application-supplied write callback with successful bytes written.
17. Application is notified of the buffer#2 write Status (either SUCCESS or FAILED) via the application-supplied write callback with successful bytes written.
18. Application requests delete audio stream using deleteStream method.
19. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
20. Application is notified of the Status of the deleteStream request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.8 Audio Capture call flow

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests create audio capture stream using createStream method with streamType as CAPTURE.
4. Application receives synchronous Status which indicates if the createStream request was sent successfully.
5. Application is notified of the Status of the createStream request (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioCaptureStream.
6. Application requests stream buffer#1 using getStreamBuffer method on IAudioCaptureStream.
7. Application receives IStreamBuffer if Success.
8. Application requests stream buffer#2 using getStreamBuffer method on IAudioCaptureStream.
9. Application receives IStreamBuffer if Success.
10. Application decides read sample size.
11. Application issue read audio samples on buffer#1 using read method on IAudioCaptureStream.
12. Application receives synchronous Status which indicates if the read request was sent successfully.
13. Application issue read audio samples on buffer#2 using read method on IAudioCaptureStream.
14. Application receives synchronous Status which indicates if the read request was sent successfully.
15. Application is notified of the buffer#1 write Status (either SUCCESS or FAILED) via the application-supplied read callback with successful bytes read.
16. Application is notified of the buffer#2 write Status (either SUCCESS or FAILED) via the application-supplied read callback with successful bytes read.
17. Application requests delete audio stream using deleteStream method.
18. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
19. Application is notified of the Status of the deleteStream request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.9 Audio Tone Generator call flow

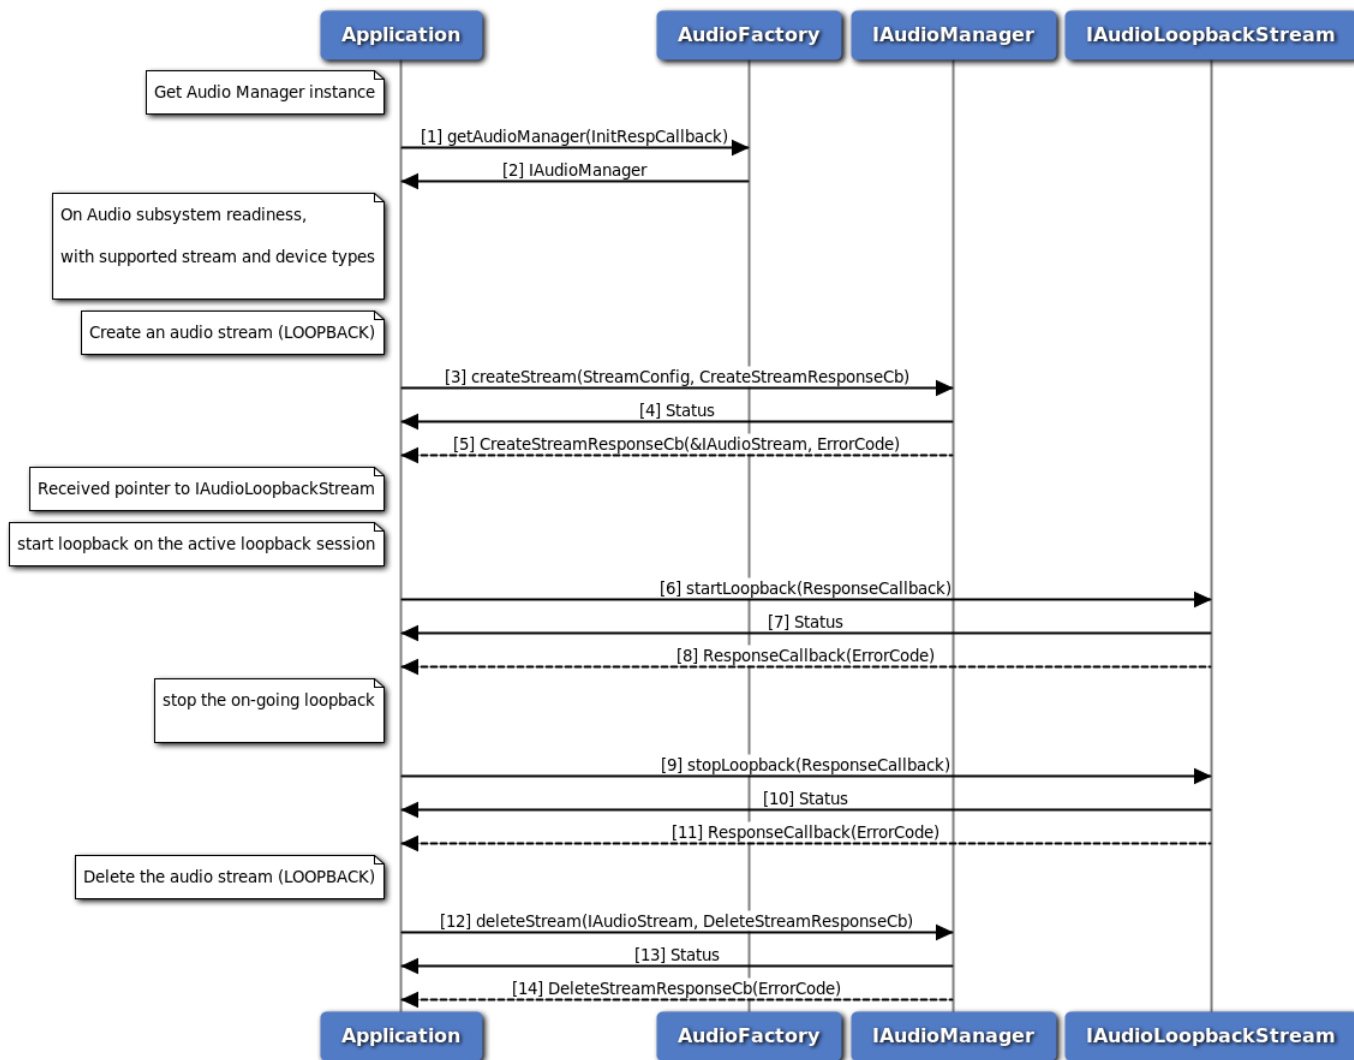

**Figure 3-99 Call flow to play/stop tone on a sink device**

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to create a tone generator stream with streamType as TONE\_GENERATOR.
4. Application receives synchronous status which indicates if the createStream request was sent successfully.
5. Application is notified of the createStream request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioToneGeneratorStream.
6. Application requests to play tone using playTone method on IAudioToneGeneratorStream.

7. Application receives synchronous status which indicates if the playTone request was sent successfully.
8. Application is notified of the playTone request status (either SUCCESS or FAILED) via the application-supplied callback.
9. Application can optionally stop the tone being played, before its duration expires.
10. Application receives synchronous status which indicates if the stopTone request was sent successfully.
11. Application is notified of the stopTone request status (either SUCCESS or FAILED) via the application-supplied callback.
12. Application requests delete audio stream using deleteStream method.
13. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
14. Application is notified of the deleteStream request status(either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.10 Audio Loopback call flow

**Figure 3-100 Call flow to start/stop loopback between source and sink devices**

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to create a loopback stream with streamType as LOOPBACK.
4. Application receives synchronous status which indicates if the createStream request was sent successfully.
5. Application is notified of the createStream request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioLoopbackStream.
6. Application requests to start loopback using startLoopback method on IAudioLoopbackStream.
7. Application receives synchronous status which indicates if the startLoopback request was sent successfully.

8. Application is notified of the startLoopback request status (either SUCCESS or FAILED) via the application-supplied callback.
9. Application requests to stop loopback using stopLoopback method on IAudioLoopbackStream.
10. Application receives synchronous status which indicates if the stopLoopback request was sent successfully.
11. Application is notified of the stopLoopback request status (either SUCCESS or FAILED) via the application-supplied callback.
12. Application requests delete audio stream using deleteStream method.
13. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
14. Application is notified of the deleteStream request status(either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.11 Compressed audio format playback call flow

Figure 3-101 Call flow to play Compressed audio format

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to create a play stream with streamType as PLAY.
4. Application receives synchronous status which indicates if the createStream request was sent successfully.
5. Application is notified of the createStream request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioPlayStream.
6. Application requests to write buffer using write method on IAudioPlayStream.
7. Application receives synchronous status which indicates if the write request was sent successfully.
8. Application is notified of the write request status (either SUCCESS or FAILED) via the application-supplied callback along with number of bytes written.
9. Application is notified of when pipeline is ready to accept new buffer if callback returns with error that number of bytes written are not equal to bytes requested.
10. Application send request to stop playback using stopAudio method of IAudioPlayStream.
11. Application receives synchronous status which indicates if the stopAudio request was sent successfully.
12. Application is notified of the stopAudio request status (either SUCCESS or FAILED) via the application-supplied callback.
13. Application is notified via indication that playback is stopped if StopType is STOP\_AFTER\_PLAY.
14. Application requests delete audio stream using deleteStream method.
15. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
16. Application is notified of the deleteStream request status(either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.12 Audio Transcoding Operation Callflow

Figure 3-102 Audio Transcoding Operation Callflow

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to create a transcoder.
4. Application receives synchronous status which indicates if the createTranscoder request was sent successfully.
5. Application is notified of the createTranscoder request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to transcoder interface referring to ITranscoder.
6. Application requests to read buffer using read method on ITranscoder.
7. Application receives synchronous status which indicates if the read request was sent successfully.
8. Application is notified of the read request status (either SUCCESS or FAILED) via the application-supplied callback along with isLastBuffer flag which indicates whether the buffer is last buffer to read or not.
9. Application requests to write buffer using write method on ITranscoder.
10. Application receives synchronous status which indicates if the write request was sent successfully. Application need to mark the isLastBuffer flag, whenever it is providing the last buffer to be write.
11. Application is notified of the write request status (either SUCCESS or FAILED) via the application-supplied callback along with number of bytes written.
12. Application is notified of when pipeline is ready to accept new buffer if callback returns with error that number of bytes written are not equal to bytes requested.
13. Once transcoding done, Application requests to tearDown transcoder as transcoder can not be used for multiple transcoding operations.
14. Application receives synchronous status which indicates if the tearDown request was sent successfully.
15. Application is notified of the tearDown request status (either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.13 Compressed audio format playback on Voice Paths Callflow

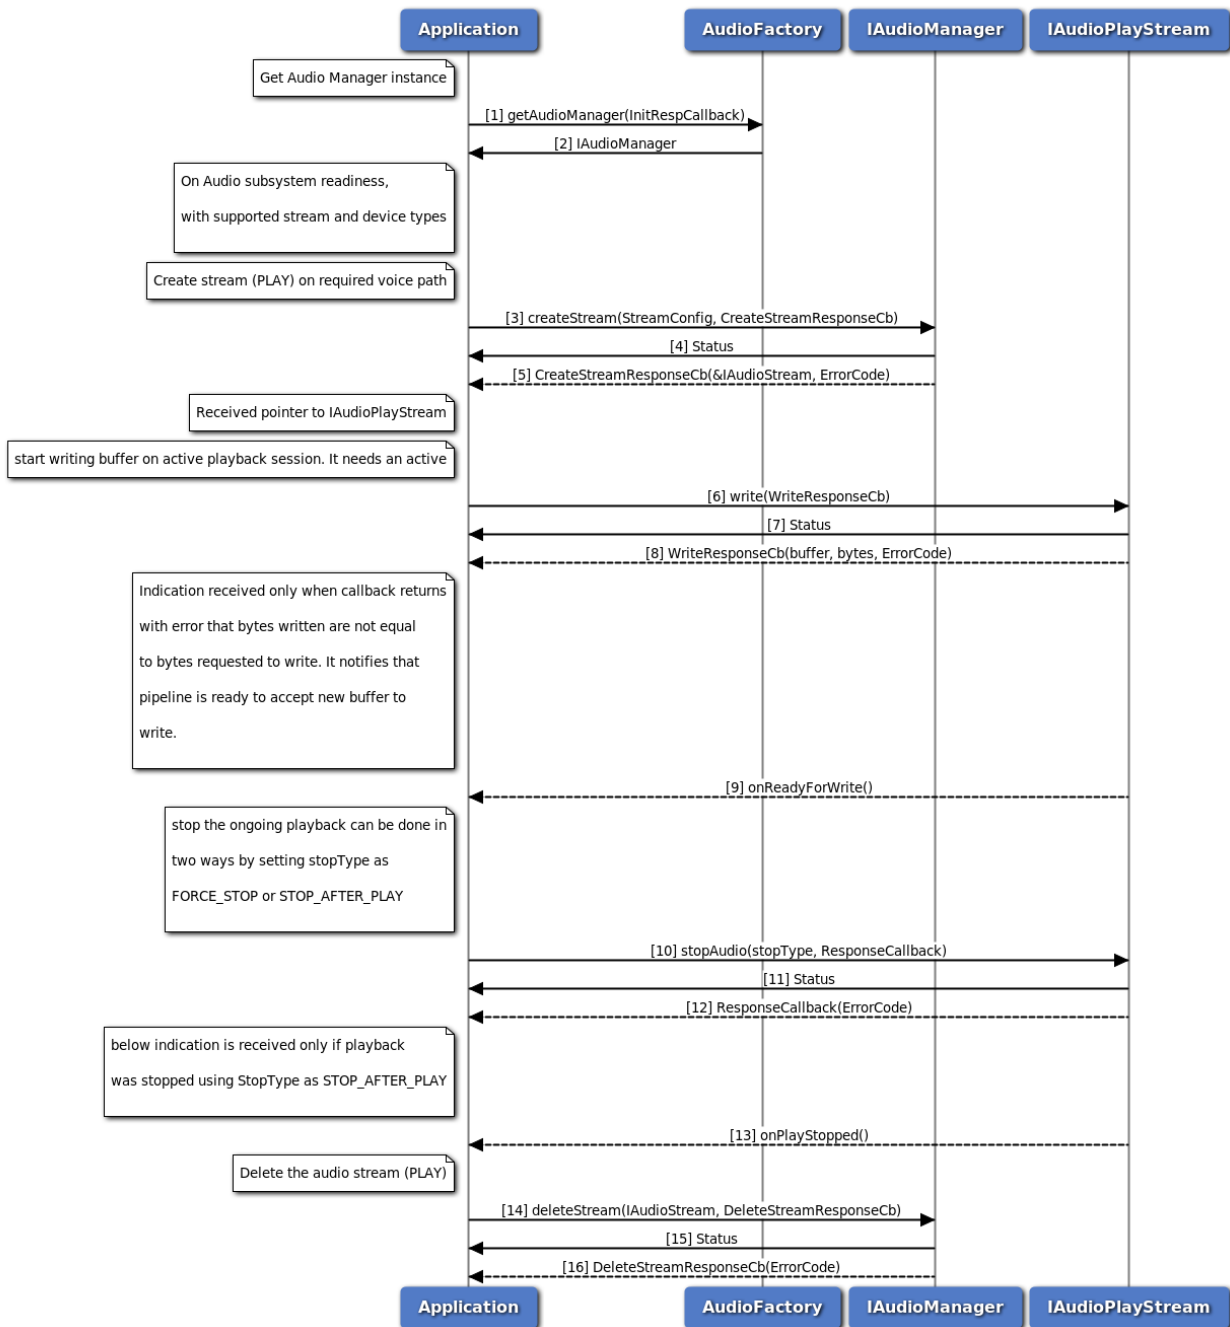

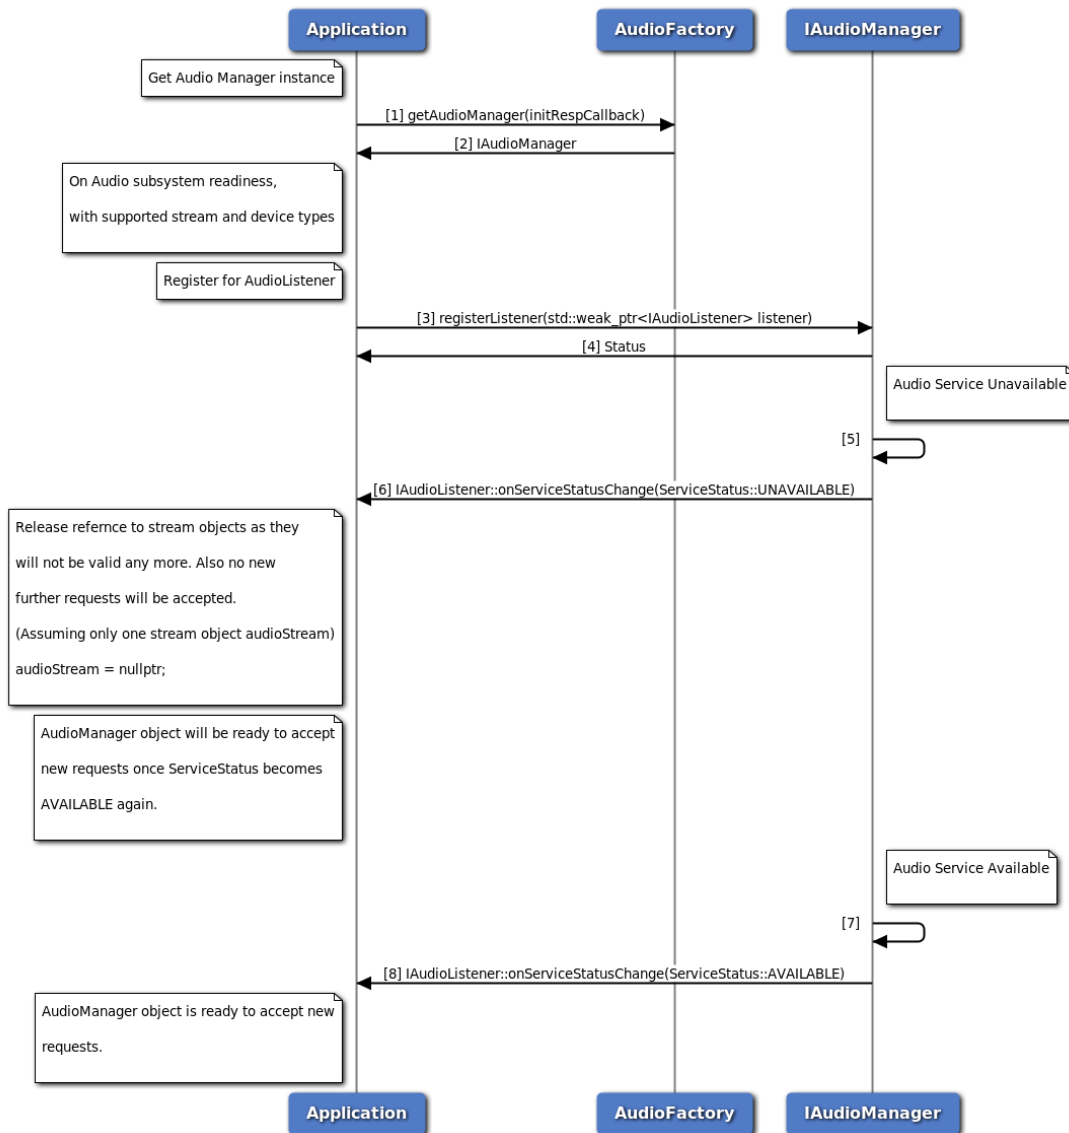

Figure 3-103 Compressed audio format playback on Voice Paths Callflow

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to create a play stream with streamType as PLAY, voicePaths direction as TX or RX and no device is selected.

4. Application receives synchronous status which indicates if the createStream request was sent successfully.
5. Application is notified of the createStream request status (either SUCCESS or FAILED) via the application-supplied callback, with pointer to stream interface referring to IAudioPlayStream.
6. Application requests to write buffer using write method on IAudioPlayStream. It needs an active voice session to play over voice paths, refer IAudioVoiceStream for more details on how to create voice stream.
7. Application receives synchronous status which indicates if the write request was sent successfully.
8. Application is notified of the write request status (either SUCCESS or FAILED) via the application-supplied callback along with number of bytes written.
9. Application is notified of when pipeline is ready to accept new buffer if callback returns with error that number of bytes written are not equal to bytes requested.
10. Application send request to stop playback using stopAudio method of IAudioPlayStream.
11. Application receives synchronous status which indicates if the stopAudio request was sent successfully.
12. Application is notified of the stopAudio request status (either SUCCESS or FAILED) via the application-supplied callback.
13. Application is notified via indication that playback is stopped if StopType is STOP\_AFTER\_PLAY.
14. Application requests delete audio play stream using deleteStream method.
15. Application receives synchronous Status which indicates if the deleteStream request was sent successfully.
16. Application is notified of the deleteStream request status(either SUCCESS or FAILED) via the application-supplied callback.

### 3.7.14 Audio Subsystem Restart Callflow

**Figure 3-104 Audio Subsystem Restart Callflow**

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On Readiness, Application requests to register listener to IAudioManager object.
4. Application receives synchronous status which indicates registerListener request was sent successfully.
5. IAudioManager is notified that audio service is unavailable.
6. Application receives a notification from the IAudioManager regarding service status as unavailable. Application is supposed to release references to all the IAudioStream/ITranscoder objects and related resources. Application should not send any new request to IAudioManager or

- IAudioStream/ITranscoder objects.
7. IAudioManager is notified that audio service is available.
  8. Application receives a notification from the IAudioManager regarding service status as available. IAudioManager object is now ready to accept new requests from application.

### 3.7.15 Audio calibration configuration status

**Figure 3-105 Audio calibration configuration status**

1. Application requests Audio factory for an Audio Manager.
2. Audio factory return IAudioManager object to application.
3. On sub system Readiness, application requests for calibration init status using getCalibrationInitStatus API to IAudioManager.
4. Application receives synchronous status which indicates if the getCalibrationInitStatus request was sent successfully.
5. Application is notified with CalibrationInitStatus and suitable error code via the application supplied callback.

### 3.8 Thermal manager call flow

Thermal manager provides APIs to get list of thermal zones and cooling devices. It also contains APIs to get a particular thermal zone and a particular cooling device details with the given Id.

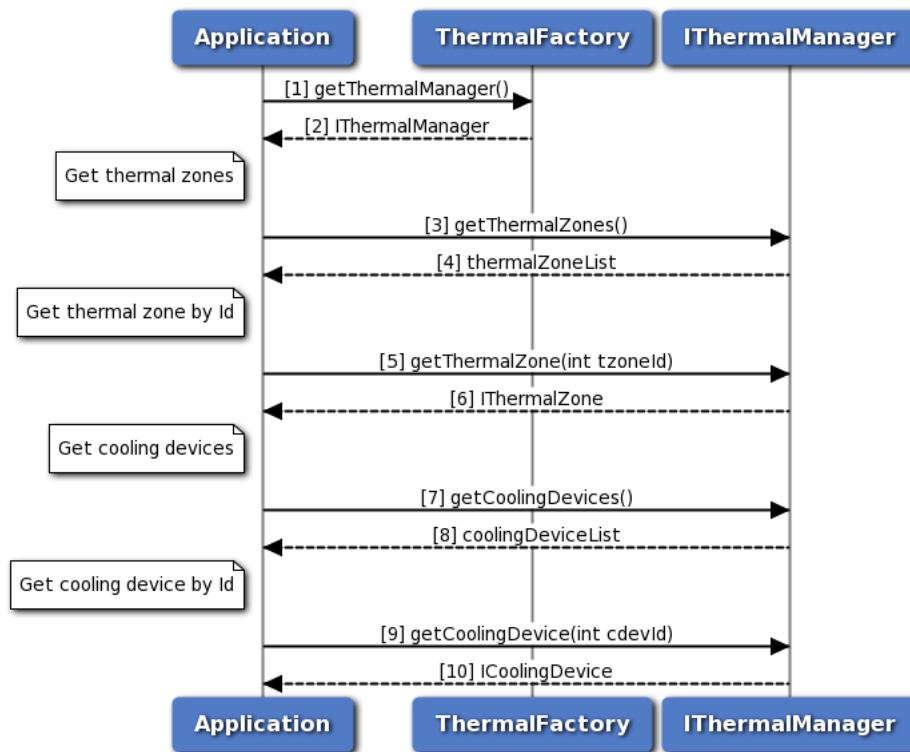

Figure 3-106 Thermal manager call flow

1. Application requests Thermal factory for Thermal Manager.
2. Thermal factory returns IThermalManager object to application.
3. Application sends request to get all thermal zones using IThermalManager object.
4. Thermal manager returns the list of thermal zones to the application.
5. Application requests for a particular thermal zone details by mentioning the thermal zone Id.
6. Application receives thermal zone details with the given Id from thermal manager.
7. Application sends request to get all cooling devices using IThermalManager object.
8. Thermal manager returns the list of cooling devices to the application.
9. Application requests for a particular cooling device details by passing the cooling device Id.
10. Thermal Manager sends cooling device details with the given Id to the application.

### 3.9 Thermal shutdown management

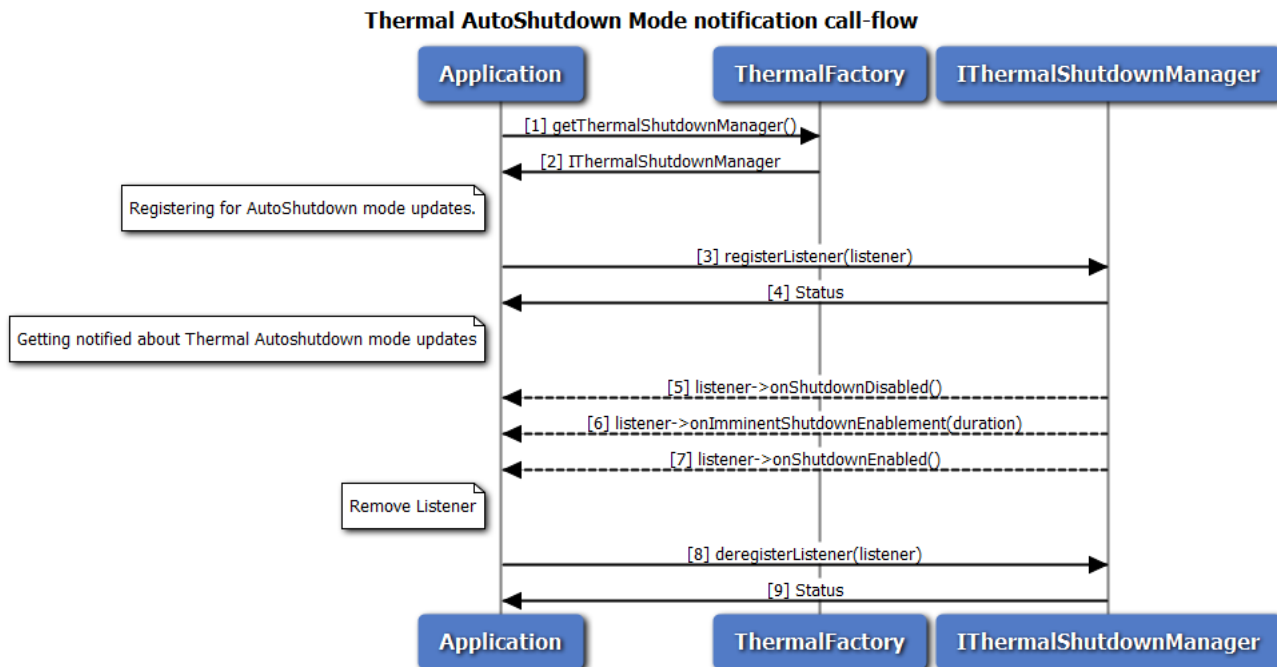

Thermal shutdown manager provides APIs to set/get auto thermal shutdown modes. It also has listener interface for notifications. Application will get the Thermal-shutdown manager object from thermal factory.

The application can register a listener for updates in thermal auto shutdown modes and its management service status. Also there is provision to set the desired thermal auto-shutdown mode.

When application is notified of service being unavailable, the thermal auto-shutdown mode updates are inactive. After service becomes available, the existing listener registrations will be maintained.

As a reference, auto-shutdown management in an eCall application is described in the below sections.

### 3.9.1 Call flow to register/remove listener for Thermal auto-shutdown mode updates.

**Figure 3-107 Call flow to register/remove listener for Thermal shutdown manager**

1. Application requests thermal factory for Thermal Shutdown Manager.
2. Thermal factory returns IThermalShutdownManager object using which application will register or remove a listener.
3. Application can register a listener for getting notifications on Thermal auto-shutdown mode updates.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application receives a notification that thermal auto-shutdown mode is disabled.
6. Application receives a notification that thermal auto-shutdown mode is going to be enabled soon. The exact duration is also received as part of notification.
7. Application receives a notification that thermal auto-shutdown mode is enabled.
8. Application can remove listener.
9. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

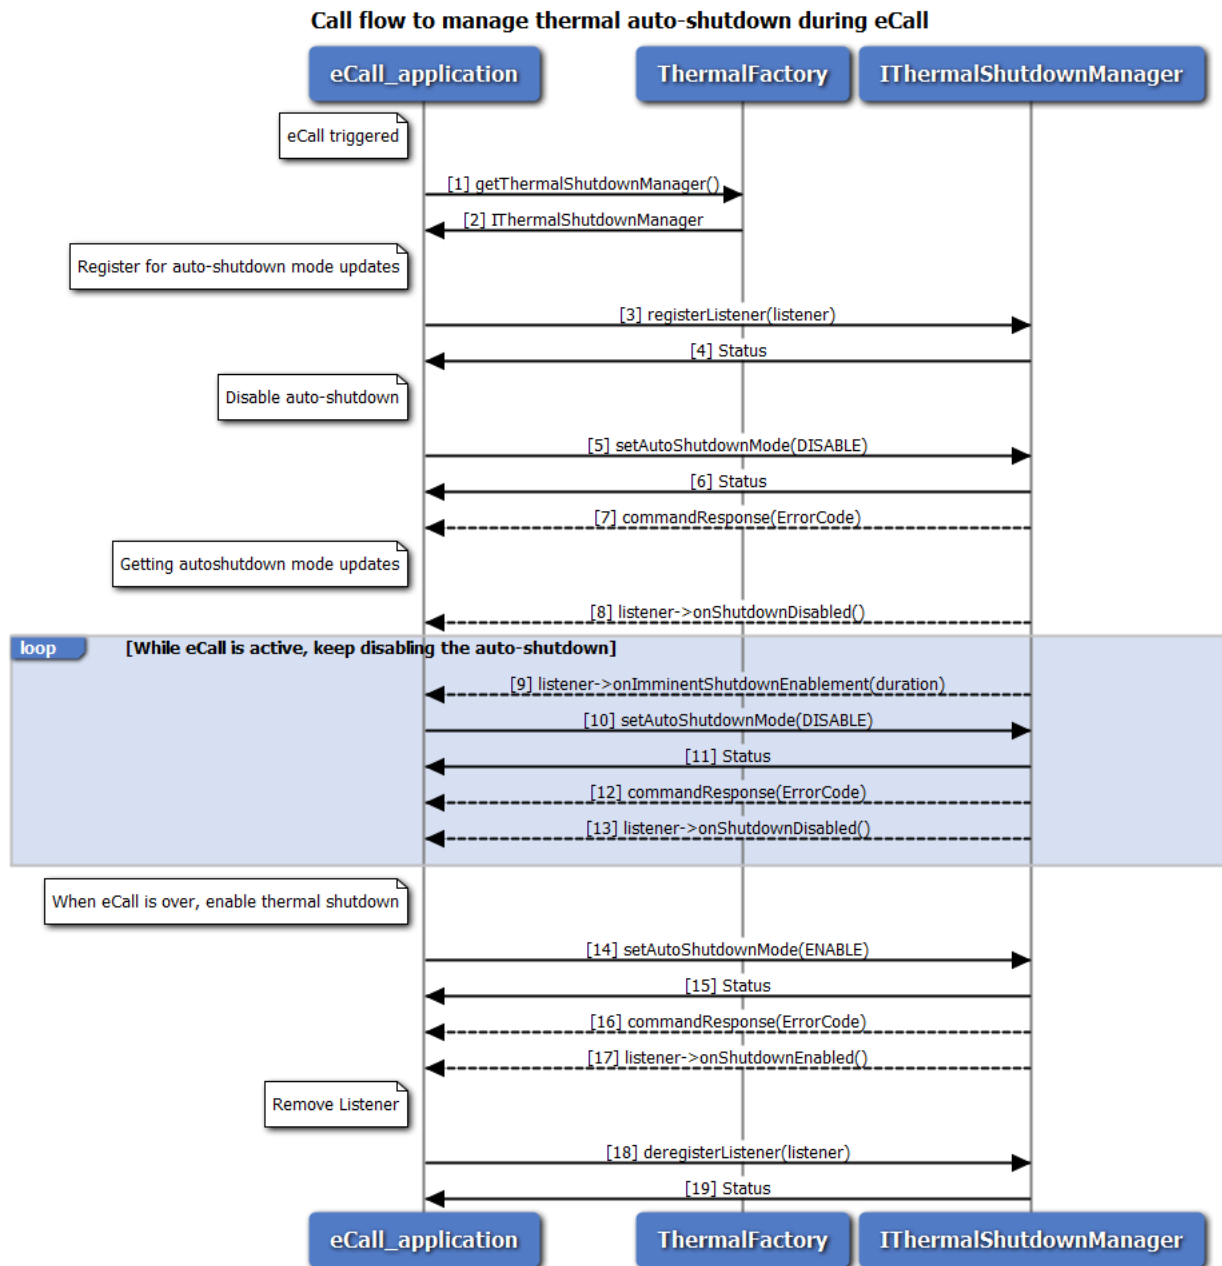

### 3.9.2 Call flow to set/get the Thermal auto-shutdown mode

**Figure 3-108 Call flow to set/get the Thermal auto-shutdown mode**

1. Application requests thermal factory for Thermal Shutdown Manager object using which application will set/get the thermal auto-shutdown mode.
2. Thermal factory returns IThermalShutdownManager object.
3. Application can query the thermal auto-shutdown mode.
4. Application receives synchronous status which indicates if the request was sent successfully.
5. Application receives the auto-shutdown mode asynchronously.
6. Application can set the thermal auto-shutdown mode to ENABLE or DISABLE.
7. Application receives synchronous status which indicates if the request was sent successfully.
8. Optionally, the response to setAutoShutdownMode request can be received by the application.

### 3.9.3 Call flow to manage thermal auto-shutdown from an eCall application.

**Figure 3-109 Call flow to manage thermal auto-shutdown from an eCall application**

1. When eCall is triggered, application requests thermal factory for Thermal Shutdown Manager.
2. Thermal factory returns IThermalShutdownManager object.
3. Application can register a listener for getting notifications on Thermal auto-shutdown mode updates.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application disables auto-shutdown using setAutoShutdownMode API, to prevent a possible thermal

- auto-shutdown during eCall.
6. Application receives synchronous status which indicates if the request was sent successfully.
  7. Optionally, the response to setAutoShutdownMode request can be received by the application.
  8. Application receives a notification that thermal auto-shutdown mode is disabled.
  9. Application receives an imminent auto-shutdown enable notification and system will attempt to enable auto-shutdown after a certain period. This notification is received if application does not enable auto-shutdown due to an active eCall.
  10. If the eCall is still active, the application disables auto-shutdown before it gets enabled automatically.
  11. Application receives synchronous status which indicates if the request was sent successfully.
  12. Optionally, the response to setAutoShutdownMode request can be received by the application.
  13. Application receives a notification that thermal auto-shutdown mode is disabled. Steps 9 to 13 are repeated as long as the eCall is active.
  14. When the eCall is completed, the application immediately enables auto-shutdown using setAutoShutdownMode API.
  15. Application receives synchronous status which indicates if the request was sent successfully.
  16. Optionally, the response to setAutoShutdownMode request can be received by the application.
  17. Application receives a notification that thermal auto-shutdown mode is enabled.
  18. Application can remove listener.
  19. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

## 3.10 TCU Activity Management

Application will get appropriate TCU-activity manager object from power factory. A Master/Slave client can register a listener for updates on TCU-activity state and its management service status. A Master client application can also set the system to a desired activity state. When the application is notified about the service being unavailable, the TCU-activity state notifications will be inactive. After the service becomes available, the existing listener registrations will be maintained.

The framework can work in ACTIVE or PASSIVE mode, based on the configuration of TCU-activity management service. In ACTIVE mode, the management service leads the system into desired activity state after receiving the acknowledgements from all the clients or after the configured timeout. However, in PASSIVE mode, the framework just notifies the clients about the state transition and conveys their acknowledgement status back to the Master application that triggered the transition.

### 3.10.1 Call flow to register/remove listener for TCU-activity manager

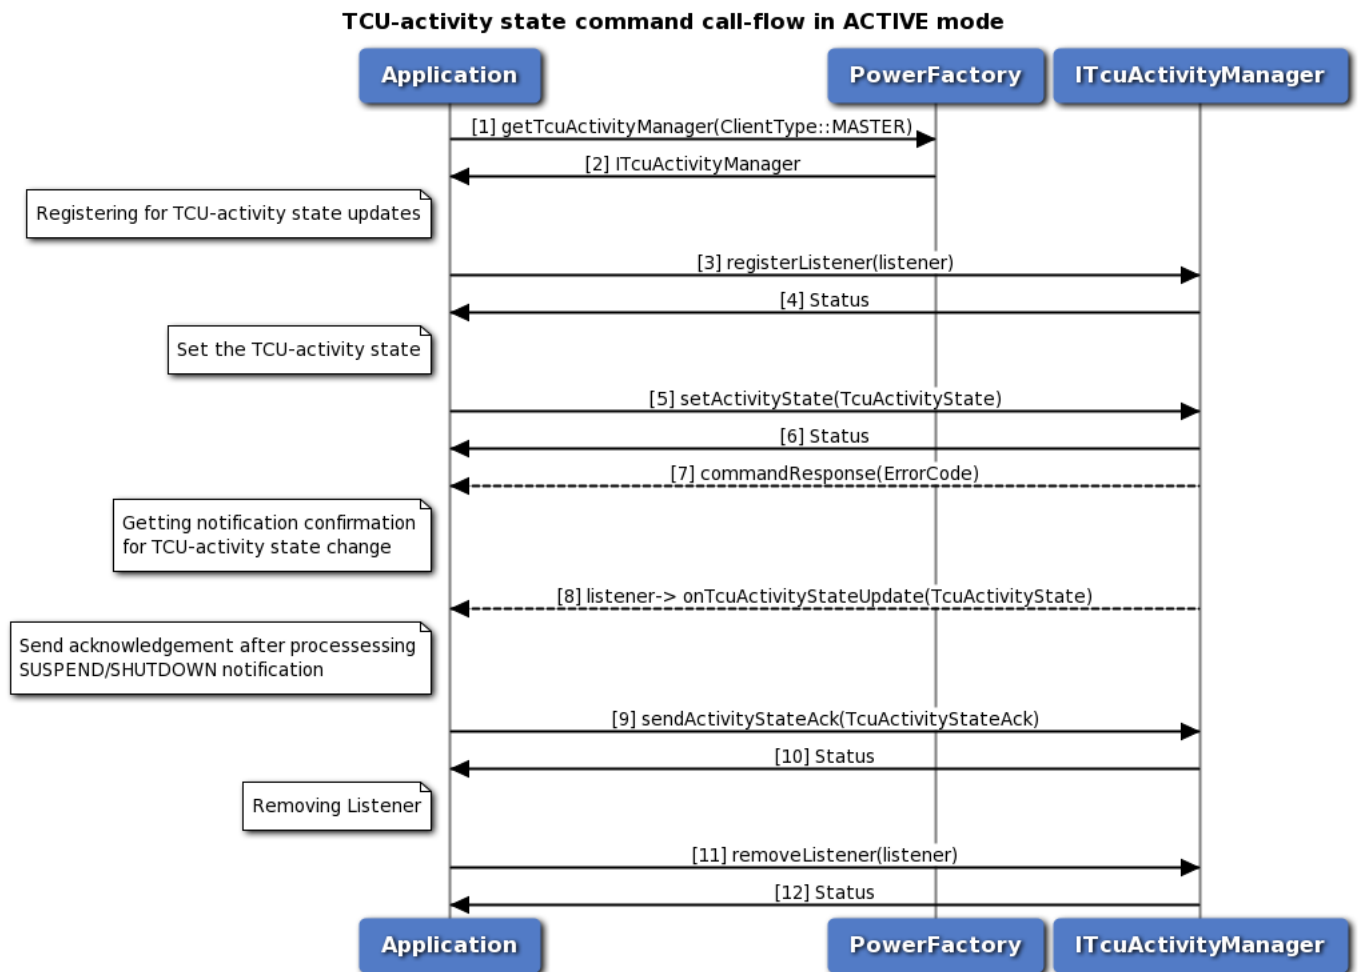

**Figure 3-110 Call flow to register/remove listener for TCU-activity manager**

1. Application requests power factory for TCU-activity manager object, with clientType as SLAVE.
2. Power factory returns ITcuActivityManager object using which application will register or remove a listener.
3. Application can register a listener for getting notifications on TCU-activity state updates.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application will get TCU-activity state notifications like SUSPEND, RESUME and SHUTDOWN.
6. Application will send one(despite multiple listeners) acknowledgement, after processing(save any required information) SUSPEND/SHUTDOWN notifications. This indicates the readiness of application for state-transition. However the TCU-activity management service doesn't wait for acknowledgement indefinitely, before performing the state transition.
7. Application receives synchronous status which indicates if the acknowledgement was sent successfully.
8. Application can remove listener.
9. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

### 3.10.2 Call flow to set the TCU-activity state in ACTIVE mode

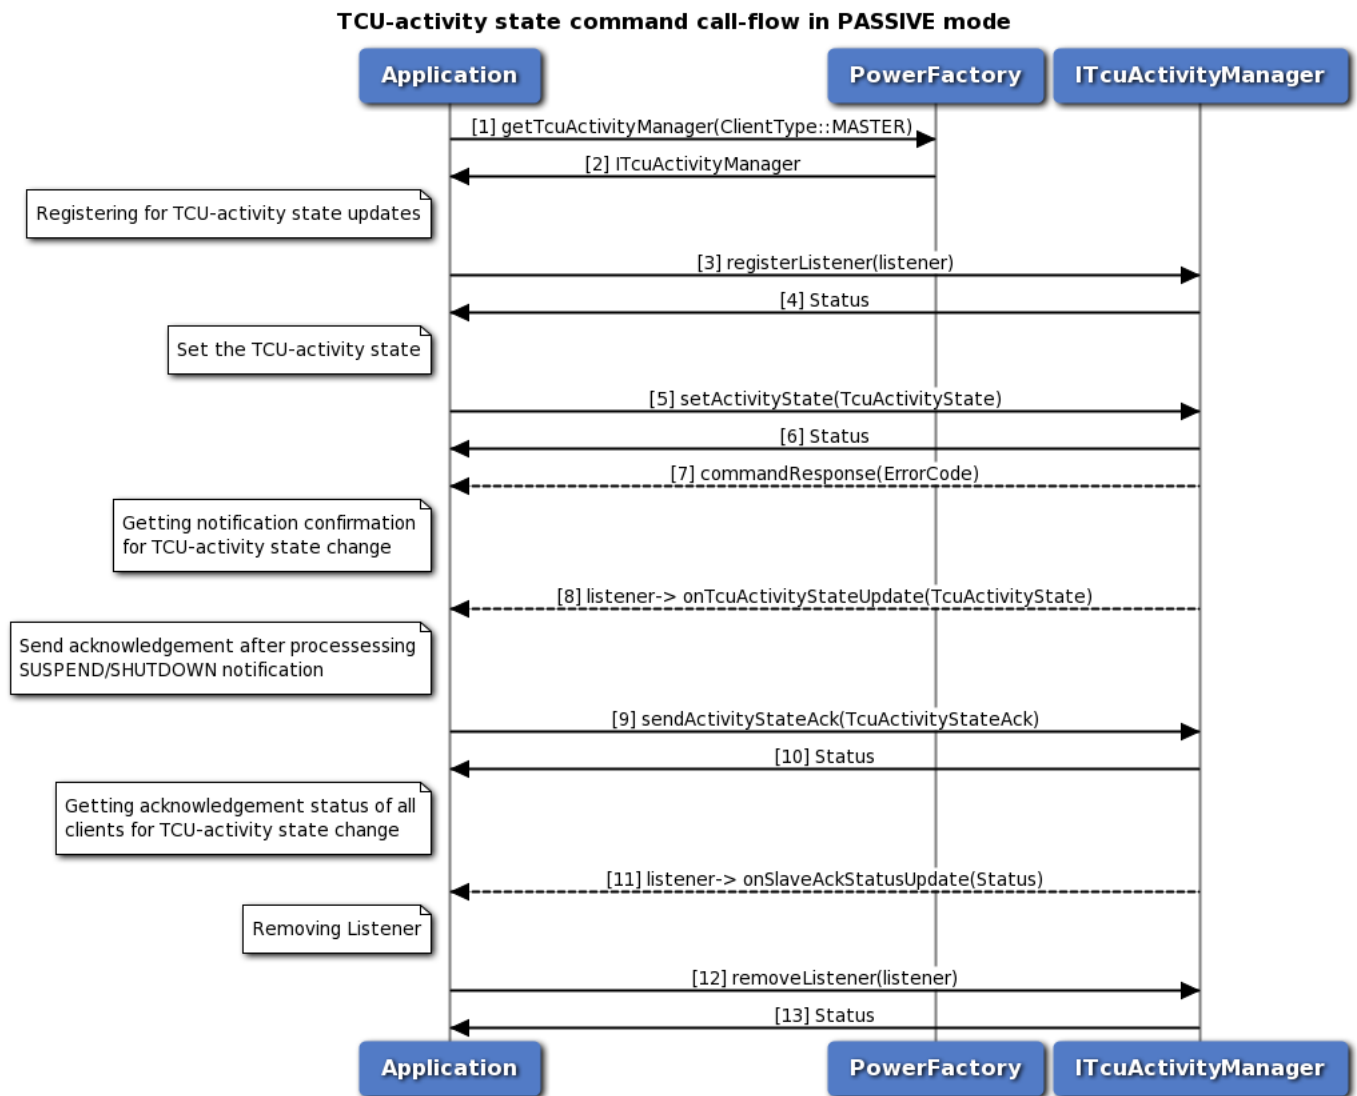

**Figure 3-111 Call flow to set the TCU-activity state in ACTIVE mode**

1. Application requests power factory for TCU-activity manager object, with clientType as MASTER.
2. Power factory returns ITcuActivityManager object using which application will set the TCU-activity state.
3. Application can register a listener for getting notifications on TCU-activity state.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application
5. Application can set the TCU-activity state to SUSPEND, RESUME or SHUTDOWN.
6. Application receives synchronous status which indicates if the request was sent successfully.
7. Optionally, the response to setActivityState request can be received by the application.
8. Application waits for TCU-activity state update to confirm the state change.
9. Application will send one(despite multiple listeners) acknowledgement, after processing(save any required information) SUSPEND/SHUTDOWN notifications. This indicates the readiness of application for state-transition. However the TCU-activity management service doesn't wait for

- acknowledgement indefinitely, before performing the state transition.
- 10. Application receives synchronous status which indicates if the acknowledgement was sent successfully.
- 11. Application can remove listener.
- 12. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

### 3.10.3 Call flow to set the TCU-activity state in PASSIVE mode

**Figure 3-112 Call flow to set the TCU-activity state in PASSIVE mode**

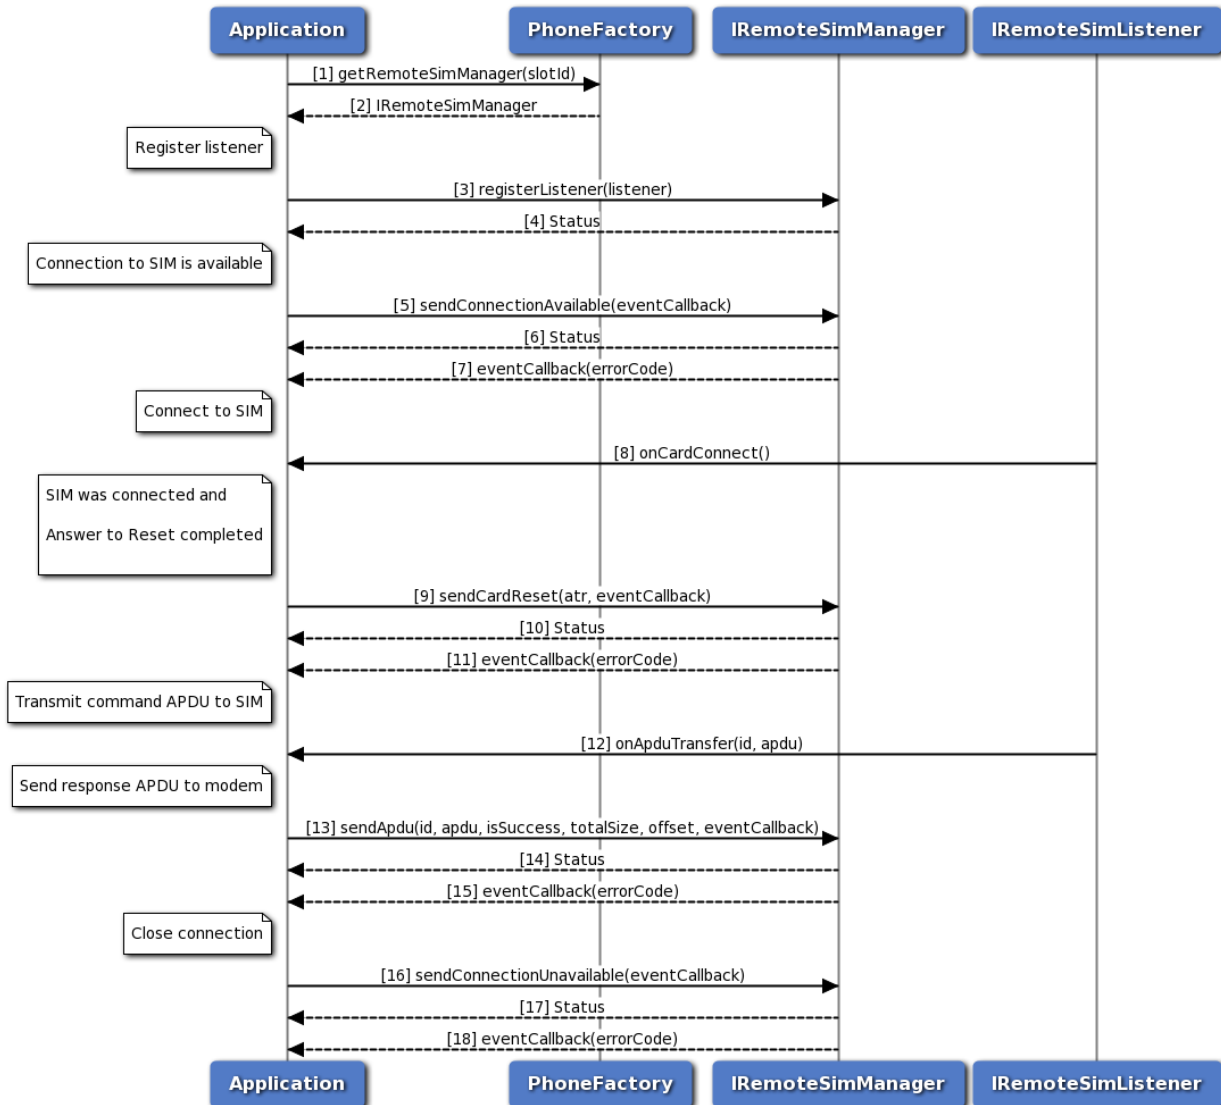

1. Application requests power factory for TCU-activity manager object, with clientType as MASTER.
2. Power factory returns ITcuActivityManager object using which application will set the TCU-activity state.
3. Application can register a listener for getting notifications on TCU-activity state.

4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application
5. Application can set the TCU-activity state to SUSPEND, RESUME or SHUTDOWN.
6. Application receives synchronous status which indicates if the request was sent successfully.
7. Optionally, the response to setActivityState request can be received by the application.
8. Application waits for TCU-activity state update to confirm the state change.
9. Application will send one(despite multiple listeners) acknowledgement, after processing(save any required information) SUSPEND/SHUTDOWN notifications. This indicates the readiness of application for state-transition. However the TCU-activity management service doesn't wait for acknowledgement indefinitely, before performing the state transition.
10. Application receives synchronous status which indicates if the acknowledgement was sent successfully.
11. Application waits for the acknowledgement status of all the clients, for the state transition in the system
12. Application can remove listener.
13. Status of remove listener i.e. either SUCCESS or FAILED will be returned to the application.

### 3.11 Remote SIM call flow

Application will get the remote SIM manager object from phone factory. The application must register a listener to receive commands/messages from the modem to send to the SIM. After sending the connection available message, a `onCardConnect()` notification tells the application to connect to the SIM and perform an Answer to Reset. After sending the card reset message (with the AtR bytes), APDU messages will begin

to be sent/received.

**Figure 3-113 Remote SIM call flow**

1. Application requests remote SIM manager object from phone factory, specifying a slot id.
2. Phone factory returns IRemoteSimManager object.
3. Application registers a listener to receive commands/messages from the modem to send to the SIM.
4. Status of register listener i.e. either SUCCESS or FAILED will be returned to the application.
5. Application sends a connection available message indicating that a SIM is available for use.
6. Status of send connection available i.e. either SUCCESS or FAILED will be returned to the application.
7. Optionally, the response to send connection available request can be received by the application.
8. Application will receive a card connect notification by the listener.

9. After the application successfully connects to the SIM and requests an AtR, it sends a card reset message with the AtR bytes.
10. Status of send card reset i.e. either SUCCESS or FAILED will be returned to the application.
11. Optionally, the response to send card reset request can be received by the application.
12. Application will receive an APDU transfer notification by the listener (with APDU message id).
13. After forwarding the APDU transfer to the SIM and receiving the response, application will send APDU response.
14. Status of send APDU i.e. either SUCCESS or FAILED will be returned to the application.
15. Optionally, the response to send APDU request can be received by the application.
16. To close the connection, application will send connection unavailable message.
17. Status of send connection unavailable i.e. either SUCCESS or FAILED will be returned to the application.
18. Optionally, the response to send connection unavailable can be received by the application.

## 3.12 Modem Config Call Flow

Modem Config manager provides APIs to request all configs from modem, load/delete modem config files from modem's storage, activate/deactivate a modem config file, get the active config details, set and get auto config selection mode. It also has listener interface for notifications for config activation update status. Application will get the Modem Config manager object from config factory. The application can register a listener for updates regarding modem config activation.

### 3.12.1 Call flow to load and activate a modem config file.

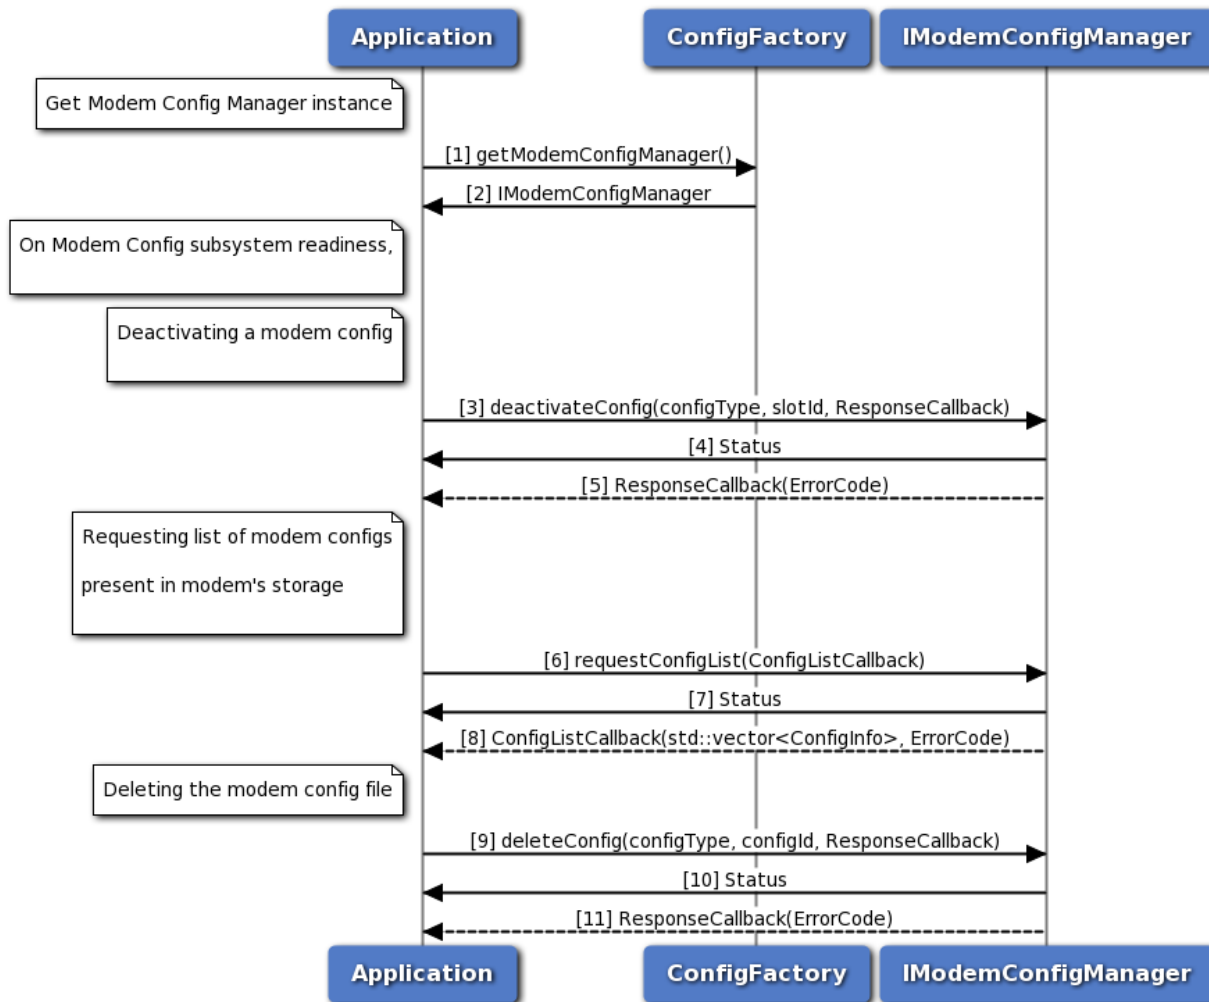

**Figure 3-114 Modem Config load and activate call flow**

1. Application requests modem config manager object from config factory.
2. Config factory returns IModemConfigManager object.
3. Application sends a request to load config file in modem's storage.
4. Application receives synchronous Status which indicates if the request to load config file was sent successfully.
5. Application is notified of the Status of the loadConfigFile request (either SUCCESS or FAILED) via the application-supplied callback.
6. Application sends a request to get list of all modem configs from modem's storage.
7. Application receives synchronous Status which indicates if the request to get config list was sent successfully.
8. Application is notified of the Status of the requestConfigList request (either SUCCESS or FAILED) via the application-supplied callback along with list of modem configs.
9. Application sends a request to activate config file.
10. Application receives synchronous Status which indicates if the request to activate config file was sent successfully.

- Application is notified of the Status of the activateConfig request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.12.2 Call flow to deactivate and delete a modem config file.

**Figure 3-115 Modem Config deactivate and delete Call Flow**

- Application requests modem config manager object from config factory.
- Config factory returns IModemConfigManager object.
- Application sends a request to deactivate config file.
- Application receives synchronous Status which indicates if the request to deactivate config file was sent successfully.
- Application is notified of the Status of the deactivateConfig request (either SUCCESS or FAILED) via the application-supplied callback.
- Application sends a request to get list of all modem configs from modem's storage.

7. Application receives synchronous Status which indicates if the request to get config list was sent successfully.
8. Application is notified of the Status of the requestConfigList request (either SUCCESS or FAILED) via the application-supplied callback along with list of modem configs.
9. Application sends a request to delete config file.
10. Application receives synchronous Status which indicates if the request to delete config file was sent successfully.
11. Application is notified of the Status of the deleteConfig request (either SUCCESS or FAILED) via the application-supplied callback.

### 3.12.3 Call flow to set and get config auto selection mode

Figure 3-116 Modem Config get and set Auto Selection Mode Call Flow

1. Application requests modem config manager object from config factory.
2. Config factory returns IModemConfigManager object.
3. Application sends a request to set config auto selection mode.
4. Application receives synchronous Status which indicates if the request to set config auto selection mode was sent successfully.
5. Application is notified of the Status of the request setAutoSelectionMode (either SUCCESS or FAILED) via the application-supplied callback.

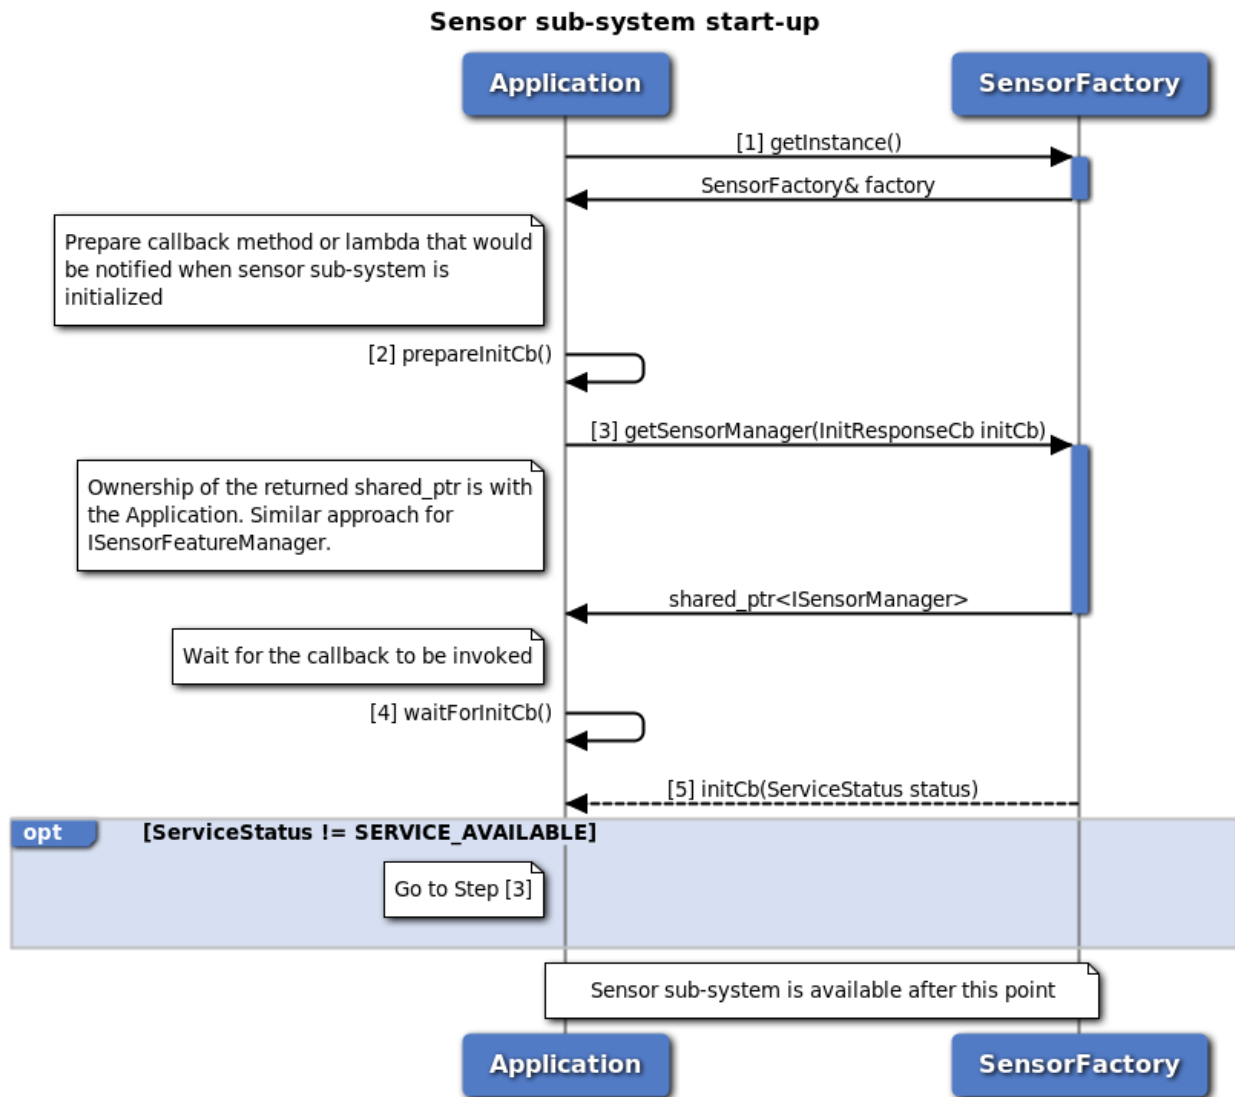

6. Application sends a request to get config auto selection mode.
7. Application receives synchronous Status which indicates if the request to get config auto selection mode was sent successfully.
8. Application is notified of the Status of the request setAutoSelectionMode (either SUCCESS or FAILED) via the application-supplied callback, along with mode and slot id.

### 3.13 Sensor

The sensor sub-system provides APIs to configure and acquire continuous stream of data from an underlying sensor, create multiple clients for a given sensor, each of which can have their own configuration (sampling rate, batch count) for data acquisition.

The sensor sub-system APIs are synchronous in nature.

### 3.13.1 Call flow for sensor sub-system start-up

**Figure 3-117 Sensor sub-system start-up call flow**

1. Get the reference to the SensorFactory, with which we can further acquire other sensor sub-system objects.
2. Prepare an initialization callback method or lambda which will be called by the sensor sub-system once the initialization is complete.
3. Request for the SensorManager from SensorFactory and provide the initialization callback. Retain the SensorManager shared\_ptr as long as necessary. SensorFactory does not hold on to the returned instance. If the received shared\_ptr is released, SensorManager would be destroyed and requesting SensorFactory for SensorManager again would result in the creation of a new instance. Similar is the approach for SensorFeatureManager.
4. Wait for the initialization callback to be invoked.

- The sensor sub-system invokes the callback once the underlying sub-system and sensor framework is available for usage. If the service status is notified as SERVICE\_FAILED, retry initialization starting with step (3). If the service status is notified as SERVICE\_AVAILABLE, the sensor sub-system is ready for usage.

### 3.13.2 Call flow for sensor data acquisition

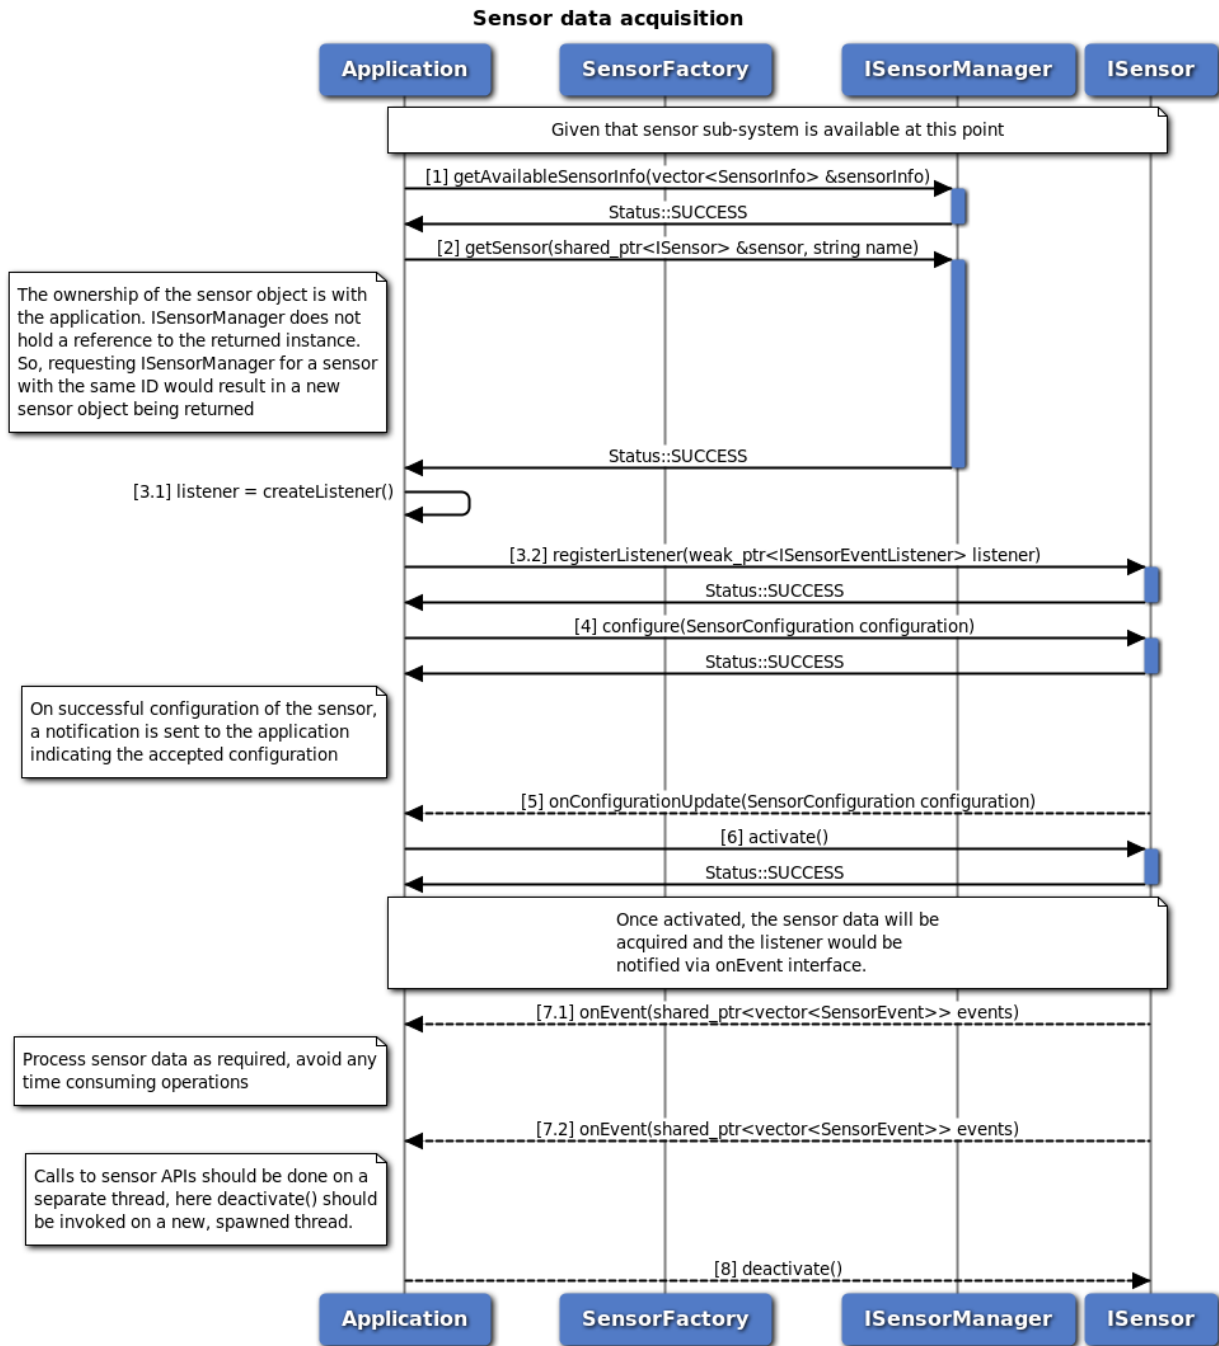

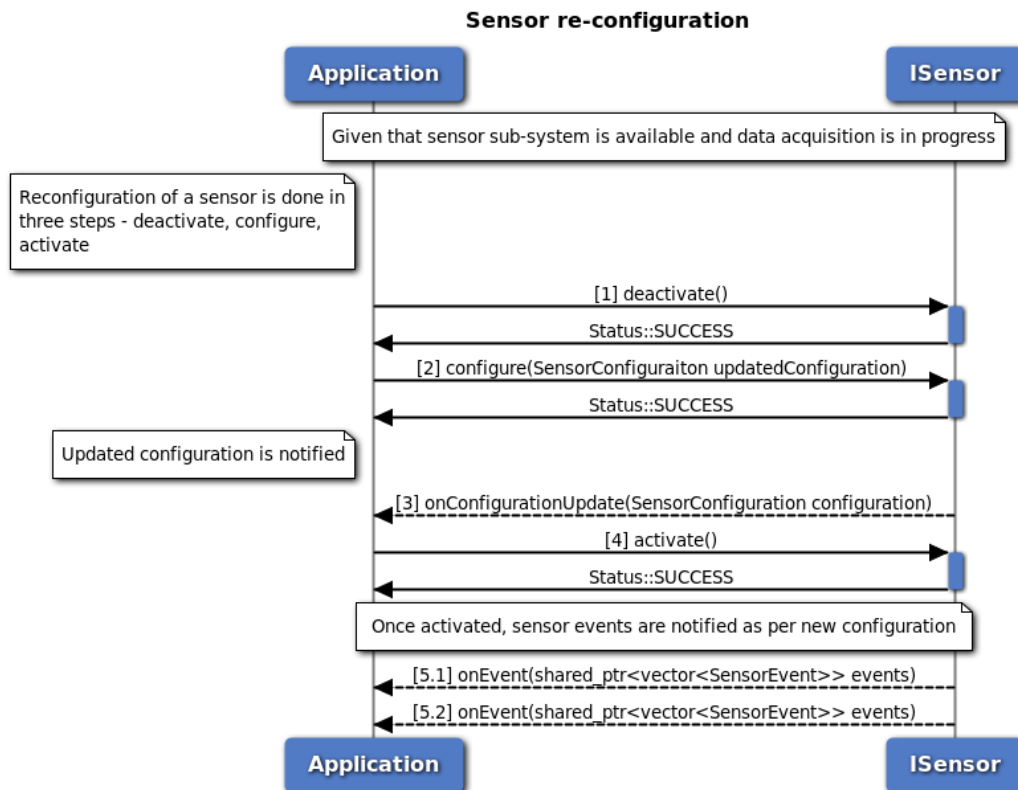

Figure 3-118 Sensor data acquisition call flow

The sensor sub-system should have been initialized successfully with SERVICE\_AVAILABLE as a pre-requisite for sensor data acquisition and a valid SensorManager object is available.

1. Get the information about available sensors from ISensorManager. The information will be provided in the sensorInfo parameter that would be passed by reference.
2. Given the information about different sensors, identify the required sensor (name of the sensor) using the provided attributes - type, name, vendor or required sampling frequency. Having identified the required sensor, request for the sensor object from ISensorManager with the required name of the sensor. If the request was successful, the provided reference to shared\_ptr<ISensor> would be set by the ISensorManager which can be used to further configure and acquire data from the sensor. The ownership of the sensor object is with the application. SensorManager does not hold a reference to the returned instance. So, requesting ISensorManager for a sensor with the same name would result in a new sensor object being returned.
3. Create a listener of type ISensorEventListener which would receive notifications about updates to sensor configuration and sensor events. Register the created listener with the sensor object.
4. Create the desired sensor configuration. For continuous data acquisition samplingRate and batchCount are necessary attributes to be set in the configuration. Be sure to set the validityMask in the SensorConfiguration structure.
5. On successful configuration, a notification is sent to the registered listeners indicating the configuration set.
6. Activate the sensor for acquiring sensor data.
7. When the sensor is activated successfully, the sensor data is sent to the registered listeners.

### 3.13.3 Call flow for sensor reconfiguration

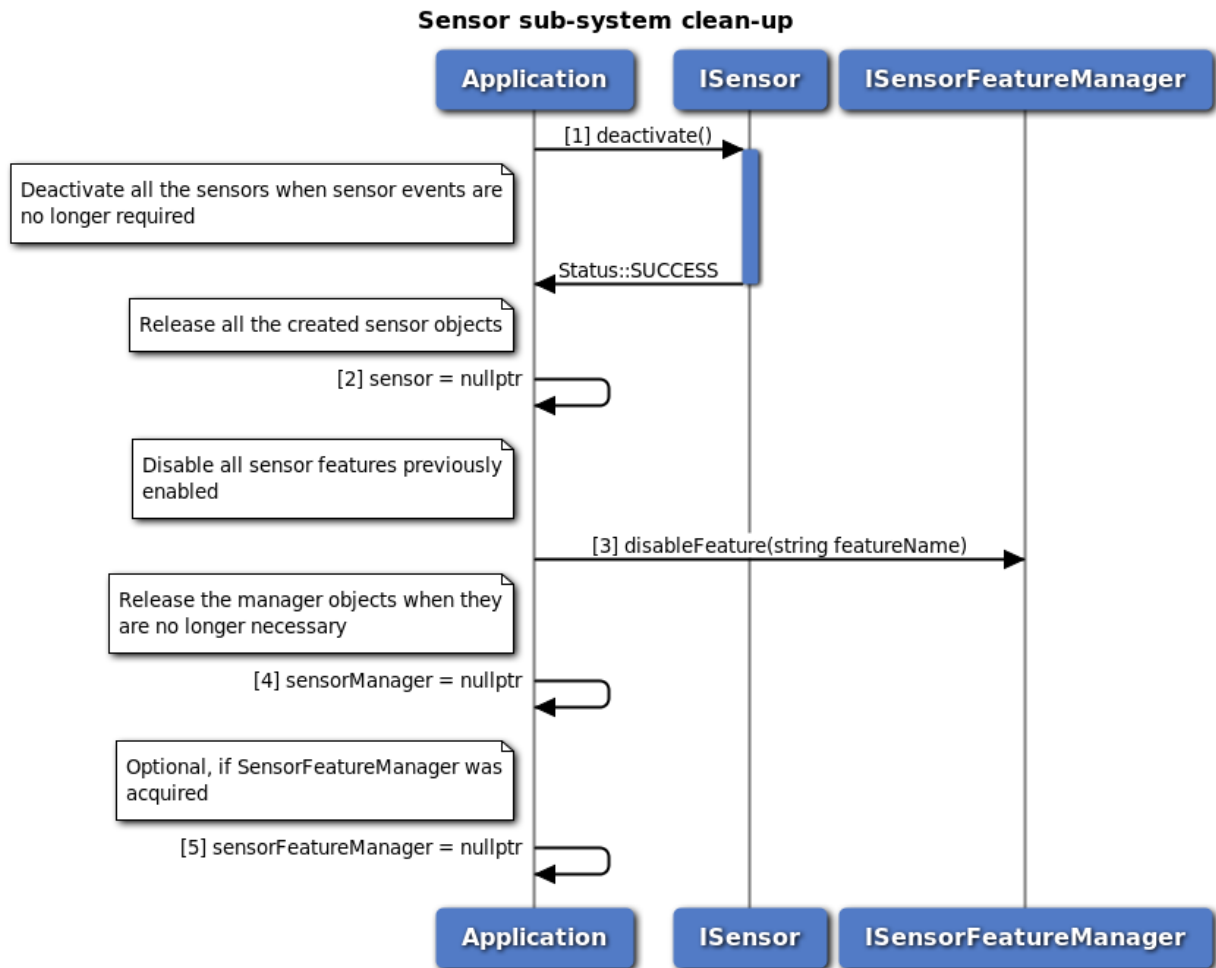

**Figure 3-119 Sensor reconfiguration call flow**

When the sensor sub-system has been initialized successfully with `SERVICE_AVAILABLE` and is already activated, reconfiguring the sensors involves the following steps.

1. Deactivate the sensor. This will stop the notifications about sensor events to the registered listeners.
2. Configure the sensor with the required attributes. Be sure to set the `validityMask` for the all required attributes in `SensorConfiguration`.
3. The underlying sub-system notifies the registered listeners about the new configuration set.
4. Activate the sensor.
5. When the sensor is activated successfully, the sensor data is sent to the registered listeners as per the new configuration.

### 3.13.4 Call flow for sensor sub-system cleanup

**Figure 3-120 Sensor sub-system cleanup call flow**

When the sensor sub-system has been initialized successfully with `SERVICE_AVAILABLE` and sensor objects have been created, the following steps ensure a cleanup of the sensor sub-system.

1. Deactivate all the sensors. With this, the registered listeners will no longer be notified of the sensor events.
2. Release all the sensor objects created by setting them to `nullptr`. Since the application owns the objects, this would result in all the sensor objects getting destroyed.
3. Disable all the sensor features that were previously enabled.
4. Release the instance of `ISensorManager` by setting it to `nullptr`. Since the application owns the object, this would result in the sensor manager getting destroyed.
5. Release the instance of `ISensorFeatureManager` by setting it to `nullptr`. Since the application owns the object, this would result in the sensor feature manager getting destroyed.

### 3.13.5 Call flow for sensor power control

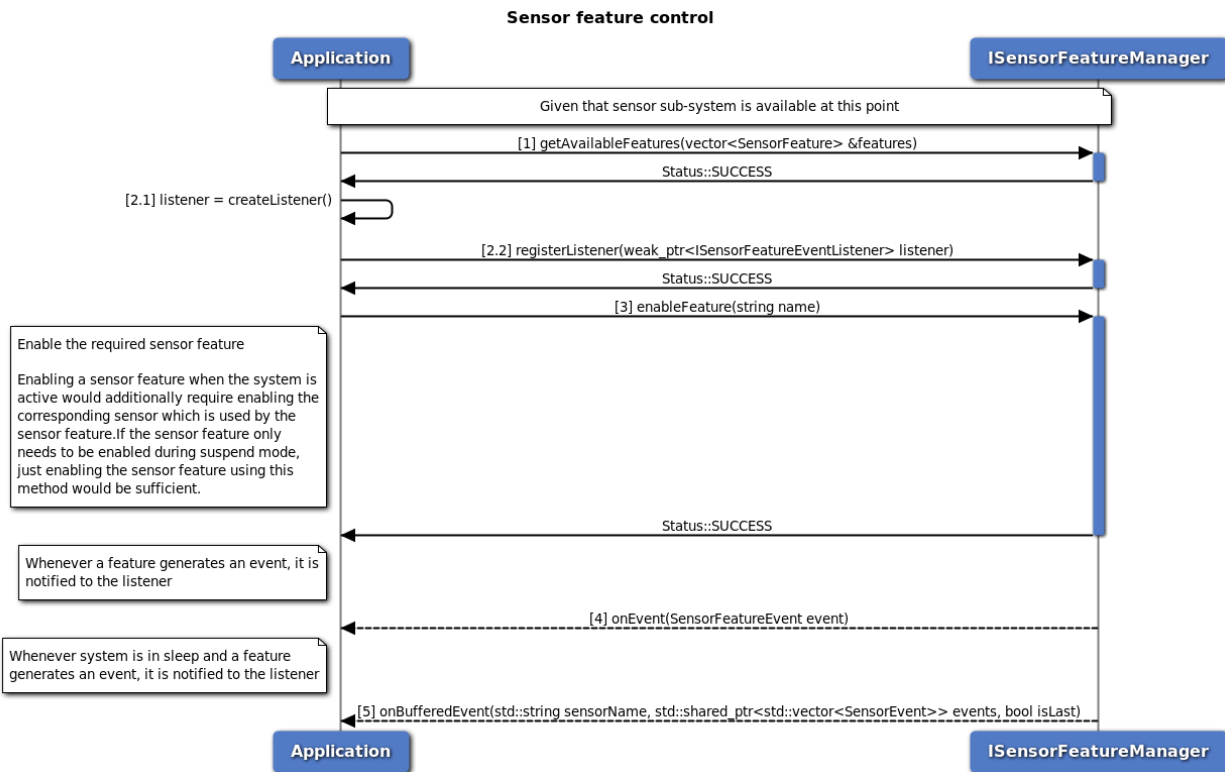

**Figure 3-121 Sensor power control cleanup call flow**

The below points are to be noted for sensor power control a) Power control is not offered by all sensor manufacturers. If the underlying hardware sensor does not support power control, the power control APIs fail. b) Enabling or disabling low power mode for the sensor is only possible when the sensor is not activated.

For achieving power control, the following steps are to be followed

1. Deactivate the sensor. This will stop the notifications about sensor events to the registered listeners.
2. Perform the required power control by enabling or disabling low power mode for the sensor.
3. Activate the sensor.
4. When the sensor is activated successfully, the sensor data is sent to the registered listeners.

### 3.13.6 Call flow for sensor feature control

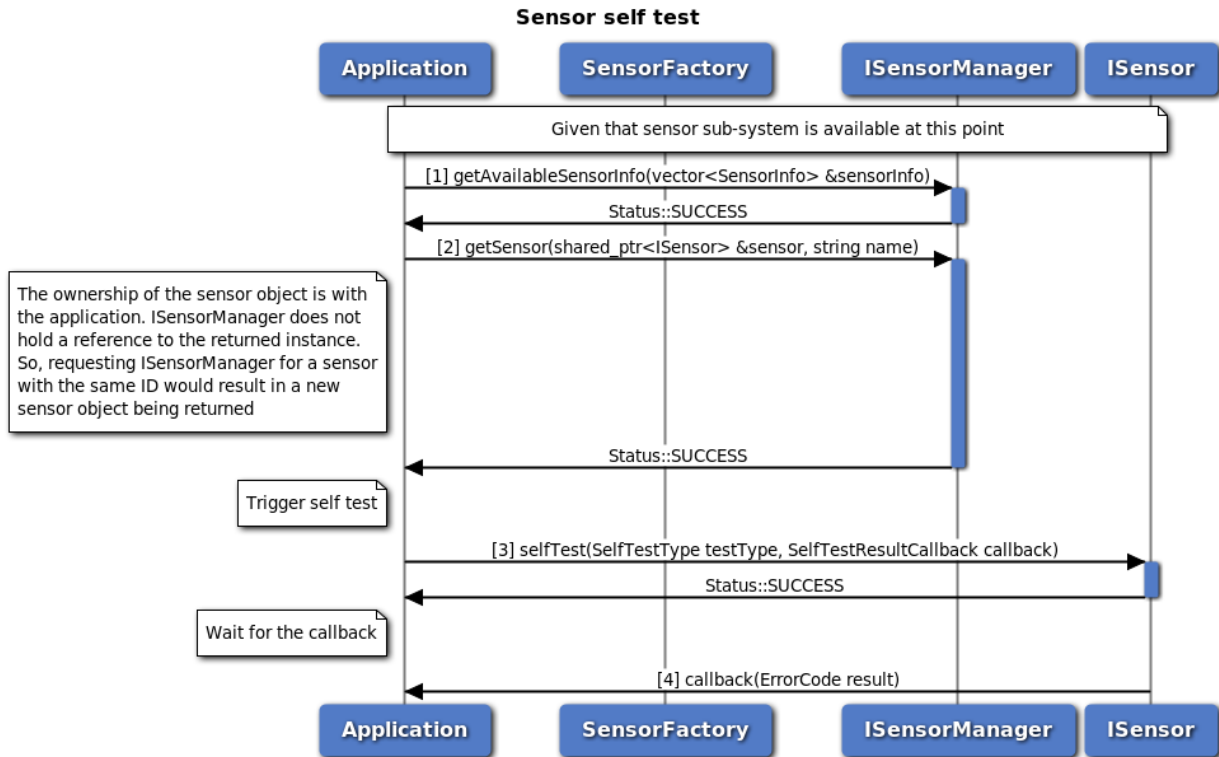

**Figure 3-122 Sensor feature control cleanup call flow**

The sensor sub-system offers certain features in addition to the data acquisition and these could be features offered by the underlying sensor hardware or the sensor software framework. If there are no features offered collectively, the sensor feature manager initialization would fail.

1. Retrieve a list of features offered by the sensor sub-system and identify the required feature that needs to be enabled. If the feature that needs to be enabled is known, this step is optional.
2. Create a sensor feature event listener, which would be notified of the different events that occur. Register this listener with the sensor feature manager.
3. Enable the required feature.
4. If system is not in sleep mode, Once the feature is enabled and an event related to the feature occurs, the listener is notified.
5. If system is in sleep mode, Once the feature is enabled and an event related to the feature occurs, the listener is notified.

### 3.13.7 Call flow for sensor self test

**Figure 3-123 Sensor self test call flow**

Certain sensors offer self test feature which can be invoked whenever needed by the application using the selfTest API. The sensor sub-system should have been initialized successfully with SERVICE\_AVAILABLE as a pre-requisite for sensor data acquisition and a valid SensorManager object is available.

1. Get the information about available sensors from ISensorManager. The information will be provided in the sensorInfo parameter that would be passed by reference.
2. Given the information about different sensors, identify the required sensor (name of the sensor) using the provided attributes - type, name, vendor or required sampling frequency. Having identified the required sensor, request for the sensor object from ISensorManager with the required name of the sensor. If the request was successful, the provided reference to shared\_ptr<ISensor> would be set by the ISensorManager which can be used to further configure and acquire data from the sensor. The ownership of the sensor object is with the application. SensorManager does not hold a reference to the returned instance. So, requesting ISensorManager for a sensor with the same name would result in a new sensor object being returned.
3. Trigger the self test with the require self test type and provide a callback that would be invoked by the sensor framework once the self test is completed.
4. Once the self test is completed, the callback gets invoked indicating the result of the self test.

## 3.14 Platform

The platform sub-system provides APIs to configure and control platform functionalities. This sub-system provides notifications about certain system related events, for instance filesystem events such as EFS restore and backup events.

### 3.14.1 Call flow for EFS restore notification registration and handling

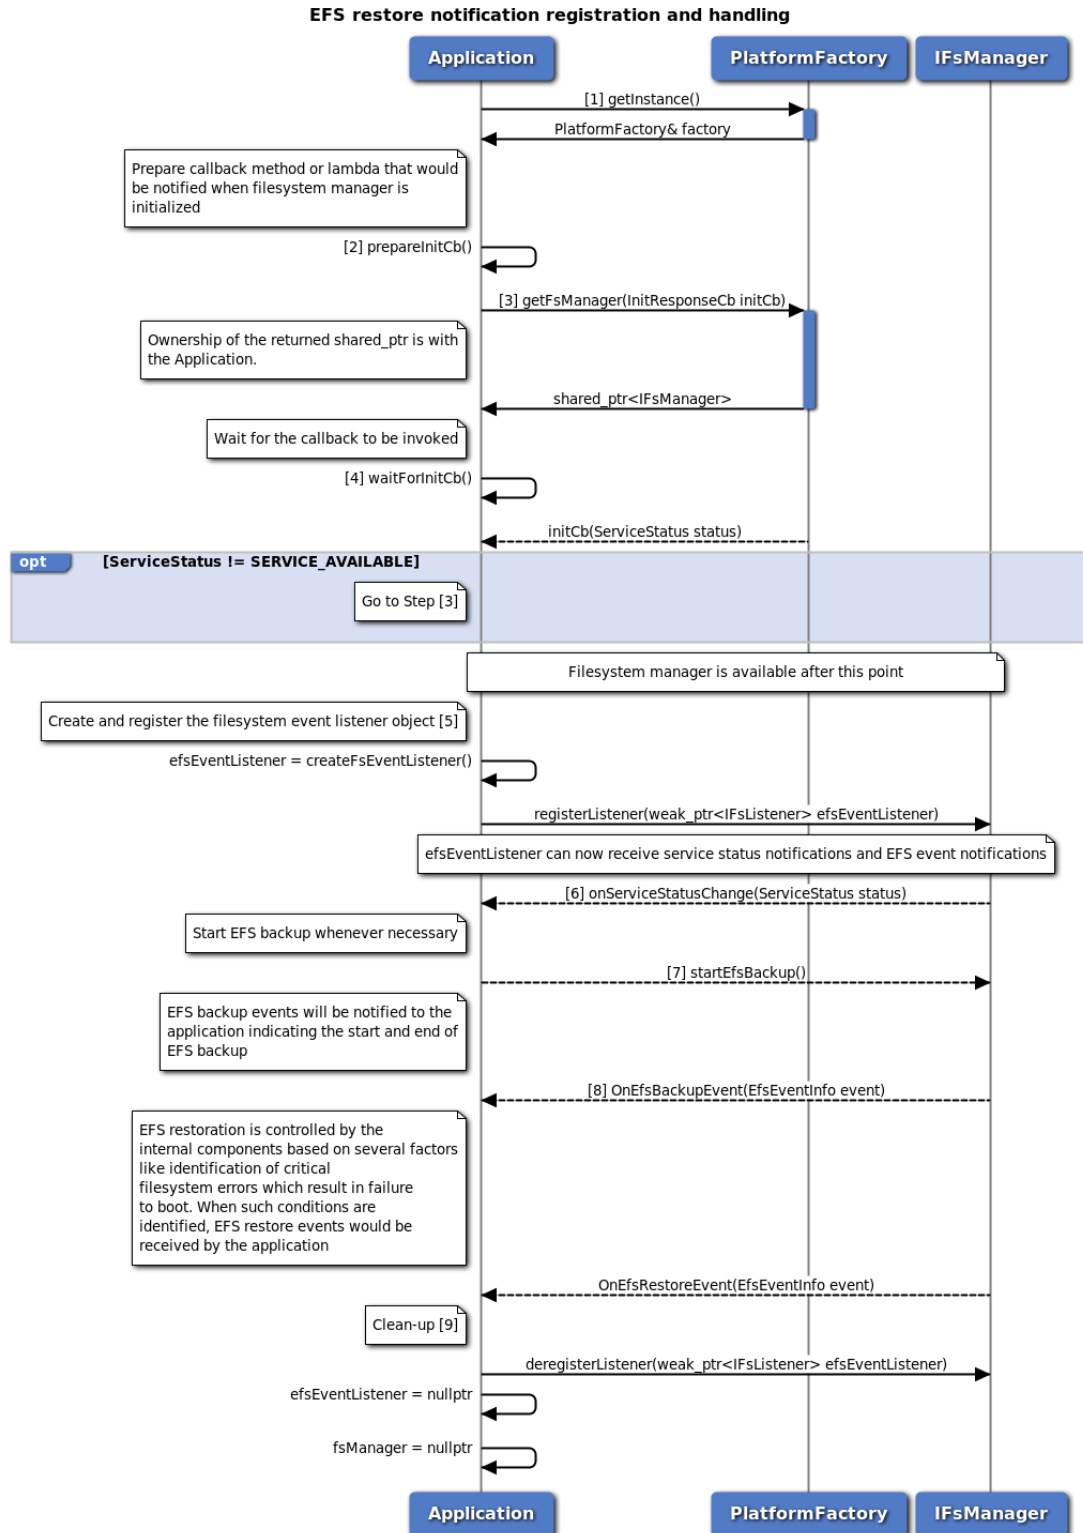

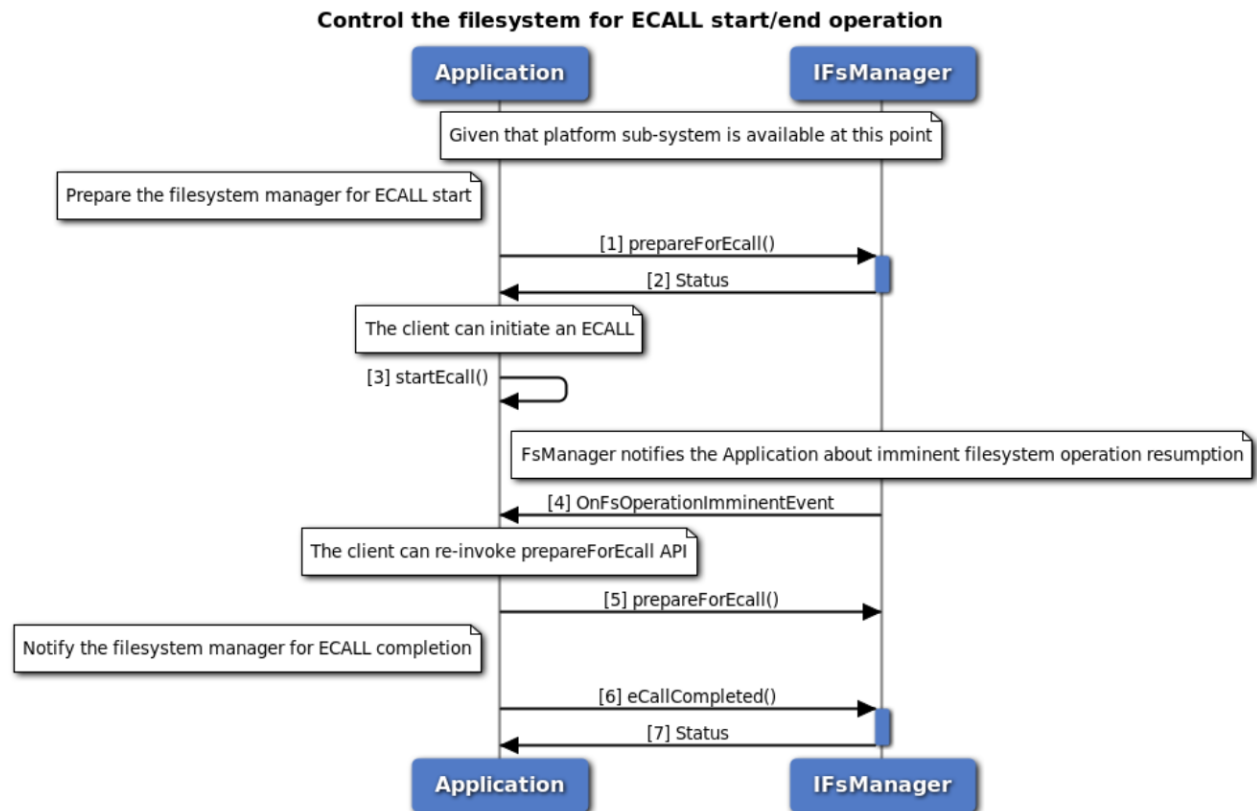

Figure 3-124 EFS restore notification registration and handling call flow

1. Get the reference to the PlatformFactory, with which we can further acquire other sub-system objects.
2. Prepare an initialization callback method or lambda which will be called by the platform sub-system once the initialization is complete.
3. Request for the IFsManager (filesystem manager) object from PlatformFactory and provide the initialization callback. Retain the IFsManager shared\_ptr as long as necessary. PlatformFactory does not hold on to the returned instance. If the received shared\_ptr is released, FsManager would be destroyed and requesting PlatformFactory for FsManager again would result in the creation of a new instance.
4. Wait for the initialization callback to be invoked. The platform sub-system invokes the callback once the underlying sub-system is available for usage. If the service status is notified as SERVICE\_FAILED, retry initialization starting with step (3). If the service status is notified as SERVICE\_AVAILABLE, the filesystem manager is ready for usage.
5. Create an listener object of type IFsListener and register with IFsManager for notifications. Once registered, the listener receives service status notifications and EFS restore event notifications.
6. If a service status notification with status SERVICE\_UNAVAILABLE, the application should wait for service to be re-initialized and once done, SERVICE\_AVAILABLE will be notified. If the service fails, SERVICE\_FAILED is notified and the IFsManager object held is no longer usable. A new object of type IFsManager needs to be re-acquired from the PlatformFactory.
7. When the application finds it appropriate to trigger a EFS backup, startEfsBackup should be invoked, which would return immediately indicating the status of the request
8. Once EFS backup starts and completes, the notifications are sent out to the application. EFS restoration is controlled by the internal components based on several factors like identification of critical filesystem errors which result in failure to boot. When such conditions are identified, EFS restore events would be received by the application via the OnEfsRestoreEvent method and the application can make use of the information appropriately. The EFS restore notification also has information if the restore started or ended and if the restore was successful or a failure.
9. Once clean-up is necessary, deregister the registered listener, set all shared pointers to nullptr. This will make the underlying sub-system relinquish resources that are no longer necessary.

### 3.14.2 Call flow of control filesystem for ECALL operation

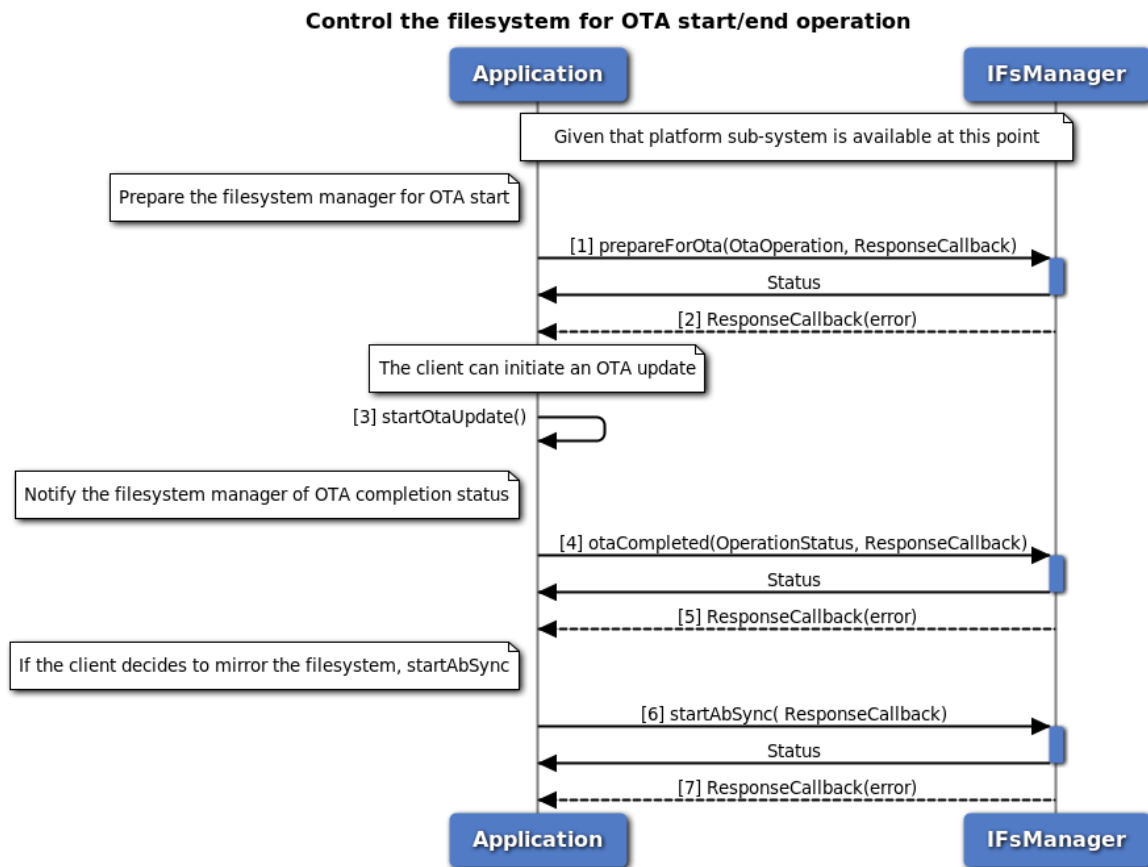

**Figure 3-125 Control the filesystem for ECALL operation call flow**

The platform sub-system should have been initialized successfully with SERVICE\_AVAILABLE as a pre-requisite for any filesystem operations and a valid FilesystemManager object is available.

1. Before initiate an eCall, the application should prepare the filesystem for eCall operation, prepareForEcall should be invoked. If the status of this request fails, the client could re-invoke during an eCall ongoing.
2. The status of the request would return immediately indicating the preparation of the filesystem operation.
3. The client should start an eCall immediately even if the prepare for eCall request failed.
4. The filesystem manager shall notify the application when filesystem operation is about to resume.
5. If the client wants to suspend the filesystem operation to continue the eCall, they should invoke the prepareForEcall API.
6. Once an eCall completes, the client should notify eCall completion to the filesystem manager. eCallCompleted should be invoked.
7. The status of the request would return immediately indication the completion of the filesystem operation.

### 3.14.3 Call flow of control filesystem for OTA operation

**Figure 3-126 Control the filesystem for OTA operation call flow**

The platform sub-system should have been initialized successfully with `SERVICE_AVAILABLE` as a pre-requisite for any filesystem operations and a valid `FileManager` object is available.

1. Before initiate an OTA update, the application should prepare the filesystem for the OTA operation, `prepareForOta` should be invoked, which would return immediately indicating the status of the request.
2. Once the filesystem has prepared for the OTA operation, the filesystem manager would invoke the callback which indicates the response of the API.
3. Once the filesystem has prepared for the OTA operation, the client could initiate an OTA update.
4. On OTA update completion, the client should notify the filesystem manager of the OTA completion status, `otaCompleted` should be invoked, which would return immediately indicating the status of the request.
5. The filesystem manager would intern update the OTA status, the callback would invoked which indicates the response of the API.
6. If the client decides to mirror the system, `startAbSync` should be invoked which would return immediately indicating the status of the request.

7. Once the filesystem partition sync operation complete, the filesystem manager would invoke the callback which indicates the response of the API.

# 4 Deprecated List

---

**Global `telux::audio::IAudioManager::isSubsystemReady ()=0`**

Use `getServiceStatus` API

**Global `telux::audio::IAudioManager::onSubsystemReady ()=0`**

Use `InitResponseCb` callback in factory API `getAudioManager`.

**Global `telux::audio::StreamConfig::modemSubId`**

Represents modem Subscription ID, Default set to 1. Applicable only for Voice Call

**Global `telux::cv2x::ICv2xConfig::isReady ()=0`**

use `getServiceStatus` instead

**Global `telux::cv2x::ICv2xConfig::onReady ()=0`**

the readiness can be notified via the callback passed to `Cv2xFactory::getCv2xConfig`.

**Global `telux::cv2x::ICv2xListener::onStatusChanged (Cv2xStatus status)`**

use `onStatusChanged(Cv2xStatusEx status)`

**Global `telux::cv2x::ICv2xRadio::getCapabilities () const =0`**

Use `requestCapabilities()` API

**Global `telux::cv2x::ICv2xRadioListener::onSpsOffsetChanged (int spsId, MacDetails details)`**

use `onSpsSchedulingChanged`

**Global `telux::cv2x::ICv2xRadioListener::onStatusChanged (Cv2xStatusEx status)`**

use `onStatusChanged` in `Cv2xListener`

**Global `telux::cv2x::ICv2xRadioListener::onStatusChanged (Cv2xStatus status)`**

use `onStatusChanged` in `Cv2xListener`

**Global `telux::cv2x::ICv2xRadioManager::isReady ()=0`**

use `getServiceStatus` instead

**Global `telux::cv2x::ICv2xRadioManager::onReady ()=0`**

the readiness can be notified via the callback passed to `Cv2xFactory::getCv2xRadioManager`.

**Global `telux::cv2x::ICv2xRadioManager::requestCv2xStatus (RequestCv2xStatusCallback cb)=0`**

use `requestCv2xStatus(RequestCv2xCalbackEx)`

**Global `telux::cv2x::ICv2xRadioManager::updateConfiguration`** (`const std::string &configFilePath, UpdateConfigurationCallback cb`)=0

Use `ICv2xConfig` instead

**Global `telux::cv2x::RequestCv2xStatusCallback`**

use `RequestCv2xStatusCallbackEx`

**Global `telux::cv2x::TrustedUEInfo::timeConfidenceLevel`**

Use `timeUncertainty` Time confidence level. Range from 0 to 127 with 0 being invalid/unavailable and 127 being the most confident.

**Global `telux::data::BitRateInfo::rxRate`**

Unused

**Global `telux::data::BitRateInfo::txRate`**

Unused

**Global `telux::data::IDataConnectionManager::isSubsystemReady`** ()=0

Use `getServiceStatus` API.

**Global `telux::data::IDataConnectionManager::onSubsystemReady`** ()=0

Use `InitResponseCb` callback in factory API `getDataConnectionManager`.

**Global `telux::data::IDataFilterManager::isReady`** ()=0

Use `getServiceStatus` API.

**Global `telux::data::IDataFilterManager::onReady`** ()=0

Use `InitResponseCb` callback in factory API `getDataFilterManager`.

**Global `telux::data::IDataProfileManager::isSubsystemReady`** ()=0

Use `getServiceStatus` API.

**Global `telux::data::IDataProfileManager::onSubsystemReady`** ()=0

Use `InitResponseCb` callback in factory API `getDataProfileManager`.

**Global `telux::data::net::IBridgeManager::isSubsystemReady`** ()=0

Use `getServiceStatus` API.

**Global `telux::data::net::IBridgeManager::onSubsystemReady`** ()=0

Use `InitResponseCb` callback in factory API `getBridgeManager`.

**Global `telux::data::net::IFirewallManager::isSubsystemReady`** ()=0

Use `getServiceStatus` API.

**Global `telux::data::net::IFirewallManager::onSubsystemReady`** ()=0

Use `InitResponseCb` callback in factory API `getFirewallManager`.

**Global `telux::data::net::INatManager::isSubsystemReady`** ()=0

Use `getServiceStatus` API.

**Global `telux::data::net::INatManager::onSubsystemReady ()=0`**

Use `InitResponseCb` callback in factory API `getNatManager`.

**Global `telux::data::net::ISocksManager::isSubsystemReady ()=0`**

Use `getServiceStatus` API..

**Global `telux::data::net::ISocksManager::onSubsystemReady ()=0`**

Use `InitResponseCb` callback in factory API `getSocksManager`.

**Global `telux::data::net::IVlanManager::isSubsystemReady ()=0`**

Use `getServiceStatus` API.

**Global `telux::data::net::IVlanManager::onSubsystemReady ()=0`**

Use `InitResponseCb` callback in factory API `getVlanManager`.

**Global `telux::loc::COMPASS`**

constellation type is not supported.

**Global `telux::loc::GNSS_LOC_SV_SYSTEM_COMPASS`**

constellation type is not supported.

**Global `telux::loc::IDgnssManager::isSubsystemReady ()=0`**

use `getServiceStatus()`

**Global `telux::loc::IDgnssManager::onSubsystemReady ()=0`**

The callback mechanism introduced in the `LocationFactory::getDgnssManager()` API will provide the similar notification mechanism as `onSubsystemReady()`. This API will soon be removed from further releases.

**Global `telux::loc::ILocationConfigurator::isSubsystemReady ()=0`**

use `getServiceStatus()`

**Global `telux::loc::ILocationConfigurator::onSubsystemReady ()=0`**

The callback mechanism introduced in the `LocationFactory::getLocationConfigurator()` API will provide the similar notification mechanism as `onSubsystemReady()`. This API will soon be removed from further releases.

**Global `telux::loc::ILocationManager::isSubsystemReady ()=0`**

use `getServiceStatus()`

**Global `telux::loc::ILocationManager::onSubsystemReady ()=0`**

The callback mechanism introduced in the `LocationFactory::getLocationManager()` API will provide the similar notification mechanism as `onSubsystemReady()`. This API will soon be removed from further releases.

**Global `telux::loc::LEVER_ARM_TYPE_VEPP_IMU_TO_GNSS`**

enum type is not supported.

**Global `telux::power::ITcuActivityManager::isReady ()=0`**

Use `ITcuActivityManager::getServiceStatus()` API.  
[telux::power::ITcuActivityManager::getServiceStatus](#)

**Global `telux::power::ITcuActivityManager::onReady ()=0`**

Use `InitResponseCb` in `PowerFactory::getTcuActivityManager` instead, to get notified about subsystem readiness [telux::power::PowerFactory::getTcuActivityManager](#)

**Global `telux::tel::GsmSignalStrengthInfo::getGsmBitErrorRate () const`**

This API not being supported

**Global `telux::tel::GsmSignalStrengthInfo::getTimingAdvance ()`**

This API not being supported

**Global `telux::tel::ICall::reject (const std::string &rejectSMS, std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr)=0`**

This API not being supported

**Global `telux::tel::ICallListener::onECallMsdTransmissionStatus (int phoneId, telux::common::IErrorCodes::ErrorCode errorCode)`**

Use another `onECallMsdTransmissionStatus()` API with argument `ECallMsdTransmissionStatus`

**Global `telux::tel::INetworkSelectionManager::isSubsystemReady ()=0`**

Use `INetworkSelectionManager::getServiceStatus()` API.

**Global `telux::tel::INetworkSelectionManager::onSubsystemReady ()=0`**

Use `InitResponseCb` in `PhoneFactory::getNetworkSelectionManager` instead, to get notified about subsystem readiness.

**Global `telux::tel::INetworkSelectionManager::performNetworkScan (NetworkScanCallback callback)=0`**

Use `INetworkSelectionManager::performNetworkScan( common::ResponseCallback callback)` API instead

**Global `telux::tel::IPhone::getRadioState ()=0`**

Use `IPhoneManager::requestOperatingMode()` API instead

**Global `telux::tel::IPhone::getServiceState ()=0`**

Use `requestVoiceServiceState()` API

**Global `telux::tel::IPhone::requestVoiceRadioTechnology (VoiceRadioTechResponseCb callback)=0`**

Use `requestVoiceServiceState()` API to get `VoiceServiceInfo` which has API to get radio technology i.e `VoiceServiceInfo::getRadioTechnology()`

**Global `telux::tel::IPhone::setRadioPower (bool enable, std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr)=0`**

Use `IPhoneManager::setOperatingMode()` API instead

**Global `telux::tel::IPhoneListener::onRadioStateChanged (int phoneId, RadioState radioState)`**

Use `onOperatingModeChanged()` API instead

**Global `telux::tel::IPhoneListener::onServiceStateChanged (int phoneId, ServiceState state)`**

Use `onVoiceServiceStateChanged()` listener

**Global `telux::tel::IPhoneListener::onVoiceRadioTechnologyChanged (int phoneId, RadioTechnology radioTech)`**

Use `onVoiceServiceStateChanged()` API instead

**Global `telux::tel::ISapCardManager::getState (SapState &sapState)=0`**

Use `requestSapState()` API below to get SAP state

**Global `telux::tel::IServingSystemManager::isSubsystemReady ()=0`**

Use `IServingSystemManager::getServiceStatus()` API.

**Global `telux::tel::IServingSystemManager::onSubsystemReady ()=0`**

Use `InitResponseCb` in `PhoneFactory::getServingSystemManager` instead, to get notified about subsystem readiness.

**Global `telux::tel::ISmsManager::sendSms (const std::string &message, const std::string &receiverAddress, std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr, std::shared_ptr< telux::common::ICommandResponseCallback > deliveryCallback=nullptr)=0`**

Use API `ISmsManager::sendSms(const std::string &message, const std::string &receiverAddress, bool deliveryReportNeeded = true, SmsResponseCb callback = nullptr, std::string smscAddr = "")`

**Global `telux::tel::ISubscription::getMcc ()=0`**

Use `telux::tel::ISubscription::getMobileCountryCode()` API instead

**Global `telux::tel::ISubscription::getMnc ()=0`**

Use `telux::tel::ISubscription::getMobileNetworkCode()` API instead

**Global `telux::tel::LteSignalStrengthInfo::getLteChannelQualityIndicator () const`**

This API not being supported

**Global `telux::tel::LteSignalStrengthInfo::getTimingAdvance () const`**

This API not being supported

**Global `telux::tel::ServiceState`**

Use `requestVoiceServiceState()` API or to know the status of phone

**Global `telux::tel::SmsMessage::getPdu () const`**

Use API `SmsMessage::getRawPdu`

**Global `telux::tel::VoiceRadioTechResponseCb`**

Use `IVoiceServiceStateCallback` instead

**Global `telux::tel::WcdmaSignalStrengthInfo::getBitErrorRate () const`**

This API not being supported

**Global `telux::therm::IThermalShutdownManager::isReady ()=0`**

use `getServiceStatus()`

**Global `telux::therm::IThermalShutdownManager::onReady ()=0`**

The callback mechanism introduced in the `ThermalFactory::getThermalShutdownManager` with initialization callback along with `getServiceStatus` API will provide the similar mechanism as `onReady` and `isReady`. This API will soon be removed from further releases.

**Global `v2x_event_t`**

This enum type is deprecated, please consider use `v2x_radio_status_ex_t` instead.

**Global `v2x_radio_calls_t::v2x_radio_status_listener )(v2x_event_t event, void *context)`**

This callback is deprecated, please consider use `v2x_ext_radio_status_listener` instead.

**Global `v2x_radio_init_v2 (traffic_ip_type_t ip_type, v2x_concurrency_sel_t mode, v2x_radio_calls_t *callbacks_p, void *ctx_p)`**

This API has been deprecated. Please use `v2x_radio_init_v3()` instead.

- `std::shared_ptr< IHttpTransactionManager > getHttpTransactionManager (telux::common::InitResponseCb callback=nullptr)`
- `std::shared_ptr< IImServingSystemManager > getImServingSystemManager (SlotId slotId, telux::common::InitResponseCb callback=nullptr)`
- `virtual std::shared_ptr< ISuppServicesManager > getSuppServicesManager (SlotId slotId=DEFAULT_SLOT_ID, telux::common::InitResponseCb callback=nullptr)`

##### Static Public Member Functions

- static `PhoneFactory & getInstance ()`

### 5.3.1.1.1 Member Function Documentation

#### 5.3.1.1.1.1 static PhoneFactory& telux::tel::PhoneFactory::getInstance ( ) [static]

Get Phone Factory instance.

#### 5.3.1.1.1.2 std::shared\_ptr<IPhoneManager> telux::tel::PhoneFactory::getPhoneManager ( )

Get Phone Manager instance. Phone Manager is the main entry point into the telephony subsystem.

#### Returns

Pointer of [IPhoneManager](#) object.

#### 5.3.1.1.1.3 std::shared\_ptr<ISmsManager> telux::tel::PhoneFactory::getSmsManager ( int *phoneId* = *DEFAULT\_PHONE\_ID*, telux::common::InitResponseCb *callback* = *nullptr* )

Get SMS Manager instance for Phone ID. SMSManager used to send and receive SMS messages.

#### Parameters

in	<i>phoneId</i>	Unique identifier for the phone
in	<i>callback</i>	Optional callback pointer to get response of SMS Manager initialization. It will be invoked when initialization is either succeeded or failed. In case of failure response, the provided SMS Manager object will no more be a valid object.

#### Returns

Pointer of [ISmsManager](#) object or *nullptr* in case of failure.

#### 5.3.1.1.1.4 std::shared\_ptr<ICallManager> telux::tel::PhoneFactory::getCallManager ( telux↔::common::InitResponseCb *callback* = *nullptr* )

Get Call Manager instance to determine state of active calls and perform other functions like dial, conference, swap call.

#### Parameters

in	<i>callback</i>	Optional callback pointer to get response of CallManager initialization. It will be invoked when initialization is either succeeded or failed. In case of failure response, the provided Call Manager object will no more be a valid object.
----	-----------------	--

#### Returns

Pointer of [ICallManager](#) object or *nullptr* in case of failure.

#### 5.3.1.1.1.5 `std::shared_ptr<ICardManager> telux::tel::PhoneFactory::getCardManager ( )`

Get Card Manager instance to handle services such as transmitting APDU, SIM IO and more.

#### Returns

Pointer of [ICardManager](#) object.

#### 5.3.1.1.1.6 `std::shared_ptr<ISapCardManager> telux::tel::PhoneFactory::getSapCardManager ( int slotId = DEFAULT_SLOT_ID )`

Get Sap Card Manager instance associated with the provided slot id. This object will handle services in SAP mode such as APDU, SIM Power On/Off and SIM reset.

#### Parameters

in	<i>slotId</i>	Unique identifier for the SIM slot
----	---------------	------------------------------------

#### Returns

Pointer of [ISapCardManager](#) object.

#### 5.3.1.1.1.7 `std::shared_ptr<ISubscriptionManager> telux::tel::PhoneFactory::getSubscriptionManager ( )`

Get Subscription Manager instance to get device subscription details

#### Returns

Pointer of [ISubscriptionManager](#) object.

#### 5.3.1.1.1.8 `std::shared_ptr<IServingSystemManager> telux::tel::PhoneFactory::getServingSystemManager ( int slotId = DEFAULT_SLOT_ID, telux::common::InitResponseCb callback = nullptr )`

Get Serving System Manager instance to get and set preferred network type.

#### Parameters

in	<i>slotId</i>	Unique identifier for the SIM slot
in	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.

#### Returns

Pointer of [IServingSystemManager](#) object.

**5.3.1.1.1.9** `std::shared_ptr<INetworkSelectionManager> telux::tel::PhoneFactory::getNetworkSelectionManager ( int slotId = DEFAULT_SLOT_ID, telux::common::InitResponseCb callback = nullptr )`

Get Network Selection Manager instance to get and set selection mode, get and set preferred networks and scan available networks.

#### Parameters

in	<i>slotId</i>	Unique identifier for the SIM slot
in	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.

#### Returns

Pointer of [INetworkSelectionManager](#) object.

**5.3.1.1.1.10** `std::shared_ptr<IRemoteSimManager> telux::tel::PhoneFactory::getRemoteSimManager ( int slotId = DEFAULT_SLOT_ID )`

Get Remote SIM Manager instance to handle services like exchanging APDU, SIM Power On/Off, etc.

#### Parameters

in	<i>slotId</i>	Unique identifier for the SIM slot
----	---------------	------------------------------------

#### Returns

Pointer of [IRemoteSimManager](#) object.

**5.3.1.1.1.11** `std::shared_ptr<IMultiSimManager> telux::tel::PhoneFactory::getMultiSimManager ( )`

Get Multi SIM Manager instance to handle operations like high capability switch.

#### Returns

Pointer of [IMultiSimManager](#) object.

**5.3.1.1.1.12** `std::shared_ptr<ICellBroadcastManager> telux::tel::PhoneFactory::getCellBroadcastManager ( SlotId slotId = DEFAULT_SLOT_ID )`

Get CellBroadcast Manager instance for Slot ID. CellBroadcast manager used to receive broadcast messages and configure broadcast messages.

#### Parameters

in	<i>SlotId</i>	telux::common::SlotId
----	---------------	-----------------------

**Returns**

Pointer of [ICellBroadcastManager](#) object or nullptr in case of failure.

**5.3.1.1.1.13 std::shared\_ptr<ISimProfileManager> telux::tel::PhoneFactory::getSimProfileManager ( )**

Get SimProfileManager. SimProfileManager is a primary interface for remote eUICC(eSIM) provisioning and local profile assistance.

**Returns**

Pointer of [ISimProfileManager](#) object or nullptr in case of failure.

**5.3.1.1.1.14 std::shared\_ptr<IImSettingsManager> telux::tel::PhoneFactory::getImSettingsManager ( telux::common::InitResponseCb callback = nullptr )**

Get Ims Settings Manager instance to handle IMS service enable configuration parameters like enable/disable voIMS.

**Parameters**

in	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.
----	-----------------	--

**Returns**

Pointer of [IImSettingsManager](#) object.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.3.1.1.1.15 std::shared\_ptr<IHttpTransactionManager> telux::tel::PhoneFactory::getHttpTransactionManager ( telux::common::InitResponseCb callback = nullptr )**

Get HttpTransactionManager instance to handle HTTP related requests from the modem for SIM profile update related operations.

**Parameters**

in	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.
----	-----------------	--

**Returns**

Pointer of [IHttpTransactionManager](#) object or nullptr in case of failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.3.1.1.1.16** `std::shared_ptr<IImServingSystemManager> telux::tel::PhoneFactory::getImServingSystemManager ( SlotId slotId, telux::common::InitResponseCb callback = nullptr )`

Get IMS Serving System Manager instance to query IMS registration status

**Returns**

Pointer of [IImServingSystemManager](#) object or `nullptr` in case of failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.3.1.1.1.17** `virtual std::shared_ptr<ISuppServicesManager> telux::tel::PhoneFactory::getSuppServicesManager ( SlotId slotId = DEFAULT_SLOT_ID, telux::common::InitResponseCb callback = nullptr ) [virtual]`

Get Supplementary service manager instance to set/get preference for supplementary services like call waiting, call forwarding etc.

**Parameters**

in	<i>SlotId</i>	telux::common::SlotId
in	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.

**Returns**

Pointer of [ISuppServicesManager](#) object.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.4 Phone

This section contains APIs related to Phone, Signal Strength and interfaces to register global listeners to event notifications.

### 5.4.1 Data Structure Documentation

#### 5.4.1.1 class `telux::tel::GsmCellIdentity`

`GsmCellIdentity` class provides methods to get mobile country code, mobile network code, location area code, cell identity, absolute RF channel number and base station identity code.

##### Public member functions

- `GsmCellIdentity` (int *mcc*, int *mnc*, int *lac*, int *cid*, int *arfcn*, int *bsic*)
- const int `getMcc` ()
- const int `getMnc` ()
- const int `getLac` ()
- const int `getIdentity` ()
- const int `getArfcn` ()
- const int `getBaseStationIdentityCode` ()

##### 5.4.1.1.1 Constructors and Destructors

5.4.1.1.1 `telux::tel::GsmCellIdentity::GsmCellIdentity ( int mcc, int mnc, int lac, int cid, int arfcn, int bsic )`

##### 5.4.1.1.2 Member Function Documentation

5.4.1.1.2.1 `const int telux::tel::GsmCellIdentity::getMcc ( )`

Get the Mobile Country Code.

##### Returns

Mcc value.

5.4.1.1.2.2 `const int telux::tel::GsmCellIdentity::getMnc ( )`

Get the Mobile Network Code.

##### Returns

Mnc value.

#### 5.4.1.1.2.3 `const int telux::tel::GsmCellIdentity::getLac ( )`

Get the location area code.

##### Returns

Location area code.

#### 5.4.1.1.2.4 `const int telux::tel::GsmCellIdentity::getIdentity ( )`

Get the cell identity.

##### Returns

Cell identity.

#### 5.4.1.1.2.5 `const int telux::tel::GsmCellIdentity::getArfcn ( )`

Get the absolute RF channel number.

##### Returns

Absolute RF channel number.

#### 5.4.1.1.2.6 `const int telux::tel::GsmCellIdentity::getBaseStationIdentityCode ( )`

Get the base station identity code.

##### Returns

Base station identity code.

### 5.4.1.2 `class telux::tel::CdmaCellIdentity`

[CdmaCellIdentity](#) class provides methods to get the network identifier, system identifier, base station identifier, longitude and latitude.

##### Public member functions

- [CdmaCellIdentity](#) (int networkId, int systemId, int baseStationId, int longitude, int latitude)
- `const int getNid ( )`
- `const int getSid ( )`
- `const int getBaseStationId ( )`
- `const int getLongitude ( )`
- `const int getLatitude ( )`

### 5.4.1.2.1 Constructors and Destructors

5.4.1.2.1.1 `telux::tel::CdmaCellIdentity::CdmaCellIdentity ( int networkId, int systemId, int baseStationId, int longitude, int latitude )`

### 5.4.1.2.2 Member Function Documentation

5.4.1.2.2.1 `const int telux::tel::CdmaCellIdentity::getNid ( )`

Get the network identifier.

#### Returns

Network identifier.

5.4.1.2.2.2 `const int telux::tel::CdmaCellIdentity::getSid ( )`

Get the system identifier.

#### Returns

System identifier.

5.4.1.2.2.3 `const int telux::tel::CdmaCellIdentity::getBaseStationId ( )`

Get the base station identifier.

#### Returns

Base station identifier.

5.4.1.2.2.4 `const int telux::tel::CdmaCellIdentity::getLongitude ( )`

Get the longitude.

#### Returns

Longitude.

5.4.1.2.2.5 `const int telux::tel::CdmaCellIdentity::getLatitude ( )`

Get the latitude.

#### Returns

Latitude.

### 5.4.1.3 class telux::tel::LteCellIdentity

[LteCellIdentity](#) class provides methods to get the mobile country code, mobile network code, cell identity, physical cell identifier, tracking area code and absolute Rf channel number.

#### Public member functions

- [LteCellIdentity](#) (int mcc, int mnc, int ci, int pci, int tac, int earfcn)
- const int [getMcc](#) ()
- const int [getMnc](#) ()
- const int [getIdentity](#) ()
- const int [getPhysicalCellId](#) ()
- const int [getTrackingAreaCode](#) ()
- const int [getEarfcn](#) ()

#### 5.4.1.3.1 Constructors and Destructors

5.4.1.3.1.1 `telux::tel::LteCellIdentity::LteCellIdentity ( int mcc, int mnc, int ci, int pci, int tac, int earfcn )`

#### 5.4.1.3.2 Member Function Documentation

5.4.1.3.2.1 `const int telux::tel::LteCellIdentity::getMcc ( )`

Get the Mobile Country Code.

#### Returns

Mcc value.

5.4.1.3.2.2 `const int telux::tel::LteCellIdentity::getMnc ( )`

Get the Mobile Network Code.

#### Returns

Mnc value.

5.4.1.3.2.3 `const int telux::tel::LteCellIdentity::getIdentity ( )`

Get the cell identity.

#### Returns

Cell identity.

#### 5.4.1.3.2.4 `const int telux::tel::LteCellIdentity::getPhysicalCellId ( )`

Get the physical cell identifier.

##### Returns

Physical cell identifier.

#### 5.4.1.3.2.5 `const int telux::tel::LteCellIdentity::getTrackingAreaCode ( )`

Get the tracking area code.

##### Returns

Tracking area code.

#### 5.4.1.3.2.6 `const int telux::tel::LteCellIdentity::getEarfcn ( )`

Get the absolute RF channel number.

##### Returns

Absolute RF channel number.

### 5.4.1.4 `class telux::tel::WcdmaCellIdentity`

[WcdmaCellIdentity](#) class provides methods to get the mobile country code, mobile network code, location area code, cell identifier, primary scrambling code and absolute RF channel number.

#### Public member functions

- [WcdmaCellIdentity](#) (int *mcc*, int *mnc*, int *lac*, int *cid*, int *psc*, int *uarfcn*)
- `const int getMcc ( )`
- `const int getMnc ( )`
- `const int getLac ( )`
- `const int getIdentity ( )`
- `const int getPrimaryScramblingCode ( )`
- `const int getUarfcn ( )`

#### 5.4.1.4.1 Constructors and Destructors

5.4.1.4.1.1 `telux::tel::WcdmaCellIdentity::WcdmaCellIdentity ( int mcc, int mnc, int lac, int cid, int psc, int uarfcn )`

#### 5.4.1.4.2 Member Function Documentation

##### 5.4.1.4.2.1 `const int telux::tel::WcdmaCellIdentity::getMcc ( )`

Get the Mobile Country Code.

##### **Returns**

Mcc value.

##### 5.4.1.4.2.2 `const int telux::tel::WcdmaCellIdentity::getMnc ( )`

Get the Mobile Network Code.

##### **Returns**

Mnc value.

##### 5.4.1.4.2.3 `const int telux::tel::WcdmaCellIdentity::getLac ( )`

Get the location area code.

##### **Returns**

Location area code.

##### 5.4.1.4.2.4 `const int telux::tel::WcdmaCellIdentity::getIdentity ( )`

Get the cell identity.

##### **Returns**

Cell identity.

##### 5.4.1.4.2.5 `const int telux::tel::WcdmaCellIdentity::getPrimaryScramblingCode ( )`

Get the primary scrambling code.

##### **Returns**

Primary scrambling code.

##### 5.4.1.4.2.6 `const int telux::tel::WcdmaCellIdentity::getUarfcn ( )`

Get the absolute RF channel number.

##### **Returns**

Absolute RF channel number.

### 5.4.1.5 class telux::tel::TdscdmaCellIdentity

[TdscdmaCellIdentity](#) class provides methods to get the mobile country code, mobile network code, location area code, cell identity and cell parameters identifier.

#### Public member functions

- [TdscdmaCellIdentity](#) (int mcc, int mnc, int lac, int cid, int cpid)
- const int [getMcc](#) ()
- const int [getMnc](#) ()
- const int [getLac](#) ()
- const int [getIdentity](#) ()
- const int [getParametersId](#) ()

#### 5.4.1.5.1 Constructors and Destructors

5.4.1.5.1.1 `telux::tel::TdscdmaCellIdentity::TdscdmaCellIdentity ( int mcc, int mnc, int lac, int cid, int cpid )`

#### 5.4.1.5.2 Member Function Documentation

5.4.1.5.2.1 `const int telux::tel::TdscdmaCellIdentity::getMcc ( )`

Get the Mobile Country Code.

#### Returns

Mcc value.

5.4.1.5.2.2 `const int telux::tel::TdscdmaCellIdentity::getMnc ( )`

Get the Mobile Network Code.

#### Returns

Mnc value.

5.4.1.5.2.3 `const int telux::tel::TdscdmaCellIdentity::getLac ( )`

Get the location area code

#### Returns

Location area code.

#### 5.4.1.5.2.4 `const int telux::tel::TdscdmaCellIdentity::getIdentity ( )`

Get the cell identity.

##### Returns

Cell identity.

#### 5.4.1.5.2.5 `const int telux::tel::TdscdmaCellIdentity::getParametersId ( )`

Get the cell parameters identifier.

##### Returns

Cell parameters identifier.

### 5.4.1.6 `class telux::tel::Nr5gCellIdentity`

[Nr5gCellIdentity](#) class provides methods to get the mobile country code, mobile network code, cell identity, physical cell identifier, tracking area code and absolute RF channel number information of the Serving cell

#### Public member functions

- [Nr5gCellIdentity](#) (std::string mcc, std::string mnc, uint64\_t ci, uint32\_t pci, int32\_t tac, int32\_t arfcn)
- const std::string [getMobileCountryCode](#) ()
- const std::string [getMobileNetworkCode](#) ()
- const uint64\_t [getIdentity](#) ()
- const uint32\_t [getPhysicalCellId](#) ()
- const int32\_t [getTrackingAreaCode](#) ()
- const int32\_t [getArfcn](#) ()

#### 5.4.1.6.1 Constructors and Destructors

5.4.1.6.1.1 `telux::tel::Nr5gCellIdentity::Nr5gCellIdentity ( std::string mcc, std::string mnc, uint64_t ci, uint32_t pci, int32_t tac, int32_t arfcn )`

#### 5.4.1.6.2 Member Function Documentation

5.4.1.6.2.1 `const std::string telux::tel::Nr5gCellIdentity::getMobileCountryCode ( )`

Get the Mobile Country Code.

##### Returns

Mcc value.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.4.1.6.2.2 const std::string telux::tel::Nr5gCellIdentity::getMobileNetworkCode ( )**

Get the Mobile Network Code.

**Returns**

Mnc value.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.4.1.6.2.3 const uint64\_t telux::tel::Nr5gCellIdentity::getIdentity ( )**

Get the cell identity.

**Returns**

Cell identity.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.4.1.6.2.4 const uint32\_t telux::tel::Nr5gCellIdentity::getPhysicalCellId ( )**

Get the physical cell identifier.

**Returns**

Physical cell identifier.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.4.1.6.2.5 `const int32_t telux::tel::Nr5gCellIdentity::getTrackingAreaCode ( )`

Get the tracking area code.

##### Returns

Tracking area code.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.4.1.6.2.6 `const int32_t telux::tel::Nr5gCellIdentity::getArfcn ( )`

Get the absolute RF channel number.

##### Returns

Absolute RF channel number. '-1' denotes that the value is unknown.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.4.1.7 `class telux::tel::CellInfo`

[CellInfo](#) class provides cell info type and checks whether the current cell is registered or not.

#### Public member functions

- virtual [CellType](#) `getType ( )`
- virtual bool `isRegistered ( )`

#### Protected Attributes

- [CellType](#) `type_`
- int `registered_`

#### 5.4.1.7.1 Member Function Documentation

##### 5.4.1.7.1.1 `virtual CellType telux::tel::CellInfo::getType ( ) [virtual]`

Get the cell type.

##### Returns

CellType.

#### 5.4.1.7.1.2 virtual bool telux::tel::CellInfo::isRegistered ( ) [virtual]

Checks whether the current cell is registered or not.

#### Returns

If true cell is registered or vice-versa.

#### 5.4.1.7.2 Field Documentation

##### 5.4.1.7.2.1 CellType telux::tel::CellInfo::type\_ [protected]

##### 5.4.1.7.2.2 int telux::tel::CellInfo::registered\_ [protected]

#### 5.4.1.8 class telux::tel::GsmCellInfo

[GsmCellInfo](#) class provides methods to get cell type, cell registration status, cell identity and signal strength information.

#### Public member functions

- [GsmCellInfo](#) (int registered, [GsmCellIdentity](#) id, [GsmSignalStrengthInfo](#) ssInfo)
- [GsmCellIdentity](#) getCellIdentity ( )
- [GsmSignalStrengthInfo](#) getSignalStrengthInfo ( )

#### Additional Inherited Members

#### 5.4.1.8.1 Constructors and Destructors

##### 5.4.1.8.1.1 telux::tel::GsmCellInfo::GsmCellInfo ( int *registered*, [GsmCellIdentity](#) *id*, [GsmSignalStrengthInfo](#) *ssInfo* )

[GsmCellInfo](#) constructor.

#### Parameters

in	<i>registered</i>	- Registration status of the cell.
in	<i>id</i>	- GSM cell identity.
in	<i>ssInfo</i>	- GSM cell signal strength.

#### 5.4.1.8.2 Member Function Documentation

##### 5.4.1.8.2.1 [GsmCellIdentity](#) telux::tel::GsmCellInfo::getCellIdentity ( )

Get GSM cell identity information.

#### Returns

[GsmCellIdentity](#).

#### 5.4.1.8.2.2 `GsmSignalStrengthInfo` `telux::tel::GsmCellInfo::getSignalStrengthInfo ( )`

Get GSM cell signal strength information.

#### Returns

[GsmSignalStrengthInfo](#).

#### 5.4.1.9 class `telux::tel::CdmaCellInfo`

`CdmaCellInfo` class provides methods to get cell type, cell registration status, cell identity and signal strength information.

#### Public member functions

- [CdmaCellInfo](#) (int *registered*, [CdmaCellIdentity](#) *id*, [CdmaSignalStrengthInfo](#) *ssInfo*)
- [CdmaCellIdentity](#) `getCellIdentity ( )`
- [CdmaSignalStrengthInfo](#) `getSignalStrengthInfo ( )`

#### Additional Inherited Members

##### 5.4.1.9.1 Constructors and Destructors

##### 5.4.1.9.1.1 `telux::tel::CdmaCellInfo::CdmaCellInfo ( int registered, CdmaCellIdentity id, CdmaSignalStrengthInfo ssInfo )`

[CdmaCellInfo](#) constructor

#### Parameters

in	<i>registered</i>	- Registration status of the cell.
in	<i>id</i>	- CDMA cell identity.
in	<i>ssInfo</i>	- CDMA cell signal strength.

##### 5.4.1.9.2 Member Function Documentation

##### 5.4.1.9.2.1 `CdmaCellIdentity` `telux::tel::CdmaCellInfo::getCellIdentity ( )`

Get CDMA cell identity information.

#### Returns

[CdmaCellIdentity](#).

#### 5.4.1.9.2.2 CdmaSignalStrengthInfo telux::tel::CdmaCellInfo::getSignalStrengthInfo ( )

Get CDMA cell signal strength information.

#### Returns

[CdmaSignalStrengthInfo](#).

#### 5.4.1.10 class telux::tel::LteCellInfo

[LteCellInfo](#) class provides methods to get cell type, cell registration status, cell identity and signal strength information.

#### Public member functions

- [LteCellInfo](#) (int registered, [LteCellIdentity](#) id, [LteSignalStrengthInfo](#) ssInfo)
- [LteCellIdentity](#) getCellIdentity ()
- [LteSignalStrengthInfo](#) getSignalStrengthInfo ()

#### Additional Inherited Members

#### 5.4.1.10.1 Constructors and Destructors

##### 5.4.1.10.1.1 telux::tel::LteCellInfo::LteCellInfo ( int *registered*, [LteCellIdentity](#) *id*, [LteSignalStrengthInfo](#) *ssInfo* )

[LteCellInfo](#) constructor.

#### Parameters

in	<i>registered</i>	- Registration status of the cell.
in	<i>id</i>	- LTE cell identity class.
in	<i>ssInfo</i>	- LTE cell signal strength.

#### 5.4.1.10.2 Member Function Documentation

##### 5.4.1.10.2.1 LteCellIdentity telux::tel::LteCellInfo::getCellIdentity ( )

Get LTE cell identity information.

#### Returns

[LteCellIdentity](#).

#### 5.4.1.10.2.2 LteSignalStrengthInfo telux::tel::LteCellInfo::getSignalStrengthInfo ( )

Get LTE cell signal strength information.

#### Returns

[LteSignalStrengthInfo](#).

#### 5.4.1.11 class telux::tel::WcdmaCellInfo

[WcdmaCellInfo](#) class provides methods to get cell type, cell registration status, cell identity and signal strength information.

#### Public member functions

- [WcdmaCellInfo](#) (int registered, [WcdmaCellIdentity](#) id, [WcdmaSignalStrengthInfo](#) ssInfo)
- [WcdmaCellIdentity](#) getCellIdentity ()
- [WcdmaSignalStrengthInfo](#) getSignalStrengthInfo ()

#### Additional Inherited Members

#### 5.4.1.11.1 Constructors and Destructors

##### 5.4.1.11.1.1 telux::tel::WcdmaCellInfo::WcdmaCellInfo ( int *registered*, [WcdmaCellIdentity](#) *id*, [WcdmaSignalStrengthInfo](#) *ssInfo* )

[WcdmaCellInfo](#) constructor.

#### Parameters

in	<i>registered</i>	- Registration status of the cell.
in	<i>id</i>	- WCDMA cell identity.
in	<i>ssInfo</i>	- WCDMA cell signal strength.

#### 5.4.1.11.2 Member Function Documentation

##### 5.4.1.11.2.1 WcdmaCellIdentity telux::tel::WcdmaCellInfo::getCellIdentity ( )

Get WCDMA cell identity information.

#### Returns

[WcdmaCellIdentity](#).

#### 5.4.1.11.2.2 WcdmaSignalStrengthInfo telux::tel::WcdmaCellInfo::getSignalStrengthInfo ( )

Get WCDMA cell signal strength information.

#### Returns

[WcdmaSignalStrengthInfo](#).

#### 5.4.1.12 class telux::tel::TdscdmaCellInfo

[TdscdmaCellInfo](#) class provides methods to get cell type, cell registration status, cell identity and signal strength information.

#### Public member functions

- [TdscdmaCellInfo](#) (int registered, [TdscdmaCellIdentity](#) id, [TdscdmaSignalStrengthInfo](#) ssInfo)
- [TdscdmaCellIdentity](#) getCellIdentity ()
- [TdscdmaSignalStrengthInfo](#) getSignalStrengthInfo ()

#### Additional Inherited Members

#### 5.4.1.12.1 Constructors and Destructors

##### 5.4.1.12.1.1 telux::tel::TdscdmaCellInfo::TdscdmaCellInfo ( int *registered*, [TdscdmaCellIdentity](#) *id*, [TdscdmaSignalStrengthInfo](#) *ssInfo* )

[TdscdmaCellInfo](#) constructor.

#### Parameters

in	<i>registered</i>	- Registration status of the cell
in	<i>id</i>	- TDSCDMA cell identity.
in	<i>ssInfo</i>	- TDSCDMA cell signal strength.

#### 5.4.1.12.2 Member Function Documentation

##### 5.4.1.12.2.1 TdscdmaCellIdentity telux::tel::TdscdmaCellInfo::getCellIdentity ( )

Get TDSCDMA cell identity information.

#### Returns

[TdscdmaCellIdentity](#).

#### 5.4.1.12.2.2 TdscdmaSignalStrengthInfo telux::tel::TdscdmaCellInfo::getSignalStrengthInfo ( )

Get TDSCDMA cell signal strength information.

##### Returns

[TdscdmaSignalStrengthInfo](#).

#### 5.4.1.13 class telux::tel::Nr5gCellInfo

[Nr5gCellInfo](#) class provides methods to get cell type, cell registration status, cell identity and signal strength information corresponding to the Serving cell.

##### Public member functions

- [Nr5gCellInfo](#) (int registered, [Nr5gCellIdentity](#) id, [Nr5gSignalStrengthInfo](#) ssInfo)
- [Nr5gCellIdentity](#) getCellIdentity ()
- [Nr5gSignalStrengthInfo](#) getSignalStrengthInfo ()

##### Additional Inherited Members

#### 5.4.1.13.1 Constructors and Destructors

5.4.1.13.1.1 [telux::tel::Nr5gCellInfo::Nr5gCellInfo](#) ( int *registered*, [Nr5gCellIdentity](#) *id*, [Nr5gSignalStrengthInfo](#) *ssInfo* )

#### 5.4.1.13.2 Member Function Documentation

5.4.1.13.2.1 [Nr5gCellIdentity](#) [telux::tel::Nr5gCellInfo::getCellIdentity](#) ( )

Get NR5G cell identity information.

##### Returns

[Nr5gCellIdentity](#).

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

5.4.1.13.2.2 [Nr5gSignalStrengthInfo](#) [telux::tel::Nr5gCellInfo::getSignalStrengthInfo](#) ( )

Get NR5G cell signal strength information.

##### Returns

[Nr5gSignalStrengthInfo](#).

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.4.1.14 struct telux::tel::ECallMsdOptionals**

Represents MsdOptionals class as per European eCall MSD standard. i.e. EN 15722.

**Data fields**

Type	Field	Description
<a href="#">ECall↔ OptionalData↔ Type</a>	optionalData↔ Type	Type of optional data
bool	optionalData↔ Present	Availability of Optional data: true - Present or false - Absent
bool	recentVehicle↔ LocationN1↔ Present	Availability of Recent Vehicle Location N1 data: true - Present or false - Absent
bool	recentVehicle↔ LocationN2↔ Present	Availability of Recent Vehicle Location N2 data: true - Present or false - Absent
bool	numberOf↔ Passengers↔ Present	Availability of number of seat belts fastened data: true - Present or false - Absent

**5.4.1.15 struct telux::tel::ECallMsdControlBits**

Represents [ECallMsdControlBits](#) structure as per European eCall MSD standard. i.e. EN 15722.

**Data fields**

Type	Field	Description
bool	automatic↔ Activation	auto / manual activation
bool	testCall	test / emergency call
bool	positionCan↔ BeTrusted	false if coincidence < 95% of reported pos within +/- 150m
<a href="#">ECallVehicle↔ Type</a>	vehicleType: 5	Represents a vehicle class as per EN 15722

**5.4.1.16 struct telux::tel::ECallVehicleIdentificationNumber**

Represents VehicleIdentificationNumber structure as per European eCall MSD standard. i.e. EN 15722. Vehicle Identification Number confirming ISO3779.

**Data fields**

Type	Field	Description
string	isowmi	World Manufacturer Index (WMI)
string	isovds	Vehicle Type Descriptor (VDS)
string	isovis↔ Modelyear	Model year from Vehicle Identifier Section (VIS)
string	isovisSeqPlant	Plant code + sequential number from VIS

**5.4.1.17 struct telux::tel::ECallVehiclePropulsionStorageType**

Represents VehiclePropulsionStorageType structure as per European eCall MSD standard. i.e. EN 15722. Vehicle Propulsion type (energy storage): True- Present, False - Absent

**Data fields**

Type	Field	Description
bool	gasolineTank↔ Present	Represents the presence of Gasoline Tank in the vehicle.
bool	dieselTank↔ Present	Represents the presence of Diesel Tank in the vehicle
bool	compressed↔ NaturalGas	Represents the presence of CNG in the vehicle
bool	liquid↔ PropaneGas	Represents the presence of Liquid Propane Gas in the vehicle
bool	electric↔ EnergyStorage	Represents the presence of Electronic Storage in the vehicle
bool	hydrogen↔ Storage	Represents the presence of Hydrogen Storage in the vehicle
bool	otherStorage	Represents the presence of Other types of storage in the vehicle

**5.4.1.18 struct telux::tel::ECallVehicleLocation**

Represents VehicleLocation structure as per European eCall MSD standard. i.e. EN 15722.

**Data fields**

Type	Field	Description
int32_t	position↔ Latitude	latitude in value range (-2147483648 to 2147483647)
int32_t	position↔ Longitude	

**5.4.1.19 struct telux::tel::ECallVehicleLocationDelta**

Represents VehicleLocationDelta structure as per European eCall MSD standard. i.e. EN 15722. Delta with respect to Current Vehicle location.

**Data fields**

Type	Field	Description
int16_t	latitudeDelta	( 1 Unit = 100 milliarcseconds, range: -512 to 511)
int16_t	longitudeDelta	( 1 Unit = 100 milliarcseconds, range: -512 to 511)

**5.4.1.20 struct telux::tel::ECallOptionalPdu**

Optional information for the emergency rescue service.

**Data fields**

Type	Field	Description
ECallDefault↔ Options	eCallDefault↔ Options	Optional information

**5.4.1.21 struct telux::tel::ECallMsdData**

Data structure to hold all details required to construct an MSD

**Data fields**

Type	Field	Description
ECallMsd↔ Optionals	optionals	Indicates presence of optionals in ECall MSD
uint8_t	message↔ Identifier	Starts with 1 for each new , increment on retransmission
ECallMsd↔ ControlBits	control	ECallMsdControlBits structure as per European standard i.e. EN 15722
ECallVehicle↔ Identification↔ Number	vehicle↔ Identification↔ Number	VIN (vehicle identification number) according to ISO3779
ECallVehicle↔ Propulsion↔ StorageType	vehicle↔ Propulsion↔ Storage	VehiclePropulsionStorageType structure as per European standard i.e. EN 15722
uint32_t	timestamp	Seconds elapsed since midnight 01.01.1970 UTC
ECallVehicle↔ Location	vehicleLocation	VehicleLocation structure as per European standard. i.e. EN 15722
uint8_t	vehicle↔ Direction	Direction of travel in 2 degrees steps from magnetic north
ECallVehicle↔ LocationDelta	recentVehicle↔ LocationN1	Change in latitude and longitude compared to the last MSD transmission
ECallVehicle↔ LocationDelta	recentVehicle↔ LocationN2	Change in latitude and longitude compared to the last but one MSD transmission
uint8_t	numberOf↔ Passengers	Number of occupants in the vehicle

Type	Field	Description
<a href="#">ECall</a> ↔ <a href="#">OptionalPdu</a>	optionalPdu	Optional information for the emergency rescue service (103 bytes, ASN.1 encoded); may also point to an address, where this information is locatedOptional information for the emergency rescue service

#### 5.4.1.22 struct telux::tel::ECallModelInfo

Represents eCall operating mode information

##### Data fields

Type	Field	Description
<a href="#">ECallMode</a>	mode	Represents eCall operating mode
<a href="#">ECallMode</a> ↔ <a href="#">Reason</a>	reason	Represents eCall operating mode change reason

#### 5.4.1.23 struct telux::tel::ECallHlapTimerStatus

Represents status of various eCall High Level Application Protocol(HLAP) timers that are maintained by UE state machine. This does not retrieve status of timers maintained by the PSAP. The timers are represented according to EN 16062:2015 standard.

##### Data fields

Type	Field	Description
<a href="#">HlapTimer</a> ↔ <a href="#">Status</a>	t2	T2 Timer status
<a href="#">HlapTimer</a> ↔ <a href="#">Status</a>	t5	T5 Timer status
<a href="#">HlapTimer</a> ↔ <a href="#">Status</a>	t6	T6 Timer status
<a href="#">HlapTimer</a> ↔ <a href="#">Status</a>	t7	T7 Timer status
<a href="#">HlapTimer</a> ↔ <a href="#">Status</a>	t9	T9 Timer status
<a href="#">HlapTimer</a> ↔ <a href="#">Status</a>	t10	T10 Timer status

#### 5.4.1.24 struct telux::tel::ECallHlapTimerEvents

Represents events that changes the status of various eCall High Level Application Protocol(HLAP) timers that are maintained by UE state machine. This does not retrieve events of timers maintained by the PSAP. The timers are represented according to EN 16062:2015 standard.

**Data fields**

Type	Field	Description
<a href="#">HlapTimer↔ Event</a>	t2	T2 Timer event
<a href="#">HlapTimer↔ Event</a>	t5	T5 Timer event
<a href="#">HlapTimer↔ Event</a>	t6	T6 Timer event
<a href="#">HlapTimer↔ Event</a>	t7	T7 Timer event
<a href="#">HlapTimer↔ Event</a>	t9	T9 Timer event
<a href="#">HlapTimer↔ Event</a>	t10	T10 Timer event

**5.4.1.25 struct telux::tel::EcallConfig**

Represents various configuration parameters related to automotive emergency call

**Data fields**

Type	Field	Description
<a href="#">EcallConfig↔ Validity</a>	config↔ ValidityMask	Indicates the valid configuration parameters in the structure. A bit set to 1 denotes that the corresponding configuration parameter is valid
bool	muteRxAudio	
<a href="#">ECallNumType</a>	numType	
string	overriddenNum	
bool	useCannedMsd	
uint32_t	gnssUpdate↔ Interval	
uint32_t	t2Timer	
uint32_t	t7Timer	
uint32_t	t9Timer	
uint8_t	msdVersion	

**5.4.1.26 class telux::tel::IPhone**

This class allows getting system information and registering for system events. Each Phone instance is associated with a single SIM. So on a dual SIM device you would have 2 Phone instances.

**Public member functions**

- virtual [telux::common::Status](#) getPhoneId (int &phId)=0
- virtual [RadioState](#) getRadioState ()=0
- virtual [telux::common::Status](#) requestVoiceRadioTechnology ([VoiceRadioTechResponseCb](#) callback)=0

- virtual [ServiceState](#) getServiceState ()=0
- virtual [telux::common::Status](#) requestVoiceServiceState (std::weak\_ptr< [IVoiceServiceStateCallback](#) > callback)=0
- virtual [telux::common::Status](#) setRadioPower (bool enable, std::shared\_ptr< [telux::common::ICommandResponseCallback](#) > callback=nullptr)=0
- virtual [telux::common::Status](#) requestCellInfo ([CellInfoCallback](#) callback)=0
- virtual [telux::common::Status](#) setCellInfoListRate (uint32\_t timeInterval, [common::ResponseCallback](#) callback)=0
- virtual [telux::common::Status](#) requestSignalStrength (std::shared\_ptr< [ISignalStrengthCallback](#) > callback=nullptr)=0
- virtual [telux::common::Status](#) setECallOperatingMode ([ECallMode](#) eCallMode, [telux::common::ResponseCallback](#) callback)=0
- virtual [telux::common::Status](#) requestECallOperatingMode ([ECallGetOperatingModeCallback](#) callback)=0
- virtual [~IPhone](#) ()

#### 5.4.1.26.1 Constructors and Destructors

5.4.1.26.1.1 virtual [telux::tel::IPhone::~IPhone](#) ( ) [[virtual](#)]

#### 5.4.1.26.2 Member Function Documentation

5.4.1.26.2.1 virtual [telux::common::Status](#) [telux::tel::IPhone::getPhoneId](#) ( int & *phId* ) [[pure virtual](#)]

Get the Phone ID corresponding to phone.

##### Parameters

out	<i>phoneId</i>	Unique identifier for the phone
-----	----------------	---------------------------------

##### Returns

Status of [getPhoneId](#) i.e. success or suitable error code.

5.4.1.26.2.2 virtual [RadioState](#) [telux::tel::IPhone::getRadioState](#) ( ) [[pure virtual](#)]

Get Radio state of device.

##### Returns

[RadioState](#)

**Deprecated** Use `IPhoneManager::requestOperatingMode()` API instead

**5.4.1.26.2.3** `virtual telux::common::Status telux::tel::IPhone::requestVoiceRadioTechnology ( VoiceRadioTechResponseCb callback ) [pure virtual]`

Request for Radio technology type (3GPP/3GPP2) used for voice.

#### Parameters

in	<i>callback</i>	callback pointer to get the response of radio power request <a href="#">telux::tel::VoiceRadioTechResponseCb</a>
----	-----------------	--

#### Returns

Status of `requestVoiceRadioTechnology` i.e. success or suitable error code [telux::common::Status](#).

**Deprecated** Use `requestVoiceServiceState()` API to get [VoiceServiceInfo](#) which has API to get radio technology i.e [VoiceServiceInfo::getRadioTechnology\(\)](#)

**5.4.1.26.2.4** `virtual ServiceState telux::tel::IPhone::getServiceState ( ) [pure virtual]`

Get service state of the phone.

#### Returns

[ServiceState](#)

**Deprecated** Use `requestVoiceServiceState()` API

**5.4.1.26.2.5** `virtual telux::common::Status telux::tel::IPhone::requestVoiceServiceState ( std::weak_ptr< IVoiceServiceStateCallback > callback ) [pure virtual]`

Request for voice service state to get the information of phone serving states

#### Parameters

in	<i>callback</i>	callback pointer to get the response of voice service state <a href="#">telux::tel::IVoiceServiceStateCallback</a> .
----	-----------------	--

#### Returns

Status of `requestVoiceServiceState` i.e. success or suitable error code [telux::common::Status](#).

**5.4.1.26.2.6** `virtual telux::common::Status telux::tel::IPhone::setRadioPower ( bool enable, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Set the radio power on or off.

#### Parameters

in	<i>enable</i>	Flag that determines whether to turn radio on or off
in	<i>callback</i>	Optional callback pointer to get the response of set radio power request

#### Returns

Status of setRadioPower i.e. success or suitable error code.

**Deprecated** Use `IPhoneManager::setOperatingMode()` API instead

**5.4.1.26.2.7** `virtual telux::common::Status telux::tel::IPhone::requestCellInfo ( CellInfoCallback callback ) [pure virtual]`

Get the cell information about current serving cell and neighboring cells.

#### Parameters

in	<i>callback</i>	Callback to get the response of cell info request <a href="#">tel::CellInfoCallback</a>
----	-----------------	--

#### Returns

Status of requestCellInfo i.e. success or suitable error

**5.4.1.26.2.8** `virtual telux::common::Status telux::tel::IPhone::setCellInfoListRate ( uint32_t timeInterval, common::ResponseCallback callback ) [pure virtual]`

Set the minimum time in milliseconds between when the cell info list should be received.

#### Parameters

in	<i>timeInterval</i>	Value of 0 means receive cell info list when any info changes. Value of INT_MAX means never receive cell info list even on change. Default value is 0
in	<i>callback</i>	Callback to get the response for set cell info list rate.

#### Returns

Status of setCellInfoListRate i.e. success or suitable error

#### 5.4.1.26.2.9 virtual telux::common::Status telux::tel::IPhone::requestSignalStrength ( std::shared\_ptr< ISignalStrengthCallback > *callback* = nullptr ) [pure virtual]

Get current signal strength of the associated network.

##### Parameters

in	<i>callback</i>	Optional callback pointer to get the response of signal strength request
----	-----------------	--

##### Returns

Status of requestSignalStrength i.e. success or suitable error code.

#### 5.4.1.26.2.10 virtual telux::common::Status telux::tel::IPhone::setECallOperatingMode ( ECallMode *eCallMode*, telux::common::ResponseCallback *callback* ) [pure virtual]

Sets the eCall operating mode

##### Parameters

in	<i>eCallMode</i>	- <a href="#">ECallMode</a>
in	<i>callback</i>	- Callback function to get the response for set eCall operating mode request.

##### Returns

Status of setECallOperatingMode i.e. success or suitable error

#### 5.4.1.26.2.11 virtual telux::common::Status telux::tel::IPhone::requestECallOperatingMode ( ECallGetOperatingModeCallback *callback* ) [pure virtual]

Get the eCall operating mode

##### Parameters

in	<i>callback</i>	- Callback function to get the response of eCall operating mode request
----	-----------------	---

##### Returns

Status of requestECallOperatingMode i.e. success or suitable error

### 5.4.1.27 class telux::tel::ISignalStrengthCallback

Interface for Signal strength callback object. Client needs to implement this interface to get single shot responses for commands like get signal strength.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [signalStrengthResponse](#) (std::shared\_ptr< [SignalStrength](#) > signalStrength, [telux::common::ErrorCode](#) error)
- virtual [~ISignalStrengthCallback](#) ()

#### 5.4.1.27.1 Constructors and Destructors

5.4.1.27.1.1 virtual [telux::tel::ISignalStrengthCallback::~~ISignalStrengthCallback](#) ( ) [virtual]

#### 5.4.1.27.2 Member Function Documentation

5.4.1.27.2.1 virtual void [telux::tel::ISignalStrengthCallback::signalStrengthResponse](#) ( std↔  
::shared\_ptr< [SignalStrength](#) > *signalStrength*, [telux::common::ErrorCode](#) *error* )  
[virtual]

This function is called with the response to requestSignalStrength API.

#### Parameters

in	<i>signalStrength</i>	Pointer to signal strength object
in	<i>error</i>	Return code for whether the operation succeeded or failed <a href="#">SUCCESS</a> <a href="#">RADIO_NOT_AVAILABLE</a>

### 5.4.1.28 class telux::tel::IVoiceServiceStateCallback

Interface for voice service state callback object. Client needs to implement this interface to get single shot responses for commands like request voice radio technology.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [voiceServiceStateResponse](#) (const std::shared\_ptr< [VoiceServiceInfo](#) > &serviceInfo, [telux::common::ErrorCode](#) error)
- virtual [~IVoiceServiceStateCallback](#) ()

### 5.4.1.28.1 Constructors and Destructors

5.4.1.28.1.1 `virtual telux::tel::IVoiceServiceStateCallback::~~IVoiceServiceStateCallback ( )`  
[virtual]

### 5.4.1.28.2 Member Function Documentation

5.4.1.28.2.1 `virtual void telux::tel::IVoiceServiceStateCallback::voiceServiceStateResponse ( const std::shared_ptr< VoiceServiceInfo > & serviceInfo, telux::common::ErrorCode error )`  
[virtual]

This function is called with the response to requestVoiceServiceState API.

#### Parameters

in	<i>serviceInfo</i>	Pointer to voice service info object <a href="#">telux::tel::VoiceServiceInfo</a>
in	<i>error</i>	Return code for whether the operation succeeded or failed <ul style="list-style-type: none"> <li><a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li><a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li><a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>

### 5.4.1.29 struct telux::tel::SimRatCapability

Structure contains slotID and RAT capabilities corresponding to slot.

#### Data fields

Type	Field	Description
int	slotId	
<a href="#">RAT↔</a> <a href="#">Capabilities↔</a> <a href="#">Mask</a>	capabilities	

### 5.4.1.30 struct telux::tel::CellularCapabilityInfo

Structure contains information about device capability.

#### Data fields

Type	Field	Description
<a href="#">VoiceService↔</a> <a href="#">Technologies↔</a> <a href="#">Mask</a>	voiceService↔ Techs	Indicates voice support capabilities
int	simCount	The maximum number of SIMs that can be supported simultaneously
int	maxActiveSims	The maximum number of SIMs that can be simultaneously active. If this number is less than numberOfSims, it implies that any combination of the SIMs can be active and the remaining can be in standby.

Type	Field	Description
vector< <a href="#">Sim↔ RatCapability</a> >	simRat↔ Capabilities	A Sim inserted in a slot allows for certain rat capabilities. And the UE's HW allows for certain rat capabilities. This field lists the intersection of capabilities allowed by the Sim and the HW. The capabilities are indexed based on slotId.
vector< <a href="#">DeviceRat↔ Capability</a> >	deviceRat↔ Capability	This field lists the Rat capabilities supported by the HW on a given Sim slot. The capabilities are indexed based on slotId.

### 5.4.1.31 class telux::tel::IPhoneListener

A listener class for monitoring changes in specific telephony states on the device, including service state and signal strength. Override the methods for the state that you wish to receive updates for.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onServiceStateChanged](#) (int phoneId, [ServiceState](#) state)
- virtual void [onSignalStrengthChanged](#) (int phoneId, std::shared\_ptr< [SignalStrength](#) > signalStrength)
- virtual void [onCellInfoListChanged](#) (int phoneId, std::vector< std::shared\_ptr< [CellInfo](#) >> cellInfoList)
- virtual void [onRadioStateChanged](#) (int phoneId, [RadioState](#) radioState)
- virtual void [onVoiceRadioTechnologyChanged](#) (int phoneId, [RadioTechnology](#) radioTech)
- virtual void [onVoiceServiceStateChanged](#) (int phoneId, const std::shared\_ptr< [VoiceServiceInfo](#) > &serviceInfo)
- virtual void [onOperatingModeChanged](#) ([OperatingMode](#) mode)
- virtual void [onECallOperatingModeChange](#) (int phoneId, [telux::tel::ECallModeInfo](#) info)
- virtual [~IPhoneListener](#) ()

#### 5.4.1.31.1 Constructors and Destructors

5.4.1.31.1.1 virtual telux::tel::IPhoneListener::~IPhoneListener ( ) [virtual]

#### 5.4.1.31.2 Member Function Documentation

5.4.1.31.2.1 virtual void telux::tel::IPhoneListener::onServiceStateChanged ( int *phoneId*, [ServiceState](#) *state* ) [virtual]

This function is called when device service state changes.

in	<i>phoneId</i>	Unique id of the phone on which service state changed.
in	<i>state</i>	Service state of the phone <a href="#">ServiceState</a>

**Deprecated** Use [onVoiceServiceStateChanged\(\)](#) listener

**5.4.1.31.2.2** `virtual void telux::tel::IPhoneListener::onSignalStrengthChanged ( int phoneId,  
std::shared_ptr< SignalStrength > signalStrength ) [virtual]`

This function is called when network signal strength changes.

#### Parameters

in	<i>phoneId</i>	Unique id of the phone on which signal strength state changed.
in	<i>signalStrength</i>	Pointer to signal strength object

**5.4.1.31.2.3** `virtual void telux::tel::IPhoneListener::onCellInfoListChanged ( int phoneId, std::vector<  
std::shared_ptr< CellInfo >> cellInfoList ) [virtual]`

This function is called when info pertaining to current or neighboring cells change.

#### Parameters

in	<i>phoneId</i>	Unique id of the phone on which cell info changed.
in	<i>cellInfoList</i>	vector of shared pointers to cell info object

**5.4.1.31.2.4** `virtual void telux::tel::IPhoneListener::onRadioStateChanged ( int phoneId, RadioState  
radioState ) [virtual]`

This function is called when radio state changes on phone

#### Parameters

in	<i>phone</i>	Unique id of the phone on which radio state changed
in	<i>radioState</i>	Radio state of the phone <a href="#">RadioState</a>

**Deprecated** Use [onOperatingModeChanged\(\)](#) API instead

**5.4.1.31.2.5** `virtual void telux::tel::IPhoneListener::onVoiceRadioTechnologyChanged ( int phoneId,  
RadioTechnology radioTech ) [virtual]`

This function is called when the radio technology for voice service changes

#### Parameters

in	<i>phone</i>	Unique id of the phone on which radio technology changed
in	<i>radioTech</i>	Radio state of the phone <a href="#">telux::tel::RadioTechnology</a>

**Deprecated** Use [onVoiceServiceStateChanged\(\)](#) API instead

**5.4.1.31.2.6** `virtual void telux::tel::IPhoneListener::onVoiceServiceStateChanged ( int phoneId, const std::shared_ptr< VoiceServiceInfo > & serviceInfo ) [virtual]`

This function is called when the service state for voice service changes

#### Parameters

in	<i>phone</i>	Unique id of the phone on which radio technology changed
in	<i>serviceInfo</i>	pointer of voice service state info object <a href="#">telux::tel::VoiceServiceInfo</a>

**5.4.1.31.2.7** `virtual void telux::tel::IPhoneListener::onOperatingModeChanged ( OperatingMode mode ) [virtual]`

This function is called when the operating mode changes

#### Parameters

in	<i>mode</i>	Operating mode <a href="#">OperatingMode</a> .
----	-------------	--

**5.4.1.31.2.8** `virtual void telux::tel::IPhoneListener::onECallOperatingModeChange ( int phoneId, telux::tel::ECallModeInfo info ) [virtual]`

This function is called when eCall operating mode changes.

#### Parameters

in	<i>phoneId</i>	- Unique Id of phone for which eCall operating mode changed
in	<i>info</i>	- Indicates eCall operating mode change reason <a href="#">ECallModeInfo</a>

### 5.4.1.32 class telux::tel::IPhoneManager

Phone Manager creates one or more phones based on SIM slot count, it allows clients to register for notification of system events. Clients should check if the subsystem is ready before invoking any of the APIs.

#### Public member functions

- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::Status getPhoneIds](#) (std::vector< int > &phoneIds)=0
- virtual int [getPhoneIdFromSlotId](#) (int slotId)=0
- virtual int [getSlotIdFromPhoneId](#) (int phoneId)=0

- virtual `std::shared_ptr< iPhone > getPhone (int phoneId=DEFAULT_PHONE_ID)=0`
- virtual `telux::common::Status requestCellularCapabilityInfo (std::shared_ptr< ICellularCapabilityCallback > callback=nullptr)=0`
- virtual `telux::common::Status requestOperatingMode (std::shared_ptr< IOperatingModeCallback > callback=nullptr)=0`
- virtual `telux::common::Status setOperatingMode (OperatingMode operatingMode, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< iPhoneListener > listener)=0`
- virtual `telux::common::Status removeListener (std::weak_ptr< iPhoneListener > listener)=0`
- virtual `~IPhoneManager ()`

### 5.4.1.32.1 Constructors and Destructors

5.4.1.32.1.1 `virtual telux::tel::IPhoneManager::~~IPhoneManager ( ) [virtual]`

### 5.4.1.32.2 Member Function Documentation

5.4.1.32.2.1 `virtual bool telux::tel::IPhoneManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of telephony subsystems and returns the result.

#### Returns

If true PhoneManager is ready for service (i.e Phone, Sms and Card).

5.4.1.32.2.2 `virtual std::future<bool> telux::tel::IPhoneManager::onSubsystemReady ( ) [pure virtual]`

Wait for telephony subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when telephony subsystem is ready.

5.4.1.32.2.3 `virtual telux::common::Status telux::tel::IPhoneManager::getPhoneIds ( std::vector< int > & phoneIds ) [pure virtual]`

Retrieves a list of Phone Ids. Each id is unique per phone. For example: on a dual SIM device, there would be 2 Phones.

#### Parameters

out	<i>phoneIds</i>	List of phone ids
-----	-----------------	-------------------

**Returns**

Status of getPhoneIds i.e. success or suitable error code.

**5.4.1.32.2.4** `virtual int telux::tel::IPhoneManager::getPhoneIdFromSlotId ( int slotId ) [pure virtual]`

Get the Phone Id for a given Slot Id.

**Parameters**

<i>in</i>	<i>slotId</i>	SIM Card Slot Id
-----------	---------------	------------------

**Returns**

Phone Id corresponding to the Slot Id.

**5.4.1.32.2.5** `virtual int telux::tel::IPhoneManager::getSlotIdFromPhoneId ( int phoneId ) [pure virtual]`

Get the SIM Slot Id for a given Phone Id.

**Parameters**

<i>in</i>	<i>phoneId</i>	Phone Id of the phone
-----------	----------------	-----------------------

**Returns**

Slot Id corresponding to the Phone Id.

**5.4.1.32.2.6** `virtual std::shared_ptr<IPhone> telux::tel::IPhoneManager::getPhone ( int phoneId = DEFAULT_PHONE_ID ) [pure virtual]`

Get the phone instance for a given phone identifier.

**Parameters**

<i>in</i>	<i>phoneId</i>	Identifier for phone instance, retrieved from getPhoneIds API
-----------	----------------	---

**Returns**

Pointer to Phone object corresponding to phoneId.

**5.4.1.32.2.7** `virtual telux::common::Status telux::tel::IPhoneManager::requestCellularCapabilityInfo ( std::shared_ptr<ICellularCapabilityCallback > callback = nullptr ) [pure virtual]`

Get the information about cellular capability.

in	<i>callback</i>	Optional callback pointer to get the response of cellular capability.
----	-----------------	---

**Returns**

Status of requestCellularCapabilityInfo i.e. success or suitable error code.

**5.4.1.32.2.8** virtual telux::common::Status telux::tel::IphoneManager::requestOperatingMode ( std::shared\_ptr< IOperatingModeCallback > *callback* = nullptr ) [pure virtual]

Get current operating mode of the device.

**Parameters**

in	<i>callback</i>	Optional callback pointer to get the response of operating mode request
----	-----------------	---

**Returns**

Status of requestOperatingMode i.e. success or suitable error code.

**5.4.1.32.2.9** virtual telux::common::Status telux::tel::IphoneManager::setOperatingMode ( OperatingMode *operatingMode*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]

Set the operating mode of the device. Only valid transitions allowed from one mode to another.

**Parameters**

in	<i>operatingMode</i>	Operating Mode to be set
in	<i>callback</i>	Optional callback pointer to get the response of set operatingmode request. In callback following error is returned. <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::INVALID_TRANSITION</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::DEVICE_IN_USE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> </ul>

**Returns**

Status of setOperatingMode i.e. success or suitable error code.

**5.4.1.32.2.10** virtual telux::common::Status telux::tel::IphoneManager::registerListener ( std::weak\_ptr< IphoneListener > *listener* ) [pure virtual]

Register a listener for specific events in the telephony subsystem.

in	<i>listener</i>	Pointer to Phone Listener object that processes the notification
----	-----------------	--

**Returns**

Status of registerListener i.e. success or suitable error code.

**5.4.1.32.2.11** `virtual telux::common::Status telux::tel::IphoneManager::removeListener ( std::weak_ptr< IPhoneListener > listener ) [pure virtual]`

Remove a previously added listener.

**Parameters**

in	<i>listener</i>	Pointer to Phone Listener object that needs to be removed
----	-----------------	---

**Returns**

Status of removeListener i.e. success or suitable error code.

**5.4.1.33 class telux::tel::ICellularCapabilityCallback**

Interface for callback corresponding to cellular capability request. Client needs to implement this interface to get single shot responses for commands like get cellular capability.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void `cellularCapabilityResponse ( CellularCapabilityInfo capabilityInfo, telux::common::ErrorCode error )`
- virtual `~ICellularCapabilityCallback ()`

**5.4.1.33.1 Constructors and Destructors**

**5.4.1.33.1.1** `virtual telux::tel::ICellularCapabilityCallback::~~ICellularCapabilityCallback ( ) [virtual]`

**5.4.1.33.2 Member Function Documentation**

**5.4.1.33.2.1** `virtual void telux::tel::ICellularCapabilityCallback::cellularCapabilityResponse ( CellularCapabilityInfo capabilityInfo, telux::common::ErrorCode error ) [virtual]`

This function is called with the response to requestCellularCapabilityInfo API.

**Parameters**

in	<i>capabilityInfo</i>	Cellular capability information.
in	<i>error</i>	Return code for whether the operation succeeded or failed <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> </ul>

**5.4.1.34 class telux::tel::IOperatingModeCallback**

Interface for operating mode callback object. Client needs to implement this interface to get single shot responses for commands like request current operating mode.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [operatingModeResponse](#) ([OperatingMode](#) operatingMode, [telux::common::ErrorCode](#) error)
- virtual [~IOperatingModeCallback](#) ()

**5.4.1.34.1 Constructors and Destructors**

**5.4.1.34.1.1** virtual [telux::tel::IOperatingModeCallback::~~IOperatingModeCallback](#) ( ) [[virtual](#)]

**5.4.1.34.2 Member Function Documentation**

**5.4.1.34.2.1** virtual void [telux::tel::IOperatingModeCallback::operatingModeResponse](#) ( [OperatingMode](#) *operatingMode*, [telux::common::ErrorCode](#) *error* ) [[virtual](#)]

This function is called with the response to requestOperatingMode API.

**Parameters**

in	<i>operatingMode</i>	<a href="#">OperatingMode</a>
in	<i>error</i>	Return code for whether the operation succeeded or failed <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> </ul>

**5.4.1.35 class telux::tel::SignalStrength**

[SignalStrength](#) class provides access to LTE, GSM, CDMA, WCDMA, TDSCDMA signal strengths.

## Public member functions

- [SignalStrength](#) (std::shared\_ptr< [LteSignalStrengthInfo](#) > lteSignalStrengthInfo, std::shared\_ptr< [GsmSignalStrengthInfo](#) > gsmSignalStrengthInfo, std::shared\_ptr< [CdmaSignalStrengthInfo](#) > cdmaSignalStrengthInfo, std::shared\_ptr< [WcdmaSignalStrengthInfo](#) > wcdmaSignalStrengthInfo, std::shared\_ptr< [TdscdmaSignalStrengthInfo](#) > tdscdmaSignalStrengthInfo, std::shared\_ptr< [Nr5gSignalStrengthInfo](#) > nr5gSignalStrengthInfo)
- std::shared\_ptr< [LteSignalStrengthInfo](#) > [getLteSignalStrength](#) ()
- std::shared\_ptr< [GsmSignalStrengthInfo](#) > [getGsmSignalStrength](#) ()
- std::shared\_ptr< [CdmaSignalStrengthInfo](#) > [getCdmaSignalStrength](#) ()
- std::shared\_ptr< [WcdmaSignalStrengthInfo](#) > [getWcdmaSignalStrength](#) ()
- std::shared\_ptr< [TdscdmaSignalStrengthInfo](#) > [getTdscdmaSignalStrength](#) ()
- std::shared\_ptr< [Nr5gSignalStrengthInfo](#) > [getNr5gSignalStrength](#) ()

### 5.4.1.35.1 Constructors and Destructors

**5.4.1.35.1.1** `telux::tel::SignalStrength::SignalStrength ( std::shared_ptr< LteSignalStrengthInfo > lteSignalStrengthInfo, std::shared_ptr< GsmSignalStrengthInfo > gsmSignalStrengthInfo, std::shared_ptr< CdmaSignalStrengthInfo > cdmaSignalStrengthInfo, std::shared_ptr< WcdmaSignalStrengthInfo > wcdmaSignalStrengthInfo, std::shared_ptr< TdscdmaSignalStrengthInfo > tdscdmaSignalStrengthInfo, std::shared_ptr< Nr5gSignalStrengthInfo > nr5gSignalStrengthInfo )`

### 5.4.1.35.2 Member Function Documentation

**5.4.1.35.2.1** `std::shared_ptr<LteSignalStrengthInfo> telux::tel::SignalStrength::getLteSignalStrength ( )`

Gives LTE signal strength instance.

#### Returns

Pointer to LTE signal strength instance that can be used to get lte dbm, signal level values.

**5.4.1.35.2.2** `std::shared_ptr<GsmSignalStrengthInfo> telux::tel::SignalStrength::getGsmSignalStrength ( )`

Gives GSM signal strength instance.

#### Returns

Pointer to GSM signal strength instance that can be used to get GSM dbm, signal level values.

#### 5.4.1.35.2.3 `std::shared_ptr<CdmaSignalStrengthInfo> telux::tel::SignalStrength::getCdmaSignalStrength ( )`

Gives CDMA signal strength instance.

##### Returns

Pointer to CDMA signal strength instance that can be used to get cdma/evdo dbm, signal level values.

#### 5.4.1.35.2.4 `std::shared_ptr<WcdmaSignalStrengthInfo> telux::tel::SignalStrength::getWcdmaSignalStrength ( )`

Gives WCDMA signal strength instance.

##### Returns

Pointer to WCDMA signal strength instance that can be used to get WCDMA dbm, signal level values.

#### 5.4.1.35.2.5 `std::shared_ptr<TdscdmaSignalStrengthInfo> telux::tel::SignalStrength::getTdscdmaSignalStrength ( )`

Gives TDSWCDMA signal strength instance.

##### Returns

Pointer to TDSWCDMA signal strength instance that can be used to get TDSCDMA RSCP value.

#### 5.4.1.35.2.6 `std::shared_ptr<Nr5gSignalStrengthInfo> telux::tel::SignalStrength::getNr5gSignalStrength ( )`

Gives 5G NR signal strength instance.

##### Returns

Pointer to 5G NR signal strength instance that can be used to get 5G NR dbm and snr values.

### 5.4.1.36 `class telux::tel::LteSignalStrengthInfo`

LTE signal strength class provides methods to get details of lte signals like dbm, signal level, reference signal-to-noise ratio, channel quality indicator and signal strength.

#### Public member functions

- [LteSignalStrengthInfo](#) (int lteSignalStrength, int lteRsrp, int lteRsrq, int lteRssnr, int lteCqi, int timingAdvance)
- const [SignalStrengthLevel](#) `getLevel ()` const
- const int `getDbm ()` const

- const int `getLteSignalStrength ()` const
- const int `getLteReferenceSignalReceiveQuality ()` const
- const int `getLteReferenceSignalSnr ()` const
- const int `getLteChannelQualityIndicator ()` const
- const int `getTimingAdvance ()` const

### 5.4.1.36.1 Constructors and Destructors

**5.4.1.36.1.1** `telux::tel::LteSignalStrengthInfo::LteSignalStrengthInfo ( int LteSignalStrength, int LteRsrp, int LteRsrq, int LteRssnr, int LteCqi, int timingAdvance )`

### 5.4.1.36.2 Member Function Documentation

**5.4.1.36.2.1** `const SignalStrengthLevel telux::tel::LteSignalStrengthInfo::getLevel ( )` const

Get signal level in the range.

#### Returns

Signal levels indicates the quality of signal being received by the device.

**5.4.1.36.2.2** `const int telux::tel::LteSignalStrengthInfo::getDbm ( )` const

Get the signal strength in dBm. (Valid value range [-140, -44] and `INVALID_SIGNAL_STRENGTH_VALUE` i.e. unavailable).

#### Returns

LTE dBm value.

**5.4.1.36.2.3** `const int telux::tel::LteSignalStrengthInfo::getLteSignalStrength ( )` const

Get the LTE signal strength. (Valid value range [0, 31] and `INVALID_SIGNAL_STRENGTH_VALUE` i.e. unavailable).

#### Returns

LTE signal strength.

**5.4.1.36.2.4** `const int telux::tel::LteSignalStrengthInfo::getLteReferenceSignalReceiveQuality ( )` const

Get LTE reference signal receive quality in dB. (Valid value range [-20, -3] and `INVALID_SIGNAL_STRENGTH_VALUE` i.e. unavailable).

#### Returns

LteRsrq.

#### 5.4.1.36.2.5 `const int telux::tel::LteSignalStrengthInfo::getLteReferenceSignalSnr ( ) const`

Get LTE reference signal signal-to-noise ratio, multiply by 0.1 to get SNR in dB. (Valid value range [-200, +300] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable). (-200 = -20.0 dB, +300 = 30dB).

##### Returns

LteSnr.

#### 5.4.1.36.2.6 `const int telux::tel::LteSignalStrengthInfo::getLteChannelQualityIndicator ( ) const`

Get LTE channel quality indicator. (Valid value range [0, 15] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Deprecated** This API not being supported

##### Returns

LteCqI.

#### 5.4.1.36.2.7 `const int telux::tel::LteSignalStrengthInfo::getTimingAdvance ( ) const`

Get the timing advance in micro seconds. (Valid value range [0, 0x7FFFFFFE] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Deprecated** This API not being supported

##### Returns

Timing advance value.

### 5.4.1.37 `class telux::tel::GsmSignalStrengthInfo`

GSM signal strength provides methods to get GSM signal strength in dBm and GSM signal level.

#### Public member functions

- `GsmSignalStrengthInfo` (int gsmSignalStrength, int gsmBitErrorRate, int timingAdvance)
- `const SignalStrengthLevel getLevel () const`
- `const int getDbm () const`
- `const int getGsmSignalStrength () const`
- `const int getGsmBitErrorRate () const`
- `const int getTimingAdvance ()`

### 5.4.1.37.1 Constructors and Destructors

5.4.1.37.1.1 `telux::tel::GsmSignalStrengthInfo::GsmSignalStrengthInfo ( int gsmSignalStrength, int gsmBitErrorRate, int timingAdvance )`

### 5.4.1.37.2 Member Function Documentation

5.4.1.37.2.1 `const SignalStrengthLevel telux::tel::GsmSignalStrengthInfo::getLevel ( ) const`

Get signal level in the range.

#### Returns

Signal levels indicates the quality of signal being received by the device.

5.4.1.37.2.2 `const int telux::tel::GsmSignalStrengthInfo::getDbm ( ) const`

Get the signal strength in dBm. (Valid value range [-113, -51] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

#### Returns

GSM signal strength in dBm.

5.4.1.37.2.3 `const int telux::tel::GsmSignalStrengthInfo::getGsmSignalStrength ( ) const`

Get the GSM signal strength. (Valid value range [0, 31] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

#### Returns

GSM signal strength.

5.4.1.37.2.4 `const int telux::tel::GsmSignalStrengthInfo::getGsmBitErrorRate ( ) const`

Get the GSM bit error rate. (Valid value range [0, 7] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Deprecated** This API not being supported

#### Returns

GSM bit error rate.

5.4.1.37.2.5 `const int telux::tel::GsmSignalStrengthInfo::getTimingAdvance ( )`

Get the timing advance in bit periods . 1 bit period = 48/13 us (Valid value range [0, 219] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Deprecated** This API not being supported

### Returns

timing advance.

### 5.4.1.38 class telux::tel::CdmaSignalStrengthInfo

CDMA signal strength provides methods to get details of CDMA and EVDO like signal strength in dBm and signal level.

#### Public member functions

- [CdmaSignalStrengthInfo](#) (int cdmaDbm, int cdmaEcio, int evdoDbm, int evdoEcio, int evdoSignalNoiseRatio)
- const [SignalStrengthLevel](#) [getLevel](#) () const
- const int [getDbm](#) () const
- const int [getCdmaEcio](#) () const
- const int [getEvdoEcio](#) () const
- const int [getEvdoSignalNoiseRatio](#) () const

#### 5.4.1.38.1 Constructors and Destructors

5.4.1.38.1.1 [telux::tel::CdmaSignalStrengthInfo::CdmaSignalStrengthInfo](#) ( int *cdmaDbm*, int *cdmaEcio*, int *evdoDbm*, int *evdoEcio*, int *evdoSignalNoiseRatio* )

#### 5.4.1.38.2 Member Function Documentation

5.4.1.38.2.1 const [SignalStrengthLevel](#) [telux::tel::CdmaSignalStrengthInfo::getLevel](#) ( ) const

Get signal level in the range.

### Returns

Signal levels indicates the quality of signal being received by the device.

5.4.1.38.2.2 const int [telux::tel::CdmaSignalStrengthInfo::getDbm](#) ( ) const

Get the signal strength in dBm.

### Returns

Minimum value of Evdo dBm and Cdma dBm.

#### 5.4.1.38.2.3 `const int telux::tel::CdmaSignalStrengthInfo::getCdmaEcio ( ) const`

Get the CDMA Ec/Io in dB.

##### Returns

CDMA Ec/Io.

#### 5.4.1.38.2.4 `const int telux::tel::CdmaSignalStrengthInfo::getEvdoEcio ( ) const`

Get the EVDO Ec/Io in dB.

##### Returns

EVDO Ec/Io.

#### 5.4.1.38.2.5 `const int telux::tel::CdmaSignalStrengthInfo::getEvdoSignalNoiseRatio ( ) const`

Get the EVDO signal noise ratio. (Valid value range [0, 8] and 8 is the highest signal to noise ratio.)

##### Returns

EVDO SNR.

### 5.4.1.39 `class telux::tel::WcdmaSignalStrengthInfo`

WCDMA signal strength provides methods to get WCDMA signal strength in dBm and WCDMA signal level.

#### Public member functions

- [WcdmaSignalStrengthInfo](#) (int signalStrength, int bitErrorRate)
- `const SignalStrengthLevel getLevel ( ) const`
- `const int getDbm ( ) const`
- `const int getSignalStrength ( ) const`
- `const int getBitErrorRate ( ) const`

#### 5.4.1.39.1 Constructors and Destructors

5.4.1.39.1.1 `telux::tel::WcdmaSignalStrengthInfo::WcdmaSignalStrengthInfo ( int signalStrength, int bitErrorRate )`

#### 5.4.1.39.2 Member Function Documentation

**5.4.1.39.2.1 const SignalStrengthLevel telux::tel::WcdmaSignalStrengthInfo::getLevel ( ) const**

Get signal level in the range.

**Returns**

Signal levels indicates the quality of signal being received by the device.

**5.4.1.39.2.2 const int telux::tel::WcdmaSignalStrengthInfo::getDbm ( ) const**

Get the signal strength in dBm. (Valid value range [-113, -51] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Returns**

WCDMA signal strength in dBm.

**5.4.1.39.2.3 const int telux::tel::WcdmaSignalStrengthInfo::getSignalStrength ( ) const**

Get the WCDMA signal strength. (Valid value range [0, 31] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Returns**

WCDMA signal strength.

**5.4.1.39.2.4 const int telux::tel::WcdmaSignalStrengthInfo::getBitErrorRate ( ) const**

Get the WCDMA bit error rate. (Valid value range [0, 7] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

**Deprecated** This API not being supported

**Returns**

WCDMA bit error rate.

**5.4.1.40 class telux::tel::TdsdmaSignalStrengthInfo**

Tdsdma signal strength provides methods to get received signal code power.

**Public member functions**

- [TdsdmaSignalStrengthInfo](#) (int rscp)
- const int [getRscp](#) () const

### 5.4.1.40.1 Constructors and Destructors

5.4.1.40.1.1 `telux::tel::TdscdmaSignalStrengthInfo::TdscdmaSignalStrengthInfo ( int rscp )`

### 5.4.1.40.2 Member Function Documentation

5.4.1.40.2.1 `const int telux::tel::TdscdmaSignalStrengthInfo::getRscp ( ) const`

Get TdScdma received signal code power in dBm. (Valid Range [-120,-25], and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable).

#### Returns

TdScdma signal code power.

### 5.4.1.41 class telux::tel::Nr5gSignalStrengthInfo

5G NR signal strength provides methods to get signal strength and signal-to-noise ratio.

#### Public member functions

- [Nr5gSignalStrengthInfo](#) (int rsrp, int rsrq, int rssnr)
- `const SignalStrengthLevel getLevel ( ) const`
- `const int getDbm ( ) const`
- `const int getReferenceSignalReceiveQuality ( ) const`
- `const int getReferenceSignalSnr ( ) const`

### 5.4.1.41.1 Constructors and Destructors

5.4.1.41.1.1 `telux::tel::Nr5gSignalStrengthInfo::Nr5gSignalStrengthInfo ( int rsrp, int rsrq, int rssnr )`

### 5.4.1.41.2 Member Function Documentation

5.4.1.41.2.1 `const SignalStrengthLevel telux::tel::Nr5gSignalStrengthInfo::getLevel ( ) const`

Get signal level in the range.

#### Returns

Signal levels indicates the quality of signal being received by the device.

#### 5.4.1.41.2.2 `const int telux::tel::Nr5gSignalStrengthInfo::getDbm ( ) const`

Get the signal strength in dBm. (Valid value range [-140, -44] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable). INVALID\_SIGNAL\_STRENGTH\_VALUE indicates that modem is not in ENDC connected mode.

##### Returns

5G NR dBm value.

#### 5.4.1.41.2.3 `const int telux::tel::Nr5gSignalStrengthInfo::getReferenceSignalReceiveQuality ( ) const`

Get 5G NR reference signal receive quality in dB. (Valid value range [-20, -3] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable). INVALID\_SIGNAL\_STRENGTH\_VALUE indicates that modem is not in ENDC connected mode.

##### Returns

5G NR rsrq.

#### 5.4.1.41.2.4 `const int telux::tel::Nr5gSignalStrengthInfo::getReferenceSignalSnr ( ) const`

Get 5G NR reference signal signal-to-noise ratio, multiply by 0.1 to get SNR in dB. (Valid value range [-200, +300] and INVALID\_SIGNAL\_STRENGTH\_VALUE i.e. unavailable). (-200 = -20.0 dB, +300 = 30dB). INVALID\_SIGNAL\_STRENGTH\_VALUE indicates that modem is not in ENDC connected mode.

##### Returns

5G NR signal-to-noise.

#### 5.4.1.42 `class telux::tel::VoiceServiceInfo`

[VoiceServiceInfo](#) is a container class for obtaining serving state details like phone is registered to home network, roaming, in service, out of service or only emergency calls allowed.

##### Public member functions

- [VoiceServiceInfo](#) ([VoiceServiceState](#) voiceServiceState, [VoiceServiceDenialCause](#) denialCause, [RadioTechnology](#) radioTech)
- [VoiceServiceState](#) [getVoiceServiceState](#) ()
- [VoiceServiceDenialCause](#) [getVoiceServiceDenialCause](#) ()
- bool [isEmergency](#) ()
- bool [isInService](#) ()
- bool [isOutOfService](#) ()
- [RadioTechnology](#) [getRadioTechnology](#) ()

### 5.4.1.42.1 Constructors and Destructors

**5.4.1.42.1.1** `telx::tel::VoiceServiceInfo::VoiceServiceInfo ( VoiceServiceState voiceServiceState, VoiceServiceDenialCause denialCause, RadioTechnology radioTech )`

### 5.4.1.42.2 Member Function Documentation

**5.4.1.42.2.1** `VoiceServiceState telx::tel::VoiceServiceInfo::getVoiceServiceState ( )`

Get voice service state.

#### Returns

[VoiceServiceState](#)

**5.4.1.42.2.2** `VoiceServiceDenialCause telx::tel::VoiceServiceInfo::getVoiceServiceDenialCause ( )`

Get Voice service denial cause

#### Returns

[VoiceServiceDenialCause](#)

**5.4.1.42.2.3** `bool telx::tel::VoiceServiceInfo::isEmergency ( )`

Check if phone service is in emergency mode (i.e Only emergency numbers are allowed)

**5.4.1.42.2.4** `bool telx::tel::VoiceServiceInfo::isInService ( )`

Check if phone is registered to home network or roaming network, phone is in service mode

**5.4.1.42.2.5** `bool telx::tel::VoiceServiceInfo::isOutOfService ( )`

check if phone not registered, phone is in out of service mode

**5.4.1.42.2.6** `RadioTechnology telx::tel::VoiceServiceInfo::getRadioTechnology ( )`

Get voice radio technology

#### Returns

[RadioTechnology](#)

## 5.4.2 Enumeration Type Documentation

### 5.4.2.1 enum telux::tel::CellType [strong]

Defines all the cell info types.

#### Enumerator

**GSM**  
**CDMA**  
**LTE**  
**WCDMA**  
**TDSCDMA**  
**NR5G**

### 5.4.2.2 enum telux::tel::ECallVariant [strong]

ECall Variant

#### Enumerator

**ECALL\_TEST** Initiate a test voice eCall with a configured telephone number stored in the USIM.  
**ECALL\_EMERGENCY** Initiate an emergency eCall. The trigger can be a manually initiated eCall or automatically initiated eCall.  
**ECALL\_VOICE** Initiate a regular voice call with capability to transfer an MSD.

### 5.4.2.3 enum telux::tel::EmergencyCallType [strong]

Emergency Call Type

#### Enumerator

**CALL\_TYPE\_ECALL** eCall (0x0C)

### 5.4.2.4 enum telux::tel::ECallMsdtTransmissionStatus [strong]

MSD Transmission Status

#### Enumerator

**SUCCESS** In-band MSD transmission is successful  
**FAILURE** In-band MSD transmission failed  
**MSD\_TRANSMISSION\_STARTED** In-band MSD transmission started  
**NACK\_OUT\_OF\_ORDER** Out of order NACK message detected during in-band MSD transmission  
**ACK\_OUT\_OF\_ORDER** Out of order ACK message detected during in-band MSD transmission  
**START\_RECEIVED** SEND-MSD(START) is received and SYNC is locked during in-band MSD transmission  
**LL\_ACK\_RECEIVED** Link-Layer Acknowledgement(LL-ACK) is received during in-band MSD transmission  
**OUTBAND\_MSD\_TRANSMISSION\_STARTED** Outband MSD transmission started in NG eCall  
**OUTBAND\_MSD\_TRANSMISSION\_SUCCESS** Outband MSD transmission succeeded in NG eCall  
**OUTBAND\_MSD\_TRANSMISSION\_FAILURE** Outband MSD transmission failed in NG eCall

#### 5.4.2.5 enum telux::tel::ECallCategory [strong]

ECall category

##### Enumerator

**VOICE\_EMER\_CAT\_AUTO\_ECALL** Automatic emergency call  
**VOICE\_EMER\_CAT\_MANUAL** Manual emergency call

#### 5.4.2.6 enum telux::tel::ECallVehicleType

Represents a vehicle class as per European eCall MSD standard. i.e. EN 15722.

##### Enumerator

**PASSENGER\_VEHICLE\_CLASS\_M1**  
**BUSES\_AND\_COACHES\_CLASS\_M2**  
**BUSES\_AND\_COACHES\_CLASS\_M3**  
**LIGHT\_COMMERCIAL\_VEHICLES\_CLASS\_N1**  
**HEAVY\_DUTY\_VEHICLES\_CLASS\_N2**  
**HEAVY\_DUTY\_VEHICLES\_CLASS\_N3**  
**MOTOR\_CYCLES\_CLASS\_L1E**  
**MOTOR\_CYCLES\_CLASS\_L2E**  
**MOTOR\_CYCLES\_CLASS\_L3E**  
**MOTOR\_CYCLES\_CLASS\_L4E**  
**MOTOR\_CYCLES\_CLASS\_L5E**  
**MOTOR\_CYCLES\_CLASS\_L6E**  
**MOTOR\_CYCLES\_CLASS\_L7E**

#### 5.4.2.7 enum telux::tel::ECallOptionalDataType [strong]

Represents OptionalDataType class as per European eCall MSD standard. i.e. EN 15722.

##### Enumerator

**ECALL\_DEFAULT**

#### 5.4.2.8 enum telux::tel::ECallMode [strong]

Represents eCall operating mode

##### Enumerator

**NORMAL** eCall and normal voice calls are allowed  
**ECALL\_ONLY** Only eCall is allowed  
**NONE** Invalid mode

#### 5.4.2.9 enum telux::tel::ECallModeReason [strong]

Represents eCall operating mode change reason

**Enumerator**

**NORMAL** eCall operating mode changed due to normal operation like setting of eCall mode  
**ERA\_GLONASS** eCall operating mode changed due to ERA-GLONASS operation

**5.4.2.10 enum telux::tel::HlapTimerStatus [strong]**

Represents the status of an eCall High Level Application Protocol(HLAP) timer that is maintained by the UE state machine.

**Enumerator**

**UNKNOWN** Unknown  
**INACTIVE** eCall Timer is Inactive i.e it has not started or it has stopped/expired  
**ACTIVE** eCall Timer is Active i.e it has started but not yet stopped/expired

**5.4.2.11 enum telux::tel::HlapTimerEvent [strong]**

Represents an event causing a change in the the status of eCall High Level Application Protocol (HLAP) timer that is maintained by the UE state machine.

Timer **STARTED** notification is provided when the timer moves from **INACTIVE** to **ACTIVE** state. Timer **STOPPED** notification is provided when the timer moves from **ACTIVE** to **INACTIVE** state, after its underlying condition is satisfied. Timer **EXPIRED** notification is provided when the timer moves from **ACTIVE** to **INACTIVE** state, after its underlying condition not satisfied until its timeout.

**Enumerator**

**UNKNOWN** Unknown  
**UNCHANGED** No change in timer status  
**STARTED** eCall Timer is Started  
**STOPPED** eCall Timer is Stopped  
**EXPIRED** eCall Timer is expired

**5.4.2.12 enum telux::tel::HlapTimerType [strong]**

Represents the type of an eCall High Level Application Protocol(HLAP) timer that is maintained by the UE state machine. The timers are represented according to EN 16062:2015 standard.

**Enumerator**

**UNKNOWN\_TIMER** eCall unknown timer  
**T2\_TIMER** eCall T2 timer  
**T5\_TIMER** eCall T5 timer  
**T6\_TIMER** eCall T6 timer  
**T7\_TIMER** eCall T7 timer  
**T9\_TIMER** eCall T9 timer  
**T10\_TIMER** eCall T10 timer

### 5.4.2.13 enum telux::tel::ECallNumType [strong]

Configuration that represents the type of the number to be dialed when an automotive emergency call is initiated.

#### Enumerator

**DEFAULT**  
**OVERRIDDEN**

### 5.4.2.14 enum telux::tel::EcallConfigType

Defines the supported ECall configuration parameters

#### Enumerator

**ECALL\_CONFIG\_MUTE\_RX\_AUDIO** Mute the local audio device during MSD transmission  
**ECALL\_CONFIG\_NUM\_TYPE** Decides which number needs to be dialed when an eCall is initiated  
**ECALL\_CONFIG\_OVERRIDDEN\_NUM** User configured/overridden number that will be dialed for eCall  
**ECALL\_CONFIG\_USE\_CANNED\_MSD** Use the pre-defined MSD in modem for eCall  
**ECALL\_CONFIG\_GNSS\_UPDATE\_INTERVAL** Time interval in milliseconds, at which modem updates the GNSS information in its internally generated MSD  
**ECALL\_CONFIG\_T2\_TIMER** T2 timer value  
**ECALL\_CONFIG\_T7\_TIMER** T7 timer value  
**ECALL\_CONFIG\_T9\_TIMER** T9 timer value  
**ECALL\_CONFIG\_MSD\_VERSION** MSD version to be used by modem when it internally generates MSD i.e when MSD is not sent by application and also canned MSD is not used  
**ECALL\_CONFIG\_COUNT**

### 5.4.2.15 enum telux::tel::RadioState [strong]

Defines the radio state

#### Enumerator

**RADIO\_STATE\_OFF** Radio is explicitly powered off  
**RADIO\_STATE\_UNAVAILABLE** Radio unavailable (eg, resetting or not booted)  
**RADIO\_STATE\_ON** Radio is on

### 5.4.2.16 enum telux::tel::ServiceState [strong]

Defines the service states

**Deprecated** Use requestVoiceServiceState() API or to know the status of phone

#### Enumerator

**EMERGENCY\_ONLY** Only emergency calls allowed  
**IN\_SERVICE** Normal operation, device is registered with a carrier and online  
**OUT\_OF\_SERVICE** Device is not registered with any carrier  
**RADIO\_OFF** Device radio is off - Airplane mode for example

**5.4.2.17 enum telux::tel::RadioTechnology [strong]**

Defines all available radio access technologies

**Enumerator**

**RADIO\_TECH\_UNKNOWN** Network type is unknown  
**RADIO\_TECH\_GPRS** Network type is GPRS  
**RADIO\_TECH\_EDGE** Network type is EDGE  
**RADIO\_TECH\_UMTS** Network type is UMTS  
**RADIO\_TECH\_IS95A** Network type is IS95A  
**RADIO\_TECH\_IS95B** Network type is IS95B  
**RADIO\_TECH\_1xRTT** Network type is 1xRTT  
**RADIO\_TECH\_EVDO\_0** Network type is EVDO revision 0  
**RADIO\_TECH\_EVDO\_A** Network type is EVDO revision A  
**RADIO\_TECH\_HSDPA** Network type is HSDPA  
**RADIO\_TECH\_HSUPA** Network type is HSUPA  
**RADIO\_TECH\_HSPA** Network type is HSPA  
**RADIO\_TECH\_EVDO\_B** Network type is EVDO revision B  
**RADIO\_TECH\_EHRPD** Network type is eHRPD  
**RADIO\_TECH\_LTE** Network type is LTE  
**RADIO\_TECH\_HSPAP** Network type is HSPA+  
**RADIO\_TECH\_GSM** Network type is GSM, Only supports voice  
**RADIO\_TECH\_TD\_SCDMA** Network type is TD SCDMA  
**RADIO\_TECH\_IWLAN** Network type is TD IWLAN  
**RADIO\_TECH\_LTE\_CA** Network type is LTE CA  
**RADIO\_TECH\_NR5G** Network type is NR5G

**5.4.2.18 enum telux::tel::RATCapability [strong]**

Defines all available RAT capabilities for each subscription

**Enumerator**

**AMPS**  
**CDMA**  
**HDR**  
**GSM**  
**WCDMA**  
**LTE**  
**TDS**  
**NR5G** NR5G NSA mode  
**NR5GSA** NR5G SA mode

**5.4.2.19 enum telux::tel::VoiceServiceTechnology [strong]**

Defines all voice support available on device

**Enumerator**

**VOICE\_TECH\_GW\_CSFB**  
**VOICE\_TECH\_1x\_CSFB**  
**VOICE\_TECH\_VOLTE**

**5.4.2.20 enum telux::tel::OperatingMode [strong]**

Defines operating modes of the device.

**Enumerator**

**ONLINE** Online mode  
**AIRPLANE** Low Power mode i.e temporarily disabled RF  
**FACTORY\_TEST** Special mode for manufacturer use  
**OFFLINE** Device has deactivated RF and partially shutdown  
**RESETTING** Device is in process of power cycling  
**SHUTTING\_DOWN** Device is in process of shutting down  
**PERSISTENT\_LOW\_POWER** Persists low power mode even on reset

**5.4.2.21 enum telux::tel::EcbMode [strong]**

Emergency callback mode

**Enumerator**

**NORMAL** Device is not in emergency callback mode(ECBM)  
**EMERGENCY** Device is in emergency callback mode(ECBM)

**5.4.2.22 enum telux::tel::SignalStrengthLevel [strong]**

Defines all the signal levels that [SignalStrength](#) class can return where level 1 is low and level 5 is high.

**Enumerator**

**LEVEL\_1**  
**LEVEL\_2**  
**LEVEL\_3**  
**LEVEL\_4**  
**LEVEL\_5**  
**LEVEL\_UNKNOWN**

**5.4.2.23 enum telux::tel::VoiceServiceState [strong]**

Defines the voice service states

**Enumerator**

**NOT\_REG\_AND\_NOT\_SEARCHING** Not registered, MT is not currently searching a new operator to register  
**REG\_HOME** Registered, home network  
**NOT\_REG\_AND\_SEARCHING** Not registered, but MT is currently searching a new operator to

register

**REG\_DENIED** Registration denied

**UNKNOWN** Unknown

**REG\_ROAMING** Registered, roaming

**NOT\_REG\_AND\_EMERGENCY\_AVAILABLE\_AND\_NOT\_SEARCHING** Same as NOT\_REG\_AND\_NOT\_SEARCHING but indicates that emergency calls are enabled

**NOT\_REG\_AND\_EMERGENCY\_AVAILABLE\_AND\_SEARCHING** Same as NOT\_REG\_AND\_SEARCHING but indicates that emergency calls are enabled

**REG\_DENIED\_AND\_EMERGENCY\_AVAILABLE** Same as REG\_DENIED but indicates that emergency calls are enabled

**UNKNOWN\_AND\_EMERGENCY\_AVAILABLE** Same as UNKNOWN but indicates that emergency calls are enabled

#### 5.4.2.24 enum telux::tel::VoiceServiceDenialCause [strong]

Defines the voice service denial cause why voice service state registration was denied See 3GPP TS 24.008, 10.5.3.6 and Annex G.

##### Enumerator

**UNDEFINED** Undefined

**GENERAL** General

**AUTH\_FAILURE** Authentication Failure

**IMSI\_UNKNOWN** IMSI unknown in HLR

**ILLEGAL\_MS** Illegal Mobile Station (MS), network refuses service to the MS either because an identity of the MS is not acceptable to the network or because the MS does not pass the authentication check

**IMSI\_UNKNOWN\_VLR** IMSI unknown in Visitors Location Register (VLR)

**IMEI\_NOT\_ACCEPTED** Network does not accept emergency call establishment using an IMEI or not accept attach procedure for emergency services using an IMEI

**ILLEGAL\_ME** ME used is not acceptable to the network

**GPRS\_SERVICES\_NOT\_ALLOWED** Not allowed to operate GPRS services.

**GPRS\_NON\_GPRS\_NOT\_ALLOWED** Not allowed to operate either GPRS or non-GPRS services

**MS\_IDENTITY\_FAILED** the network cannot derive the MS's identity from the P-TMSI/GUTI.

**IMPLICITLY\_DETACHED** network has implicitly detached the MS

**GPRS\_NOT\_ALLOWED\_IN\_PLMN** GPRS services not allowed in this PLMN

**MSC\_TEMPORARILY\_NOT\_REACHABLE** MSC temporarily not reachable

**SMS\_PROVIDED\_VIA\_GPRS** SMS provided via GPRS in this routing area

**NO\_PDP\_CONTEXT\_ACTIVATED** No PDP context activated

**PLMN\_NOT\_ALLOWED** if the network initiates a detach request or UE requests a services, in a PLMN where the MS, by subscription or due to operator determined barring is not allowed to operate.

**LOCATION\_AREA\_NOT\_ALLOWED** network initiates a detach request, in a location area where the HPLMN determines that the MS, by subscription, is not allowed to operate or roaming subscriber the subscriber is denied service even if other PLMNs are available on which registration was possible

**ROAMING\_NOT\_ALLOWED** Roaming not allowed in this Location Area

**NO\_SUITABLE\_CELLS** No Suitable Cells in this Location Area

**NOT\_AUTHORIZED** Not Authorized for this CSG

**NETWORK\_FAILURE** Network Failure

**MAC\_FAILURE** MAC failure  
**SYNC\_FAILURE** USIM detects that the SQN in the AUTHENTICATION REQUEST or AUTHENTICATION\_AND\_CIPHERING REQUEST message is out of range  
**CONGESTION** network cannot serve a request from the MS because of congestion  
**GSM\_AUTHENTICATION\_UNACCEPTABLE** GSM Authentication unacceptable  
**SERVICE\_OPTION\_NOT\_SUPPORTED** Service option not supported  
**SERVICE\_OPTION\_NOT\_SUBSCRIBED** Requested service option not subscribed  
**SERVICE\_OPTION\_OUT\_OF\_ORDER** Service option temporarily out of order  
**CALL\_NOT\_IDENTIFIED** Call cannot be identified  
**RETRY\_FOR\_NEW\_CELL** Retry upon entry into a new cell  
**INCORRECT\_MESSAGE** Semantically incorrect message  
**INVALID\_INFO** Invalid mandatory information  
**MSG\_TYPE\_NOT\_IMPLEMENTED** Message type non-existent or not implemented  
**MSG\_NOT\_COMPATIBLE** Message not compatible with protocol state  
**INFO\_NOT\_IMPLEMENTED** Information element non-existent or not implemented  
**CONDITIONAL\_IE\_ERROR** Conditional IE error  
**PROTOCOL\_ERROR\_UNSPECIFIED** Protocol error, unspecified

## 5.5 Call

This section contains APIs related to Call.

### 5.5.1 Data Structure Documentation

#### 5.5.1.1 class telux::tel::ICall

**ICall** represents a call in progress. An **ICall** cannot be directly created by the client, rather it is returned as a result of instantiating a call or from the PhoneListener when receiving an incoming call.

##### Public member functions

- virtual `telux::common::Status answer` (`std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status hold` (`std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status resume` (`std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status reject` (`std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status reject` (`const std::string &rejectSMS, std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status hangup` (`std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status playDtmfTone` (`char tone, std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status startDtmfTone` (`char tone, std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `telux::common::Status stopDtmfTone` (`std::shared_ptr< telux::common::ICommandResponseCallback > callback=nullptr`)=0
- virtual `CallState getCallState` ()=0
- virtual `int getCallIndex` ()=0
- virtual `CallDirection getCallDirection` ()=0
- virtual `std::string getRemotePartyNumber` ()=0
- virtual `CallEndCause getCallEndCause` ()=0
- virtual `int getPhoneId` ()=0
- virtual `bool isMultiPartyCall` ()=0
- virtual `~ICall` ()

**5.5.1.1.1 Constructors and Destructors**

**5.5.1.1.1.1** virtual telux::tel::ICall::~ICall ( ) [virtual]

**5.5.1.1.2 Member Function Documentation**

**5.5.1.1.2.1** virtual telux::common::Status telux::tel::ICall::answer ( std::shared\_ptr< telux::common::ICommandResponseCallback > *callback = nullptr* ) [pure virtual]

Allows the client to answer the call. This is only applicable for [CallState::INCOMING](#) and [CallState::WAITING](#) calls. If a Waiting call is being answered and the existing call is Active, then existing call will move to Hold state. If the existing call is on Hold already, then it will remain on Hold. The waiting call state transition from Waiting to Active.

**Parameters**

in	<i>callback</i>	- optional callback pointer to get the response of answer request below are possible error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>
----	-----------------	--

**Returns**

Status of hold function i.e. success or suitable error code.

**5.5.1.1.2.2** virtual telux::common::Status telux::tel::ICall::hold ( std::shared\_ptr< telux::common::ICommandResponseCallback > *callback = nullptr* ) [pure virtual]

Puts the ongoing call on hold.

**Parameters**

in	<i>callback</i>	<p>- optional callback pointer to get the response of hold request below are possible error codes for callback response</p> <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>
----	-----------------	---

**Returns**

Status of hold function i.e. success or suitable error code.

**5.5.1.1.2.3** `virtual telux::common::Status telux::tel::lCall::resume ( std::shared_ptr< telux::common::lCommandResponseCallback > callback = nullptr ) [pure virtual]`

Resumes this call from on-hold state to active state

**Parameters**

in	<i>callback</i>	<p>- optional callback pointer to get the response of resume request below are possible error codes for callback response</p> <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>
----	-----------------	---

**Returns**

Status of resume function i.e. success or suitable error code.

**5.5.1.1.2.4** `virtual telux::common::Status telux::tel::lCall::reject ( std::shared_ptr< telux::common::lCommandResponseCallback > callback = nullptr ) [pure virtual]`

Reject the incoming/waiting call. Only applicable for [CallState::INCOMING](#) and [CallState::WAITING](#) calls.

in	<i>callback</i>	- optional callback pointer to get the response of reject request below are possible error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>
----	-----------------	---

**Returns**

Status of reject function i.e. success or suitable error code.

**5.5.1.1.2.5** `virtual telux::common::Status telux::tel::lCall::reject ( const std::string & rejectSMS, std::shared_ptr< telux::common::lCommandResponseCallback > callback = nullptr ) [pure virtual]`

Reject the call and send an SMS to caller. Only applicable for [CallState::INCOMING](#) and [CallState::WAITING](#) calls.

**Parameters**

in	<i>rejectSMS</i>	SMS string used to send in response to a call rejection.
in	<i>callback</i>	- optional callback pointer to get the response of rejectwithSMS request below are possible error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>

**Deprecated** This API not being supported

**Returns**

Status of success for call [reject\(\)](#) or suitable error code.

### 5.5.1.1.2.6 virtual telux::common::Status telux::tel::lCall::hangup ( std::shared\_ptr< telux::common::lCommandResponseCallback > *callback* = nullptr ) [pure virtual]

Hangup the call if the call state is either active, hold, dialing, waiting or alerting.

#### Parameters

in	<i>callback</i>	<p>- optional callback pointer to get the response of hangup request below are possible error codes for callback response</p> <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>
----	-----------------	---

#### Returns

Status of hangup i.e. success or suitable error code.

### 5.5.1.1.2.7 virtual telux::common::Status telux::tel::lCall::playDtmfTone ( char *tone*, std::shared\_ptr< telux::common::lCommandResponseCallback > *callback* = nullptr ) [pure virtual]

Play a DTMF tone and stop it. The interval for which the tone is played is dependent on the system implementation. If continuous DTMF tone is playing, it will be stopped. This API is used to play DTMF tone on TX path so that it is heard on far end. For DTMF playback on local device on the RX path use [telux::audio::IAudioVoiceStream::playDtmfTone](#)

#### Parameters

in	<i>tone</i>	- a single character with one of 12 values: 0-9, *, #.
in	<i>callback</i>	- Optional callback pointer to get the result of playDtmfTones function

#### Returns

Status of playDtmfTones i.e. success or suitable error code.

### 5.5.1.1.2.8 virtual telux::common::Status telux::tel::lCall::startDtmfTone ( char *tone*, std::shared\_ptr< telux::common::lCommandResponseCallback > *callback* = nullptr ) [pure virtual]

Starts a continuous DTMF tone. To terminate the continuous DTMF tone, stopDtmfTone API needs to be invoked explicitly. This API is used to play DTMF tone on TX path so that it is heard on far end. For DTMF playback on local device on the RX path use [telux::audio::IAudioVoiceStream::playDtmfTone](#)

in	<i>tone</i>	- a single character with one of 12 values: 0-9, *, #.
in	<i>callback</i>	- Optional callback pointer to get the result of startDtmfTone function.

**Returns**

Status of startDtmfTone i.e. success or suitable error code.

**5.5.1.1.2.9 virtual telux::common::Status telux::tel::ICall::stopDtmfTone ( std::shared\_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]**

Stop the currently playing continuous DTMF tone.

**Parameters**

in	<i>callback</i>	- Optional callback pointer to get the result of stopDtmfTone function.
----	-----------------	---

**Returns**

Status of stopDtmfTone i.e. success or suitable error code.

**5.5.1.1.2.10 virtual CallState telux::tel::ICall::getCallState ( ) [pure virtual]**

Get the current state of the call, such as ringing, in progress etc.

**Returns**

CallState - enumeration representing call State

**5.5.1.1.2.11 virtual int telux::tel::ICall::getCallIndex ( ) [pure virtual]**

Get the unique index of the call assigned by Telephony subsystem

**Returns**

Call Index

**5.5.1.1.2.12 virtual CallDirection telux::tel::ICall::getCallDirection ( ) [pure virtual]**

Get the direction of the call

**Returns**

CallDirection - enumeration representing call direction i.e. INCOMING/ OUTGOING

**5.5.1.1.2.13 virtual std::string telux::tel::ICall::getRemotePartyNumber ( ) [pure virtual]**

Get the dialing number

**Returns**

Phone Number to which the call was dialed out Empty string in case of INCOMING call direction

**5.5.1.1.2.14 virtual CallEndCause telux::tel::ICall::getCallEndCause ( ) [pure virtual]**

Get the cause of the termination of the call.

**Returns**

Enum representing call end cause.

**5.5.1.1.2.15 virtual int telux::tel::ICall::getPhoneId ( ) [pure virtual]**

Get id of the phone object which represents the network/SIM on which the call is in progress.

**Returns**

Phone Id.

**5.5.1.1.2.16 virtual bool telux::tel::ICall::isMultiPartyCall ( ) [pure virtual]**

To check if call is in multi party call(conference) or not

**Returns**

True if call is in conference otherwise false.

**Note**

Eval: This is a new API and is being evaluated.It is subject to change and could break backwards compatibility.

**5.5.1.2 class telux::tel::ICallListener**

A listener class for monitoring changes in call, including call state change and ECall state change. Override the methods for the state that you wish to receive updates for.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void `onIncomingCall` (std::shared\_ptr< `ICall` > `call`)
- virtual void `onCallInfoChange` (std::shared\_ptr< `ICall` > `call`)
- virtual void `onECallMsdTransmissionStatus` (int `phoneId`, `telux::common::ErrorCode` `errorCode`)
- virtual void `onECallMsdTransmissionStatus` (int `phoneId`, `telux::tel::ECallMsdTransmissionStatus` `msdTransmissionStatus`)
- virtual void `onECallHlapTimerEvent` (int `phoneId`, `ECallHlapTimerEvents` `timersStatus`)
- virtual void `onEmergencyNetworkScanFail` (int `phoneId`)
- virtual void `onEcbmChange` (`telux::tel::EcbMode` `mode`)
- virtual `~ICallListener` ()

**5.5.1.2.1 Constructors and Destructors**

**5.5.1.2.1.1** virtual `telux::tel::ICallListener::~~ICallListener` ( ) [`virtual`]

**5.5.1.2.2 Member Function Documentation**

**5.5.1.2.2.1** virtual void `telux::tel::ICallListener::onIncomingCall` ( std::shared\_ptr< `ICall` > `call` ) [`virtual`]

This function is called when device receives an incoming/waiting call.

**Parameters**

in	<i>call</i>	- Pointer to <code>ICall</code> instance
----	-------------	--

**5.5.1.2.2.2** virtual void `telux::tel::ICallListener::onCallInfoChange` ( std::shared\_ptr< `ICall` > `call` ) [`virtual`]

This function is called when there is a change in call attributes

**Parameters**

in	<i>call</i>	- Pointer to <code>ICall</code> instance
----	-------------	--

**5.5.1.2.2.3** virtual void `telux::tel::ICallListener::onECallMsdTransmissionStatus` ( int *phoneId*, `telux::common::ErrorCode` *errorCode* ) [`virtual`]

This function is called when device completes MSD Transmission.

**Parameters**

in	<i>phoneId</i>	- Unique Id of phone on which MSD Transmission Status is being reported
----	----------------	---

in	<i>status</i>	- Indicates MSD Transmission status i.e. success or failure
----	---------------	---

**Deprecated** Use another [onECallMsdTransmissionStatus\(\)](#) API with argument `ECallMsdTransmissionStatus`

**5.5.1.2.2.4** `virtual void telux::tel::ICallListener::onECallMsdTransmissionStatus ( int phoneId, telux::tel::ECallMsdTransmissionStatus msdTransmissionStatus ) [virtual]`

This function is called when MSD Transmission status is changed.

#### Parameters

in	<i>phoneId</i>	- Unique Id of phone on which MSD Transmission Status is being reported
in	<i>msdTransmissionStatus</i>	- Indicates MSD Transmission status <code>ECallMsdTransmissionStatus</code>

**5.5.1.2.2.5** `virtual void telux::tel::ICallListener::onECallHlapTimerEvent ( int phoneId, ECallHlapTimerEvents timersStatus ) [virtual]`

This function is called when the eCall High Level Application Protocol(HLAP) timers status is changed.

#### Parameters

in	<i>phoneId</i>	- Unique Id of phone on which HLAP timer status is being reported
in	<i>timersStatus</i>	- Indicates the HLAP timer event <a href="#">ECallHlapTimerEvents</a>

**5.5.1.2.2.6** `virtual void telux::tel::ICallListener::onEmergencyNetworkScanFail ( int phoneId ) [virtual]`

This function is called whenever there is a scan failure after one round of network scan during origination of emergency call or at any time during the emergency call.

During origination of an ecall or in between an ongoing ecall, if the UE is in an area of no/poor coverage and loses service, the modem will perform network scan and try to register on any available network. If the scan completes successfully and the device finds a suitable cell, the ecall will be placed and the call state changes to the active state. If the network scan fails then this function will be invoked after one round of network scan.

#### Parameters

in	<i>phoneId</i>	- Unique Id of phone on which network scan failure reported.
----	----------------	--

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.5.1.2.2.7 virtual void telux::tel::ICallListener::onEcbmChange ( telux::tel::EcbMode *mode* ) [virtual]

This function is called whenever emergency callback mode(ECBM) changes.

#### Parameters

in	<i>mode</i>	- Indicates the status of the ECBM. <a href="#">EcbMode</a>
----	-------------	---

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.5.1.3 class telux::tel::ICallManager

Call Manager is the primary interface for call related operations Allows to conference calls, swap calls, make normal voice call and emergency call, send and update MSD pdu.

#### Public member functions

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual [telux::common::Status](#) makeCall (int phoneId, const std::string &dialNumber, std::shared\_ptr< [IMakeCallCallback](#) > callback=nullptr)=0

- virtual `~ICallManager` ()

### 5.5.1.3.1 Constructors and Destructors

5.5.1.3.1.1 virtual `telux::tel::ICallManager::~ICallManager` ( ) [virtual]

### 5.5.1.3.2 Member Function Documentation

5.5.1.3.2.1 virtual `telux::common::ServiceStatus telux::tel::ICallManager::getServiceStatus` ( ) [pure virtual]

This status indicates whether the `ICallManager` object is in a usable state.

#### Returns

`SERVICE_AVAILABLE` - If CallManager is ready for service. `SERVICE_UNAVAILABLE` - If CallManager is temporarily unavailable. `SERVICE_FAILED` - If CallManager encountered an irrecoverable failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.5.1.3.2.2** `virtual telux::common::Status telux::tel::ICallManager::makeCall ( int phoneId, const std::string & dialNumber, std::shared_ptr< IMakeCallCallback > callback = nullptr ) [pure virtual]`

Initiate a voice call. This API can also be used for e911/e112 type of regular emergency call. This is not meant for an automotive eCall.

**Parameters**

in	<i>phoneId</i>	Represents phone corresponding to which on make call operation is performed
in	<i>dialNumber</i>	String representing the dialing number
in	<i>callback</i>	Optional callback pointer to get the response of makeCall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <code>telux::common::ErrorCode::SUCCESS</code></li> <li>• <code>telux::common::ErrorCode::RADIO_NOT_AVAILABLE</code></li> <li>• <code>telux::common::ErrorCode::DIAL_MODIFIED_TO_USSD</code></li> <li>• <code>telux::common::ErrorCode::DIAL_MODIFIED_TO_SS</code></li> <li>• <code>telux::common::ErrorCode::DIAL_MODIFIED_TO_DIAL</code></li> <li>• <code>telux::common::ErrorCode::INVALID_ARGUMENTS</code></li> <li>• <code>telux::common::ErrorCode::NO_MEMORY</code></li> <li>• <code>telux::common::ErrorCode::INVALID_STATE</code></li> <li>• <code>telux::common::ErrorCode::NO_RESOURCES</code></li> <li>• <code>telux::common::ErrorCode::INTERNAL_ERR</code></li> <li>• <code>telux::common::ErrorCode::FDN_CHECK_FAILURE</code></li> <li>• <code>telux::common::ErrorCode::MODEM_ERR</code></li> <li>• <code>telux::common::ErrorCode::NO_SUBSCRIPTION</code></li> <li>• <code>telux::common::ErrorCode::NO_NETWORK_FOUND</code></li> <li>• <code>telux::common::ErrorCode::INVALID_CALL_ID</code></li> <li>• <code>telux::common::ErrorCode::DEVICE_IN_USE</code></li> <li>• <code>telux::common::ErrorCode::MODE_NOT_SUPPORTED</code></li> <li>• <code>telux::common::ErrorCode::ABORTED</code></li> <li>• <code>telux::common::ErrorCode::GENERIC_FAILURE</code></li> </ul>

**Returns**

Status of makeCall i.e. success or suitable status code.

**5.5.1.3.2.3** `virtual telux::common::Status telux::tel::ICallManager::makeECall ( int phoneId, const E↔ CallMsdData & eCallMsdData, int category, int variant, std::shared_ptr< IMakeCallCallback > callback = nullptr ) [pure virtual]`

Initiate an automotive eCall.

in	<i>phoneId</i>	Represents phone corresponding to which make eCall operation is performed
in	<i>eCallMsdData</i>	The structure containing required fields to create eCall Minimum Set of Data (MSD)
in	<i>category</i>	<a href="#">ECallCategory</a>
in	<i>variant</i>	<a href="#">ECallVariant</a>
in	<i>callback</i>	Optional callback pointer to get the response of makeECall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> <li>• <a href="#">telux::common::ErrorCode::MODEM_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_STATE</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_CALL_ID</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::OPERATION_NOT_ALLOWED</a></li> <li>• <a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>

### Returns

Status of makeECall i.e. success or suitable status code.

```
5.5.1.3.2.4 virtual telux::common::Status telux::tel::ICallManager::makeECall ( int phoneId, const std::string dialNumber, const ECallMsdData & eCallMsdData, int category, std::shared_ptr< IMakeCallCallback > callback = nullptr ) [pure virtual]
```

Initiate an automotive eCall to the specified phone number for TPS eCall. It will be treated like a regular voice call by the UE and the network.

### Parameters

in	<i>phoneId</i>	Represents phone corresponding to which make eCall operation is performed
in	<i>dialNumber</i>	String representing the dialing number
in	<i>eCallMsdData</i>	The structure containing required fields to create eCall Minimum Set of Data (MSD)
in	<i>category</i>	<a href="#">ECallCategory</a>

in	<i>callback</i>	Optional callback pointer to get the response of makeECall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> <li>• <a href="#">telux::common::ErrorCode::MODEM_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_STATE</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_CALL_ID</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::OPERATION_NOT_ALLOWED</a></li> <li>• <a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>
----	-----------------	--

### Returns

Status of makeECall i.e. success or suitable status code.

**5.5.1.3.2.5 virtual telux::common::Status telux::tel::ICallManager::makeECall ( int *phoneId*, const std::vector< uint8\_t > & *msdPdu*, int *category*, int *variant*, MakeCallCallback *callback* = nullptr ) [pure virtual]**

Initiate an automotive eCall with raw MSD pdu.

### Parameters

in	<i>phoneId</i>	Represents phone corresponding to which on make eCall operation is performed
in	<i>msdPdu</i>	Encoded MSD(Minimum Set of Data) PDU as per spec EN 15722 2015 or GOST R 54620-2011/33464-2015
in	<i>category</i>	<a href="#">ECallCategory</a>
in	<i>variant</i>	<a href="#">ECallVariant</a>
in	<i>callback</i>	Callback function to get the response of makeECall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> <li>• <a href="#">telux::common::ErrorCode::MODEM_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_STATE</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_CALL_ID</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::OPERATION_NOT_ALLOWED</a></li> <li>• <a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>

**Returns**

Status of makeECall i.e. success or suitable status code.

**5.5.1.3.2.6** `virtual telux::common::Status telux::tel::ICallManager::makeECall ( int phoneId,  
const std::string dialNumber, const std::vector< uint8_t > & msdPdu, int category,  
MakeCallCallback callback = nullptr ) [pure virtual]`

Initiate an automotive eCall with raw MSD pdu, to the specified phone number for TPS eCall. It will be treated like a regular voice call by the UE and the network.

**Parameters**

in	<i>phoneId</i>	Represents phone corresponding to which on make eCall operation is performed
in	<i>dialNumber</i>	String representing the dialing number
in	<i>msdPdu</i>	Encoded MSD(Minimum Set of Data) PDU as per spec EN 15722 2015 or GOST R 54620-2011/33464-2015
in	<i>category</i>	<a href="#">ECallCategory</a>
in	<i>callback</i>	Callback function to get the response of makeECall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> <li>• <a href="#">telux::common::ErrorCode::MODEM_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_STATE</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_CALL_ID</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::OPERATION_NOT_ALLOWED</a></li> <li>• <a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>

**Returns**

Status of makeECall i.e. success or suitable status code.

**5.5.1.3.2.7** `virtual telux::common::Status telux::tel::ICallManager::makeECall ( int phoneId, int  
category, int variant, MakeCallCallback callback = nullptr ) [pure virtual]`

Initiate an automotive eCall without transmitting Minimum Set of Data (MSD) at call connect.

**Parameters**

in	<i>phoneId</i>	Represents phone corresponding to which make eCall operation is performed
in	<i>category</i>	<a href="#">ECallCategory</a>
in	<i>variant</i>	<a href="#">ECallVariant</a>

in	<i>callback</i>	Optional callback function to get the response of makeECall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> <li>• <a href="#">telux::common::ErrorCode::MODEM_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_STATE</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_CALL_ID</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::OPERATION_NOT_ALLOWED</a></li> <li>• <a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>
----	-----------------	---

**Returns**

Status of makeECall i.e. success or suitable status code.

**5.5.1.3.2.8 virtual telux::common::Status telux::tel::ICallManager::makeECall ( int *phoneId*, const std::string *dialNumber*, int *category*, MakeCallCallback *callback* = nullptr ) [pure virtual]**

Initiate an automotive eCall to the specified phone number for TPS eCall, without transmitting Minimum Set of Data(MSD) at call connect. It will be treated like a regular voice call by the UE and the network.

**Parameters**

in	<i>phoneId</i>	Represents phone corresponding to which make eCall operation is performed
in	<i>dialNumber</i>	String representing the dialing number
in	<i>category</i>	<a href="#">ECallCategory</a>
in	<i>callback</i>	Optional callback function to get the response of makeECall request. Possible(not exhaustive) error codes for callback response <ul style="list-style-type: none"> <li>• <a href="#">telux::common::ErrorCode::SUCCESS</a></li> <li>• <a href="#">telux::common::ErrorCode::RADIO_NOT_AVAILABLE</a></li> <li>• <a href="#">telux::common::ErrorCode::NO_MEMORY</a></li> <li>• <a href="#">telux::common::ErrorCode::MODEM_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INTERNAL_ERR</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_STATE</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_CALL_ID</a></li> <li>• <a href="#">telux::common::ErrorCode::INVALID_ARGUMENTS</a></li> <li>• <a href="#">telux::common::ErrorCode::OPERATION_NOT_ALLOWED</a></li> <li>• <a href="#">telux::common::ErrorCode::GENERIC_FAILURE</a></li> </ul>

**Returns**

Status of makeECall i.e. success or suitable status code.

**5.5.1.3.2.9** `virtual telux::common::Status telux::tel::ICallManager::updateECallMsd ( int phoneId, const ECallMsdData & eCallMsd, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Update the eCall MSD in modem to be sent to Public Safety Answering [Point](#) (PSAP) when requested.

**Parameters**

in	<i>phoneId</i>	Represents phone corresponding to which updateECallMsd operation is performed
in	<i>eCallMsd</i>	The data structure represents the Minimum Set of Data (MSD)
in	<i>callback</i>	Optional callback pointer to get the response of updateECallMsd.

**Returns**

Status of updateECallMsd i.e. success or suitable error code.

**5.5.1.3.2.10** `virtual telux::common::Status telux::tel::ICallManager::updateECallMsd ( int phoneId, const std::vector< uint8_t > & msdPdu, telux::common::ResponseCallback callback ) [pure virtual]`

Update the eCall MSD in modem to be sent to Public Safety Answering [Point](#) (PSAP) when requested.

**Parameters**

in	<i>phoneId</i>	Represents phone corresponding to which updateECallMsd operation is performed
in	<i>msdPdu</i>	Encoded MSD(Minimum Set of Data) PDU as per spec EN 15722 2015 or GOST R 54620-2011/33464-2015
in	<i>callback</i>	Callback function to get the response of updateECallMsd.

**Returns**

Status of updateECallMsd i.e. success or suitable error code.

**5.5.1.3.2.11** `virtual telux::common::Status telux::tel::ICallManager::requestECallHlapTimerStatus ( int phoneId, ECallHlapTimerStatusCallback callback ) [pure virtual]`

Request for status of eCall High Level Application Protocol(HLAP) timers that are maintained by the UE state machine. This does not retrieve status of timers maintained by the PSAP. The provided timers are as per EN 16062:2015 standard.

in	<i>phoneId</i>	Represents phone corresponding on which requestECallHlapTimerStatus operation is performed
in	<i>callback</i>	Callback function to get the response of requestECallHlapTimerStatus

**Returns**

Status of requestECallHlapTimerStatus i.e. success or suitable error code.

#### 5.5.1.3.2.12 `virtual std::vector<std::shared_ptr<ICall> > telux::tel::ICallManager::getInProgressCalls ( ) [pure virtual]`

Get in-progress calls.

**Returns**

List of active calls.

#### 5.5.1.3.2.13 `virtual telux::common::Status telux::tel::ICallManager::conference ( std::shared_ptr< ICall > call1, std::shared_ptr< ICall > call2, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Merge two calls in a conference.

**Parameters**

in	<i>call1</i>	Call object to conference.
in	<i>call2</i>	Call object to conference.
in	<i>callback</i>	Optional callback pointer to get the result of conference function

**Returns**

Status of conference i.e. success or suitable error code.

#### 5.5.1.3.2.14 `virtual telux::common::Status telux::tel::ICallManager::swap ( std::shared_ptr< ICall > callToHold, std::shared_ptr< ICall > callToActivate, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Swap calls to make one active and put the another on hold.

**Parameters**

in	<i>callToHold</i>	Active call object to swap to hold state.
in	<i>callToActivate</i>	Hold call object to swap to active state.
in	<i>callback</i>	Optional callback pointer to get the result of swap function

## Returns

Status of swap i.e. success or suitable error code.

**5.5.1.3.2.15** `virtual telux::common::Status telux::tel::lCallManager::hangupForegroundResumeBackground ( int phoneld, common::ResponseCallback callback = nullptr ) [pure virtual]`

Hangup all the foreground call(s) if any and accept the background call as the active call. The foreground call here could be active call, incoming call or multiple active calls in case of conference and background call could be held call or waiting call.

If a call(s) is active, the active call(s) will be terminated or if a call is waiting, the waiting call will be accepted and becomes active. Otherwise, if a held call is present, the held call becomes active. In case of hold and waiting calls, the hold call will still be on hold and waiting call will be accepted. In case of hold, active and waiting scenario, the hold call will still be on hold, active call will be ended and waiting call will be accepted.

## Parameters

in	<i>callback</i>	<p>- optional callback pointer to get the response of hangup request below are possible error codes for callback response</p> <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• RADIO_NOT_AVAILABLE</li> <li>• NO_MEMORY</li> <li>• MODEM_ERR</li> <li>• INTERNAL_ERR</li> <li>• INVALID_STATE</li> <li>• INVALID_CALL_ID</li> <li>• INVALID_ARGUMENTS</li> <li>• OPERATION_NOT_ALLOWED</li> <li>• GENERIC_FAILURE</li> </ul>
----	-----------------	---

## Returns

Status of hangupForegroundResumeBackground i.e. success or suitable error code.

## Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.5.1.3.2.16** `virtual telux::common::Status telux::tel::lCallManager::requestEcbm ( int phoneld, EcbmStatusCallback callback ) [pure virtual]`

Request for emergency callback mode

in	<i>phoneId</i>	Represents the phone corresponding to which the emergency callback mode(ECBM) status is requested. param [in] callback Callback pointer to get the result of ECBM status request
----	----------------	---

**Returns**

Status of requestEcbm i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.5.1.3.2.17 virtual telux::common::Status telux::tel::lCallManager::exitEcbm ( int *phoneId*, common::ResponseCallback *callback* = nullptr ) [pure virtual]

Exit emergency callback mode.

**Parameters**

in	<i>phoneId</i>	Represents the phone corresponding to which the emergency callback mode(ECBM) exit is requested. param [in] callback Optional callback pointer to get the result of exit ECBM request
----	----------------	--

**Returns**

Status of exitEcbm i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.5.1.3.2.18 virtual telux::common::Status telux::tel::lCallManager::requestNetworkDeregistration ( int *phoneId*, common::ResponseCallback *callback* = nullptr ) [pure virtual]

De-register from the network after an ecall, when the modem is operating in eCall-only configuration. This is typically performed after expiry of T9 eCall HLAP timer(minimum network registration period), to stop T10 eCall HLAP timer i.e De-registration Fallback Timer (DFT) and de-register from the serving network.

On platforms with Access control enabled, Caller needs to have TELUX\_TEL\_ECALL\_MGMT permission to invoke this API successfully.

**Parameters**

in	<i>phoneId</i>	Represents the phone corresponding to which the network deregistration will be performed.
in	<i>callback</i>	Callback function to get the response of the request. The response is sent after the operation is complete.

**Returns**

Status of requestNetworkDeregistration request i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.5.1.3.2.19** `virtual telux::common::Status telux::tel::ICallManager::updateEcallHlapTimer ( int phoneId, HlapTimerType type, uint32_t timeDuration, common::ResponseCallback callback = nullptr ) [pure virtual]`

Set the value of an eCall HLAP timer. Only the T10 Timer is supported currently.

On platforms with Access control enabled, Caller needs to have TELUX\_TEL\_ECALL\_MGMT permission to invoke this API successfully.

**Parameters**

in	<i>phoneId</i>	Represents the phone corresponding to which the value of T10 eCall HLAP timer updated will be performed.
in	<i>type</i>	<a href="#">HlapTimerType</a>
in	<i>timeDuration</i>	Represents the time duration for the HLAP timer. T10 timer is in units of minutes, and the supported range is from 60 to 720.
in	<i>callback</i>	Callback function to get the response of the request. The response is sent after the operation is complete.

**Returns**

Status of updateEcallHlapTimer i.e., success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.5.1.3.2.20** `virtual telux::common::Status telux::tel::ICallManager::requestEcallHlapTimer ( int phoneId, HlapTimerType type, EcallHlapTimerCallback callback ) [pure virtual]`

Get the value of an eCall HLAP timer. Only the T10 Timer is supported currently.

On platforms with Access control enabled, Caller needs to have TELUX\_TEL\_ECALL\_MGMT permission to invoke this API successfully.

**Parameters**

in	<i>phoneId</i>	Represents the phone corresponding to which the value of eCall HLAP timer query will be performed.
in	<i>type</i>	<a href="#">HlapTimerType</a>

in	<i>callback</i>	Callback function to get the response of the request. The response is sent after the operation is complete.
----	-----------------	---

**Returns**

Status of requestEcallHlapTimer i.e., success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.5.1.3.2.21 virtual telux::common::Status telux::tel::ICallManager::setConfig ( EcallConfig *config* ) [pure virtual]

Set the configuration related to emergency call. The configuration is persistent and takes effect when the next emergency call is dialed.

**Parameters**

in	<i>config</i>	eCall configuration to be set <a href="#">EcallConfig</a>
----	---------------	---

**Returns**

Status of setConfig i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.5.1.3.2.22 virtual telux::common::Status telux::tel::ICallManager::getConfig ( EcallConfig & *config* ) [pure virtual]

Get the configuration related to emergency call.

**Parameters**

out	<i>config</i>	Parameter to hold the fetched eCall configuration <a href="#">EcallConfig</a>
-----	---------------	---

**Returns**

Status of getConfig i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.5.1.3.2.23** `virtual telux::common::Status telux::tel::ICallManager::registerListener ( std::shared_ptr< telux::tel::ICallListener > listener ) [pure virtual]`

Add a listener to listen for incoming call, call info change and eCall MSD transmission status change.

#### Parameters

in	<i>listener</i>	Pointer to <a href="#">ICallListener</a> object which receives event corresponding to phone
----	-----------------	---

#### Returns

Status of registerListener i.e. success or suitable error code.

**5.5.1.3.2.24** `virtual telux::common::Status telux::tel::ICallManager::removeListener ( std::shared_ptr< telux::tel::ICallListener > listener ) [pure virtual]`

Remove a previously added listener.

#### Parameters

in	<i>listener</i>	Listener to be removed.
----	-----------------	-------------------------

#### Returns

Status of removeListener i.e. success or suitable error code.

### 5.5.1.4 class telux::tel::IMakeCallCallback

Interface for Make Call callback object. Client needs to implement this interface to get single shot responses for commands like make call.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [makeCallResponse](#) (telux::common::ErrorCode error, std::shared\_ptr< ICall > call=nullptr)
- virtual [~IMakeCallCallback](#) ()

#### 5.5.1.4.1 Constructors and Destructors

**5.5.1.4.1.1** `virtual telux::tel::IMakeCallCallback::~IMakeCallCallback ( ) [virtual]`

### 5.5.1.4.2 Member Function Documentation

#### 5.5.1.4.2.1 virtual void telux::tel::IMakeCallCallback::makeCallResponse ( telux::common::ErrorCode error, std::shared\_ptr< ICall > call = nullptr ) [virtual]

This function is called with the response to makeCall API.

#### Parameters

out	<i>error</i>	ErrorCode
out	<i>call</i>	Pointer to Call object or nullptr in case of failure

## 5.5.2 Enumeration Type Documentation

### 5.5.2.1 enum telux::tel::CallDirection [strong]

Defines type of call like incoming, outgoing and none.

#### Enumerator

**INCOMING**  
**OUTGOING**  
**NONE**

### 5.5.2.2 enum telux::tel::CallState [strong]

Defines the states a call can be in

#### Enumerator

**CALL\_IDLE** idle call, default state of a newly created call object  
**CALL\_ACTIVE** active call  
**CALL\_ON\_HOLD** on hold call  
**CALL\_DIALING** out going call, in dialing state and not yet connected, MO Call only  
**CALL\_INCOMING** incoming call, not yet answered  
**CALL\_WAITING** waiting call  
**CALL\_ALERTING** alerting call, MO Call only  
**CALL\_ENDED** call ended / disconnected

### 5.5.2.3 enum telux::tel::CallEndCause [strong]

Reason for the recently terminated call (either normally ended or failed)

#### Enumerator

**UNOBTAINABLE\_NUMBER**  
**NO\_ROUTE\_TO\_DESTINATION**  
**CHANNEL\_UNACCEPTABLE**  
**OPERATOR\_DETERMINED\_BARRING**  
**NORMAL**  
**BUSY**

## 5.6 SMS

This section contains APIs related to Sending and Receiving SMS.

### 5.6.1 Data Structure Documentation

#### 5.6.1.1 struct telux::tel::DeleteInfo

Specify delete information used for deleting message on storage.

##### Data fields

Type	Field	Description
<a href="#">DeleteType</a>	delType	Specifies the type of delete operation to be performed
<a href="#">SmsTagType</a>	tagType	1.If SMS tag type is set to <a href="#">telux::tel::SmsTagType::UNKNOWN</a> and delType is set to <a href="#">telux::tel::DeleteType::DELETE_ALL</a> then all messages on the storage would be deleted. 2.To delete all messages of a particular tag, set tagType to the particular tag like <a href="#">telux::tel::SmsTagType::MT_READ</a> and delType to <a href="#">telux::tel::DeleteType::DELETE_MESSAGES_BY_TAG</a>
uint32_t	msgIndex	To delete message at specific index, specify msgIndex and delType as <a href="#">telux::tel::DeleteType::DELETE_MSG_AT_INDEX</a>

#### 5.6.1.2 struct telux::tel::SmsMetaInfo

Provides certain attributes of an SMS message.

##### Data fields

Type	Field	Description
uint32_t	msgIndex	Message index on storage
<a href="#">SmsTagType</a>	tagType	SMS tag type

#### 5.6.1.3 struct telux::tel::MessageAttributes

Contains structure of message attributes like encoding type, number of segments, characters left in last segment.

##### Data fields

Type	Field	Description
<a href="#">SmsEncoding</a>	encoding	Data encoding type
int	numberOf↔ Segments	Number of segments
int	segmentSize	Max size of each segment
int	numberOf↔ CharsLeftIn↔ LastSegment	characters left in last segment

### 5.6.1.4 struct telux::tel::MessagePartInfo

Structure containing information about the part of multi-part SMS such as concatenated message reference number, number of segments and segment number. During concatenation this information along with originating address helps in associating each part of the multi-part message to the corresponding multi-part message.

#### Data fields

Type	Field	Description
uint16_t	refNumber	Concatenated message reference number as per spec 3GPP TS 23.040 9.2.3.24.1. For each part of multipart message this message reference will be the same
uint8_t	numberOf↔ Segments	Number of segments
uint8_t	segment↔ Number	Segment Number

### 5.6.1.5 class telux::tel::SmsMessage

Data structure represents an incoming SMS. This is applicable for single part message or part of the multipart message.

#### Public member functions

- [SmsMessage](#) (std::string text, std::string sender, std::string receiver, [SmsEncoding](#) encoding, std::string pdu, [PduBuffer](#) pduBuffer, std::shared\_ptr< [MessagePartInfo](#) > info)
- [SmsMessage](#) (std::string text, std::string sender, std::string receiver, [SmsEncoding](#) encoding, std::string pdu, [PduBuffer](#) pduBuffer, std::shared\_ptr< [MessagePartInfo](#) > info, bool isMetaInfoValid, [SmsMetaInfo](#) metaInfo)
- const std::string & [getText](#) () const
- const std::string & [getSender](#) () const
- const std::string & [getReceiver](#) () const
- [SmsEncoding](#) [getEncoding](#) () const
- const std::string & [getPdu](#) () const
- [PduBuffer](#) [getRawPdu](#) () const
- std::shared\_ptr< [MessagePartInfo](#) > [getMessagePartInfo](#) ()
- const std::string [toString](#) () const
- [telux::common::Status](#) [getMetaInfo](#) ([SmsMetaInfo](#) &metaInfo)

#### 5.6.1.5.1 Constructors and Destructors

**5.6.1.5.1.1** `telux::tel::SmsMessage::SmsMessage ( std::string text, std::string sender, std::string receiver, SmsEncoding encoding, std::string pdu, PduBuffer pduBuffer, std::shared_ptr< MessagePartInfo > info )`

**5.6.1.5.1.2** `telux::tel::SmsMessage::SmsMessage ( std::string text, std::string sender, std::string receiver, SmsEncoding encoding, std::string pdu, PduBuffer pduBuffer, std::shared_ptr< MessagePartInfo > info, bool isMetalInfoValid, SmsMetalInfo metalInfo )`

### 5.6.1.5.2 Member Function Documentation

**5.6.1.5.2.1** `const std::string& telux::tel::SmsMessage::getText ( ) const`

Get the message text for the single part message or part of the multipart message.

#### Returns

String containing SMS message.

**5.6.1.5.2.2** `const std::string& telux::tel::SmsMessage::getSender ( ) const`

Get the originating address (sender address).

#### Returns

String containing sender address.

**5.6.1.5.2.3** `const std::string& telux::tel::SmsMessage::getReceiver ( ) const`

Get the destination address (receiver address).

#### Returns

String containing receiver address

**5.6.1.5.2.4** `SmsEncoding telux::tel::SmsMessage::getEncoding ( ) const`

Get encoding format used for the single part message or part of the multipart message.

#### Returns

SMS message encoding used.

**5.6.1.5.2.5** `const std::string& telux::tel::SmsMessage::getPdu ( ) const`

Get the raw PDU for the single part message or part of the multipart message.

#### Returns

String containing raw PDU content.

**Deprecated** Use API `SmsMessage::getRawPdu`

#### 5.6.1.5.2.6 PduBuffer telux::tel::SmsMessage::getRawPdu ( ) const

Get the raw PDU buffer for the single part message or part of the multipart message.

##### Returns

Buffer containing raw PDU content.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backward compatibility

#### 5.6.1.5.2.7 std::shared\_ptr<MessagePartInfo> telux::tel::SmsMessage::getMessagePartInfo ( )

Applicable for multi-part SMS only. Get the information such as segment number, number of segments and concatenated reference number corresponding to the part of multi-part SMS.

##### Returns

If a message is single part SMS the method returns null otherwise returns message part information.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.5.2.8 const std::string telux::tel::SmsMessage::toString ( ) const

Get the text related informative representation of this object.

##### Returns

String containing informative string.

#### 5.6.1.5.2.9 telux::common::Status telux::tel::SmsMessage::getMetaInfo ( SmsMetaInfo & metaInfo )

Get meta information of SMS stored in storage. There is no meta information when storage type is none.

##### Parameters

out	<i>metaInfo</i>	Meta information about SMS message stored in storage.
-----	-----------------	---

##### Returns

Status of `getMetaInfo` i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.6.1.6 class telux::tel::ISmsManager**

SmsManager class is the primary interface to manage SMS operations such as send and receive an SMS text and raw encoded PDU(s). This class handles single part and multi-part messages.

**Public member functions**

- virtual [telux::common::ServiceStatus getServiceStatus \(\)](#)=0
- virtual [telux::common::Status sendSms](#) (const std::string &message, const std::string &receiver←Address, std::shared\_ptr< [telux::common::ICommandResponseCallback](#) > callback=nullptr, std::shared\_ptr< [telux::common::ICommandResponseCallback](#) > deliveryCallback=nullptr)=0
- virtual [telux::common::Status sendSms](#) (std::string message, std::string receiverAddress, bool deliveryReportNeeded=true, [SmsResponseCb](#) sentCallback=nullptr, std::string smscAddr="")=0
- virtual [telux::common::Status sendRawSms](#) (const std::vector< [PduBuffer](#) > rawPdus, [SmsResponseCb](#) sentCallback=nullptr)=0
- virtual [telux::common::Status requestSmscAddress](#) (std::shared\_ptr< [ISmscAddressCallback](#) > callback=nullptr)=0
- virtual [telux::common::Status setSmscAddress](#) (const std::string &smscAddress, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status requestSmsMessageList](#) ([SmsTagType](#) type, [RequestSmsInfoListCb](#) callback)=0
- virtual [telux::common::Status readMessage](#) (uint32\_t messageIndex, [ReadSmsMessageCb](#) callback)=0
- virtual [telux::common::Status deleteMessage](#) ([DeleteInfo](#) info, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status requestPreferredStorage](#) ([RequestPreferredStorageCb](#) callback)=0
- virtual [telux::common::Status setPreferredStorage](#) ([StorageType](#) storageType, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status setTag](#) (uint32\_t msgIndex, [SmsTagType](#) tagType, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status requestStorageDetails](#) ([RequestStorageDetailsCb](#) callback)=0
- virtual [MessageAttributes calculateMessageAttributes](#) (const std::string &message)=0
- virtual int [getPhoneId](#) ()=0
- virtual [telux::common::Status registerListener](#) (std::weak\_ptr< [ISmsListener](#) > listener)=0
- virtual [telux::common::Status removeListener](#) (std::weak\_ptr< [ISmsListener](#) > listener)=0
- virtual [~ISmsManager](#) ()

### 5.6.1.6.1 Constructors and Destructors

5.6.1.6.1.1 `virtual telux::tel::ISmsManager::~ISmsManager ( ) [virtual]`

### 5.6.1.6.2 Member Function Documentation

5.6.1.6.2.1 `virtual telux::common::ServiceStatus telux::tel::ISmsManager::getServiceStatus ( ) [pure virtual]`

This status indicates whether the [ISmsManager](#) object is in a usable state.

#### Returns

[telux::common::ServiceStatus](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

5.6.1.6.2.2 `virtual telux::common::Status telux::tel::ISmsManager::sendSms ( const std::string & message, const std::string & receiverAddress, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr, std::shared_ptr< telux::common::ICommandResponseCallback > deliveryCallback = nullptr ) [pure virtual]`

Send SMS to the destination address. When registered on IMS the SMS will be attempted over IMS. If sending SMS over IMS fails, an automatic retry would be attempted to send the message over CS. Only support UCS2 format, GSM 7 bit default alphabet and does not support National language shift tables.

#### Parameters

in	<i>message</i>	Message text to be sent
in	<i>receiverAddress</i>	Receiver or destination address
in	<i>sentCallback</i>	Optional callback pointer to get the response of send SMS request.
in	<i>deliveryCallback</i>	Optional callback pointer to get message delivery status

**Deprecated** Use API [ISmsManager::sendSms\(const std::string &message, const std::string &receiverAddress, bool deliveryReportNeeded = true, SmsResponseCb callback = nullptr, std::string smscAddr = ""\)](#)

#### Returns

Status of sendSms i.e. success or suitable error code.

**5.6.1.6.2.3** virtual `telux::common::Status telux::tel::ISmsManager::sendSms ( std::string message, std::string receiverAddress, bool deliveryReportNeeded = true, SmsResponseCb sentCallback = nullptr, std::string smscAddr = "" ) [pure virtual]`

Send single or multipart SMS to the destination address. When registered on IMS the SMS will be attempted over IMS. If sending SMS over IMS fails, an automatic retry would be attempted to send the message over CS. Only support UCS2 format, GSM 7 bit default alphabet and does not support National language shift tables. The SMS is sent directly not stored on storage.

#### Parameters

in	<i>message</i>	Message text to be send.
in	<i>receiverAddress</i>	Receiver or destination address
in	<i>deliveryReportNeeded</i>	Delivery status received in the listener API <a href="#">telux::tel::ISmsListener</a> if <code>deliveryReportNeeded</code> is true. Provided recipient responds to SMSC before the validity period expires. If <code>deliveryReportNeeded</code> is false delivery report will not be received.
in	<i>sentCallback</i>	Optional callback pointer to get the sent response for single part or multi-part SMS.
in	<i>smcAddr</i>	SMS is sent to SMSC address. If SMSC address is empty then pre-configured SMSC address is used.

#### Returns

Status of `sendSms` i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.6.1.6.2.4** virtual `telux::common::Status telux::tel::ISmsManager::sendRawSms ( const std::vector< PduBuffer > rawPdus, SmsResponseCb sentCallback = nullptr ) [pure virtual]`

Send an SMS that is provided as a raw encoded PDU(s). When registered on IMS the SMS will be attempted over IMS. If sending SMS over IMS fails, an automatic retry would be attempted to send the message over CS. If the SMS is a multi-part message, the API expects multiple PDU to be passed to it. The SMS is sent directly not stored on storage.

#### Parameters

in	<i>rawPdus</i>	Each element in the vector represents a part of a multipart message. For single part message the vector will have single element.
in	<i>sentCallback</i>	Optional callback to get the sent response for single part or multi-part SMS.

**Returns**

Status of sendRawSms i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.6.1.6.2.5 virtual telux::common::Status telux::tel::ISmsManager::requestSmscAddress ( std::shared\_ptr< ISmscAddressCallback > callback = nullptr ) [pure virtual]**

Request for Short Messaging Service Center (SMSC) Address. Purpose of SMSC is to store, forward, convert and deliver Short Message Service (SMS) messages.

**Parameters**

in	<i>callback</i>	Optional callback pointer to get the response of Smsc address request
----	-----------------	---

**Returns**

Status of getSmscAddress i.e. success or suitable error code.

**5.6.1.6.2.6 virtual telux::common::Status telux::tel::ISmsManager::setSmscAddress ( const std::string & smscAddress, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

Sets the Short Message Service Center(SMSC) address on the device.

This will change the SMSC address for all the SMS messages sent from any app.

**Parameters**

in	<i>smscAddress</i>	SMSC address
in	<i>callback</i>	Optional callback pointer to get the response of set SMSC address

**Returns**

Status of setSmscAddress i.e. success or suitable error code.

**5.6.1.6.2.7 virtual telux::common::Status telux::tel::ISmsManager::requestSmsMessageList ( SmsTagType type, RequestSmsInfoListCb callback ) [pure virtual]**

Requests a list of message information for the messages saved in SIM storage.

**Parameters**

in	<i>type</i>	Specifies the tag type of the SMS message that should be matched when retrieving the list. Specifying <a href="#">telux::tel::SmsTagType::UNKNOWN</a> will retrieve all the messages from storage.
in	<i>callback</i>	Callback to get the response of request SMS messages info.

**Returns**

Status of requestSmsMessageList i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.6.2.8 virtual telux::common::Status telux::tel::ISmsManager::readMessage ( uint32\_t *messageIndex*, ReadSmsMessageCb *callback* ) [pure virtual]

Retrieve a particular message from SIM storage matching the index.

**Parameters**

in	<i>messageIndex</i>	SMS index on storage.
in	<i>callback</i>	Callback to get the response of read SMS message from storage .

**Returns**

Status of readMessage i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.6.2.9 virtual telux::common::Status telux::tel::ISmsManager::deleteMessage ( DeleteInfo *info*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]

Delete specific SMS based on message index or delete messages on SIM storage based on [telux::tel::SmsTagType](#) or delete all messages from SIM storage.

**Parameters**

in	<i>info</i>	Specify delete information based on which messages are deleted
in	<i>callback</i>	Optional callback to get the response of delete SMS message from storage .

**Returns**

Status of deleteMessage i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.6.2.10 **virtual telux::common::Status telux::tel::ISmsManager::requestPreferredStorage ( RequestPreferredStorageCb *callback* ) [pure virtual]**

Request preferred storage for incoming SMS.

**Parameters**

in	<i>callback</i>	Callback to get the response of get preferred storage type .
----	-----------------	--

**Returns**

Status of requestPreferredStorage i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.6.2.11 **virtual telux::common::Status telux::tel::ISmsManager::setPreferredStorage ( StorageType *storageType*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]**

Set the preferred storage for incoming SMS. All future messages that arrive will be stored on the storage set in this API, if any. Messages in the current storage will not be moved to the new storage. If client does not require messages to be stored by the platform, then the storage could be set to [telux::tel::StorageType::NONE](#).

**Parameters**

in	<i>storageType</i>	<a href="#">telux::tel::StorageType</a>
in	<i>callback</i>	Optional callback to get the response of set preferred storage.

**Returns**

Status of setPreferredStorage i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.6.1.6.2.12** `virtual telux::common::Status telux::tel::ISmsManager::setTag ( uint32_t msgIndex, SmsTagType tagType, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Update the tag of the incoming message stored in SIM storage as read/unread

#### Parameters

in	<i>msgIndex</i>	Message index corresponding to message in storage for which tag needs to be updated.
in	<i>tagType</i>	<code>telux::tel::SmsTagType</code> . The applicable tag types are MT_READ and MT_NOT_READ.
in	<i>callback</i>	Optional callback to get the response of updating the tag.

#### Returns

Status of setTag i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.6.1.6.2.13** `virtual telux::common::Status telux::tel::ISmsManager::requestStorageDetails ( RequestStorageDetailsCb callback ) [pure virtual]`

Request details about SIM storage like total size and available size in terms of number of messages.

#### Parameters

in	<i>callback</i>	Callback to get the response of storage detail request.
----	-----------------	---

#### Returns

Status of requestStorageDetails i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.6.1.6.2.14** `virtual MessageAttributes telux::tel::ISmsManager::calculateMessageAttributes ( const std::string & message ) [pure virtual]`

Calculate message attributes for the given message.

**Parameters**

in	<i>message</i>	Message to send
----	----------------	-----------------

**Returns**

[MessageAttributes](#) structure containing encoding type, number of segments, max size of segment and characters left in last segment.

**5.6.1.6.2.15 virtual int telux::tel::ISmsManager::getPhoneId ( ) [pure virtual]**

Get associated phone id for this SMSManager.

**Returns**

PhoneId.

**5.6.1.6.2.16 virtual telux::common::Status telux::tel::ISmsManager::registerListener ( std::weak\_ptr< ISmsListener > *listener* ) [pure virtual]**

Register a listener for Sms events

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ISmsListener</a> object which receives event corresponding to SMS
----	-----------------	--

**Returns**

Status of registerListener i.e. success or suitable error code.

**5.6.1.6.2.17 virtual telux::common::Status telux::tel::ISmsManager::removeListener ( std::weak\_ptr< ISmsListener > *listener* ) [pure virtual]**

Remove a previously added listener.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ISmsListener</a> object
----	-----------------	--

**Returns**

Status of removeListener i.e. success or suitable error code.

### 5.6.1.7 class telux::tel::ISmsListener

A listener class receives notification for the incoming message(s) and delivery report for sent message(s).

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void `onIncomingSms` (int phoneId, std::shared\_ptr< [SmsMessage](#) > message)
- virtual void `onIncomingSms` (int phoneId, std::shared\_ptr< std::vector< [SmsMessage](#) >> messages)
- virtual void `onDeliveryReport` (int phoneId, int msgRef, std::string receiverAddress, [telux::common::ErrorCode](#) error)
- virtual void `onMemoryFull` (int phoneId, [StorageType](#) type)
- virtual `~ISmsListener` ()

#### 5.6.1.7.1 Constructors and Destructors

5.6.1.7.1.1 virtual `telux::tel::ISmsListener::~~ISmsListener` ( ) [`virtual`]

#### 5.6.1.7.2 Member Function Documentation

5.6.1.7.2.1 virtual void `telux::tel::ISmsListener::onIncomingSms` ( int *phoneId*, std::shared\_ptr< [SmsMessage](#) > *message* ) [`virtual`]

This function will be invoked when a single part message is received or when a part of a multi-part message is received. If the SMS preferred storage is to store the SMS in storage i.e SIM then the SMS will be first stored in storage and then this API will be invoked.

#### Parameters

in	<i>phoneId</i>	Unique identifier per SIM slot. Phone on which the message is received.
in	<i>SmsMessage</i>	Pointer to <a href="#">SmsMessage</a> object

5.6.1.7.2.2 virtual void `telux::tel::ISmsListener::onIncomingSms` ( int *phoneId*, std::shared\_ptr< std::vector< [SmsMessage](#) >> *messages* ) [`virtual`]

This function will be invoked when either a single part message is received, or when all the parts of a multipart message have been received. This API is invoked only once all parts of a message are received. In case of a single part message, it will be invoked as soon as it is received. In case of multi-part, the implementation waits for all parts of the message to arrive and then invokes this API. If the SMS preferred storage is to store the SMS in storage i.e SIM then the messages will be first stored in storage and then this API will be invoked.

in	<i>phoneId</i>	Unique identifier per SIM slot. Phone on which the message is received.
in	<i>messages</i>	Pointer to list of <a href="#">SmsMessage</a> received corresponding to single part or all parts of multipart message.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.7.2.3 virtual void telux::tel::ISmsListener::onDeliveryReport ( int *phoneId*, int *msgRef*, std::string *receiverAddress*, telux::common::ErrorCode *error* ) [virtual]

This function will be invoked when either a delivery report for a single part message is received or when the delivery report for part of a multi-part message is received. In order to determine delivery of all parts of the multi-part message, the client application shall compare message reference received in the delivery indications with message references received in [telux::tel::SmsResponseCb](#).

**Parameters**

in	<i>phoneId</i>	Unique identifier per SIM slot. Phone on which the message is received.
in	<i>msgRef</i>	Message reference number (as per spec 3GPP TS 23.040 9.2.2.3) for a single part message or part of multipart message.
in	<i>receiverAddress</i>	Receiver or destination address
in	<i>error</i>	<a href="#">telux::common::ErrorCode</a>

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.6.1.7.2.4 virtual void telux::tel::ISmsListener::onMemoryFull ( int *phoneId*, StorageType *type* ) [virtual]

This function will be invoked when SMS storage is full.

**Parameters**

in	<i>phoneId</i>	Unique identifier per SIM slot. Phone on which the message is received.
in	<i>type</i>	<a href="#">telux::tel::StorageType</a> . Applicable storage type <a href="#">StorageType::SIM</a>

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.6.1.8 class telux::tel::ISmscAddressCallback

Interface for SMS callback object. Client needs to implement this interface to get single shot responses for send SMS.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [smscAddressResponse](#) (const std::string &address, [telux::common::ErrorCode](#) error)=0

#### 5.6.1.8.1 Member Function Documentation

**5.6.1.8.1.1** virtual void [telux::tel::ISmscAddressCallback::smscAddressResponse](#) ( const std::string & *address*, [telux::common::ErrorCode](#) *error* ) [pure virtual]

This function is called with the response to the Smsc address request.

#### Parameters

in	<i>address</i>	Smsc address
in	<i>error</i>	ErrorCode

## 5.6.2 Enumeration Type Documentation

### 5.6.2.1 enum telux::tel::SmsEncoding [strong]

Specifies the encoding of the SMS message.

#### Enumerator

- GSM7** GSM 7-bit default alphabet encoding
- GSM8** GSM 8-bit data encoding
- UCS2** UCS-2 encoding
- UNKNOWN** Unknown encoding

### 5.6.2.2 enum telux::tel::SmsTagType [strong]

Specifies the SMS tag type. All incoming messages will be received and stored with tag as MT\_NOT\_READ. It is the client's responsibility to update the tag to MT\_READ using [telux::tel::ISmsManager::setTag](#) whenever the message is considered read.

#### Enumerator

- UNKNOWN** Unknown tag type
- MT\_READ** MT message marked as read
- MT\_NOT\_READ** MT message marked as not read

### 5.6.2.3 enum telux::tel::DeleteType [strong]

Specifies the type of delete operation to be performed.

#### Enumerator

**UNKNOWN** Unknown delete type

**DELETE\_ALL** Delete all message from memory storage

**DELETE\_MESSAGES\_BY\_TAG** Deletes all messages from the memory storage that match the specific message tag

**DELETE\_MSG\_AT\_INDEX** Deletes only the message at the specific index from the memory storage

### 5.6.2.4 enum telux::tel::StorageType [strong]

Specifies the SMS storage type for incoming message.

#### Enumerator

**UNKNOWN** Unknown storage type

**NONE** This indicates SMS not stored on any of storage and is directly notified to client. This is the default storage type

**SIM** This indicates SMS is stored on SIM

## 5.7 SIM Card Services

This section contains APIs related to Card Services.

### 5.7.1 Data Structure Documentation

#### 5.7.1.1 class telux::tel::ICardApp

Represents a single card application.

##### Public member functions

- virtual [AppType](#) `getAppType ()`=0
- virtual [AppState](#) `getAppState ()`=0
- virtual `std::string` `getAppId ()`=0
- virtual [telux::common::Status](#) `changeCardPassword (CardLockType lockType, std::string oldPwd, std::string newPwd, PinOperationResponseCb callback)`=0
- virtual [telux::common::Status](#) `unlockCardByPuk (CardLockType lockType, std::string puk, std::string newPin, PinOperationResponseCb callback)`=0
- virtual [telux::common::Status](#) `unlockCardByPin (CardLockType lockType, std::string pin, PinOperationResponseCb callback)`=0
- virtual [telux::common::Status](#) `queryPin1LockState (QueryPin1LockResponseCb callback)`=0
- virtual [telux::common::Status](#) `queryFdnLockState (QueryFdnLockResponseCb callback)`=0
- virtual [telux::common::Status](#) `setCardLock (CardLockType lockType, std::string password, bool isEnabled, PinOperationResponseCb callback)`=0
- virtual `~ICardApp ()`

##### 5.7.1.1.1 Constructors and Destructors

5.7.1.1.1.1 virtual `telux::tel::ICardApp::~~ICardApp ( )` [virtual]

##### 5.7.1.1.2 Member Function Documentation

5.7.1.1.2.1 virtual `AppType telux::tel::ICardApp::getAppType ( )` [pure virtual]

Get Application type like SIM, USIM, RUIM, CSIM or ISIM.

##### Returns

[AppType](#).

**5.7.1.1.2.2 virtual AppState telux::tel::ICardApp::getAppState ( ) [pure virtual]**

Get Application state like PIN1, PUK required and others.

**Returns**

[AppState](#).

**5.7.1.1.2.3 virtual std::string telux::tel::ICardApp::getAppld ( ) [pure virtual]**

Get application identifier.

**Returns**

Application Id.

**5.7.1.1.2.4 virtual telux::common::Status telux::tel::ICardApp::changeCardPassword ( CardLockType lockType, std::string oldPwd, std::string newPwd, PinOperationResponseCb callback ) [pure virtual]**

Change the password used in PIN1/PIN2 lock.

**Parameters**

in	<i>lockType</i>	CardLockType. Applicable lock types are PIN1 and PIN2.
in	<i>oldPwd</i>	Old password
in	<i>newPwd</i>	New password
in	<i>callback</i>	Callback function to get the response of change pin password.

**5.7.1.1.2.5 virtual telux::common::Status telux::tel::ICardApp::unlockCardByPuk ( CardLockType lockType, std::string puk, std::string newPin, PinOperationResponseCb callback ) [pure virtual]**

Unlock the Sim card for an app by entering PUK and new pin.

**Parameters**

in	<i>lockType</i>	CardLockType. Applicable lock types are PUK1 and PUK2
in	<i>puk</i>	PUK1/PUK2
in	<i>pin</i>	New PIN1/PIN2
in	<i>callback</i>	Callback function to get the response of unlock card lock.

**5.7.1.1.2.6 virtual telux::common::Status telux::tel::ICardApp::unlockCardByPin ( CardLockType lockType, std::string pin, PinOperationResponseCb callback ) [pure virtual]**

Unlock the Sim card for an app by entering PIN.

in	<i>lockType</i>	CardLockType. Applicable lock types are PIN1 and PIN2.
in	<i>pin</i>	New PIN1/PIN2
in	<i>callback</i>	Callback function to get the response of unlock card lock.

#### 5.7.1.1.2.7 virtual telux::common::Status telux::tel::ICardApp::queryPin1LockState ( QueryPin1Lock↔ ResponseCb *callback* ) [pure virtual]

Query Pin1 lock state.

##### Parameters

in	<i>callback</i>	Callback function to get the response of query pin1 lock state.
----	-----------------	---

#### 5.7.1.1.2.8 virtual telux::common::Status telux::tel::ICardApp::queryFdnLockState ( QueryFdnLock↔ ResponseCb *callback* ) [pure virtual]

Query FDN lock state.

##### Parameters

in	<i>callback</i>	Callback function to get the response of query fdn lock state.
----	-----------------	--

#### 5.7.1.1.2.9 virtual telux::common::Status telux::tel::ICardApp::setCardLock ( CardLockType *lockType*, std::string *password*, bool *isEnabled*, PinOperationResponseCb *callback* ) [pure virtual]

Enable or disable FDN or Pin1 lock.

##### Parameters

in	<i>lockType</i>	CardLockType. Applicable lock type such as PIN1 and FDN
in	<i>password</i>	Password of PIN1 and FDN
in	<i>isEnabled</i>	If true then enable else disable.
in	<i>callback</i>	Callback function to get the response of set card lock.

### 5.7.1.2 struct telux::tel::lccResult

The APDU response with status for transmit APDU operation.

#### Public member functions

- const std::string [toString](#) () const

#### Data Fields

- int [sw1](#)
- int [sw2](#)

- `std::string` [payload](#)
- `std::vector< int >` [data](#)

### 5.7.1.2.1 Member Function Documentation

#### 5.7.1.2.1.1 `const std::string telux::tel::lccResult::toString ( ) const`

### 5.7.1.2.2 Field Documentation

#### 5.7.1.2.2.1 `int telux::tel::lccResult::sw1`

Status word 1 for command processing status

#### 5.7.1.2.2.2 `int telux::tel::lccResult::sw2`

Status word 2 for command processing qualifier

#### 5.7.1.2.2.3 `std::string telux::tel::lccResult::payload`

response as a hex string

#### 5.7.1.2.2.4 `std::vector<int> telux::tel::lccResult::data`

vector of raw data received as part of response to the card services request

### 5.7.1.3 class `telux::tel::ICardManager`

[ICardManager](#) provide APIs for slot count, retrieve slot ids, get card state and get card.

#### Public member functions

- virtual `bool` [isSubsystemReady](#) ()=0
- virtual `std::future< bool >` [onSubsystemReady](#) ()=0
- virtual `telux::common::Status` [getSlotCount](#) (int &count)=0
- virtual `telux::common::Status` [getSlotIds](#) (std::vector< int > &slotIds)=0
- virtual `std::shared_ptr< ICard >` [getCard](#) (int slotId=DEFAULT\_SLOT\_ID, `telux::common::Status` \*status=nullptr)=0
- virtual `telux::common::Status` [cardPowerUp](#) (SlotId slotId, `telux::common::ResponseCallback` callback=nullptr)=0
- virtual `telux::common::Status` [cardPowerDown](#) (SlotId slotId, `telux::common::ResponseCallback` callback=nullptr)=0
- virtual `telux::common::Status` [registerListener](#) (std::shared\_ptr< [ICardListener](#) > listener)=0
- virtual `telux::common::Status` [removeListener](#) (std::shared\_ptr< [ICardListener](#) > listener)=0

- virtual `~ICardManager ()`

### 5.7.1.3.1 Constructors and Destructors

5.7.1.3.1.1 virtual `telux::tel::ICardManager::~ICardManager ( ) [virtual]`

### 5.7.1.3.2 Member Function Documentation

5.7.1.3.2.1 virtual `bool telux::tel::ICardManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of telephony subsystems and returns the result.

#### Returns

If true then CardManager is ready for service.

5.7.1.3.2.2 virtual `std::future<bool> telux::tel::ICardManager::onSubsystemReady ( ) [pure virtual]`

Wait for telephony subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when card manager is ready.

5.7.1.3.2.3 virtual `telux::common::Status telux::tel::ICardManager::getSlotCount ( int & count ) [pure virtual]`

Get SIM slot count.

#### Parameters

out	<i>count</i>	SIM slot count.
-----	--------------	-----------------

#### Returns

Status of `getSlotCount` i.e. success or suitable status code.

5.7.1.3.2.4 virtual `telux::common::Status telux::tel::ICardManager::getSlotIds ( std::vector< int > & slotIds ) [pure virtual]`

Get list of SIM slots.

#### Parameters

out	<i>slotIds</i>	List of SIM slot ids.
-----	----------------	-----------------------

**Returns**

Status of getSlotIds i.e. success or suitable status code.

**5.7.1.3.2.5** `virtual std::shared_ptr<ICard> telux::tel::ICardManager::getCard ( int slotId = DEFAULT_SLOT_ID, telux::common::Status * status = nullptr ) [pure virtual]`

Get the Card corresponding to SIM slot.

**Parameters**

in	<i>slotId</i>	Slot id corresponding to the card.
out	<i>status</i>	Status of getCard i.e. success or suitable status code.

**Returns**

Pointer to [ICard](#) object.

**5.7.1.3.2.6** `virtual telux::common::Status telux::tel::ICardManager::cardPowerUp ( SlotId slotId, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Power on the SIM card.

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card which needs to be powered up.
in	<i>callback</i>	Optional callback pointer to get the result of cardPowerUp

**Returns**

Status of cardPowerUp i.e. success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.7.1.3.2.7** `virtual telux::common::Status telux::tel::ICardManager::cardPowerDown ( SlotId slotId, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Power off the SIM card. When the SIM card is powered down, the card state is absent and the SIM IO operations, PIN management API's like unlock card by pin, change card pin will fail.

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card which needs to be powered down.
in	<i>callback</i>	Optional callback pointer to get the result of CardPowerDown

**Returns**

Status of cardPowerDown i.e. success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.7.1.3.2.8 virtual telux::common::Status telux::tel::ICardManager::registerListener ( std::shared\_ptr< ICardListener > *listener* ) [pure virtual]

Register a listener for card events.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ICardListener</a> object that processes the notification.
----	-----------------	--

**Returns**

Status of registerListener i.e. success or suitable status code.

#### 5.7.1.3.2.9 virtual telux::common::Status telux::tel::ICardManager::removeListener ( std::shared\_ptr< ICardListener > *listener* ) [pure virtual]

Remove a previously added listener.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ICardListener</a> object that needs to be removed.
----	-----------------	---

**Returns**

Status of removeListener i.e. success or suitable status code.

### 5.7.1.4 class telux::tel::ICard

[ICard](#) represents currently inserted UICC or eUICC.

**Public member functions**

- virtual [telux::common::Status getState](#) ([CardState](#) &cardState)=0
- virtual std::vector< std::shared\_ptr< [ICardApp](#) > > [getApplications](#) ([telux::common::Status](#) \*status=nullptr)=0
- virtual [telux::common::Status openLogicalChannel](#) (std::string applicationId, std::shared\_ptr< [ICardChannelCallback](#) > callback=nullptr)=0
- virtual [telux::common::Status closeLogicalChannel](#) (int channelId, std::shared\_ptr< [telux::common::ICommandResponseCallback](#) > callback=nullptr)=0

- virtual `telux::common::Status transmitApuLogicalChannel` (int channel, uint8\_t cla, uint8\_t instruction, uint8\_t p1, uint8\_t p2, uint8\_t p3, std::vector< uint8\_t > data, std::shared\_ptr< [ICardCommandCallback](#) > callback=nullptr)=0
- virtual `telux::common::Status transmitApuBasicChannel` (uint8\_t cla, uint8\_t instruction, uint8\_t p1, uint8\_t p2, uint8\_t p3, std::vector< uint8\_t > data, std::shared\_ptr< [ICardCommandCallback](#) > callback=nullptr)=0
- virtual `telux::common::Status exchangeSimIO` (uint16\_t fileId, uint8\_t command, uint8\_t p1, uint8\_t p2, uint8\_t p3, std::string filePath, std::vector< uint8\_t > data, std::string pin2, std::string aid, std::shared\_ptr< [ICardCommandCallback](#) > callback=nullptr)=0
- virtual int `getSlotId` ()=0
- virtual `telux::common::Status requestEid` ([EidResponseCallback](#)=nullptr)=0

#### 5.7.1.4.1 Member Function Documentation

##### 5.7.1.4.1.1 virtual `telux::common::Status telux::tel::ICard::getState ( CardState & cardState ) [pure virtual]`

Get the card state for the slot id.

#### Parameters

out	<i>cardState</i>	<a href="#">CardState</a> - state of the card.
-----	------------------	--

#### Returns

Status of `getCardState` i.e. success or suitable status code.

##### 5.7.1.4.1.2 virtual `std::vector<std::shared_ptr<ICardApp> > telux::tel::ICard::getApplications ( telux::common::Status * status = nullptr ) [pure virtual]`

Get card applications.

#### Parameters

out	<i>status</i>	Status of <code>getApplications</code> i.e. success or suitable status code.
-----	---------------	--

#### Returns

List of card applications.

##### 5.7.1.4.1.3 virtual `telux::common::Status telux::tel::ICard::openLogicalChannel ( std::string applicationId, std::shared_ptr< ICardChannelCallback > callback = nullptr ) [pure virtual]`

Open a logical channel to the SIM.

in	<i>applicationId</i>	Application Id.
in	<i>callback</i>	Optional callback pointer to get the response of open logical channel request.

**Returns**

Status of openLogicalChannel i.e. success or suitable status code.

```
5.7.1.4.1.4 virtual telux::common::Status telux::tel::ICard::closeLogicalChannel ( int channelId,
std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr )
[pure virtual]
```

Close a previously opened logical channel to the SIM.

**Parameters**

in	<i>channelId</i>	The channel ID to be closed.
in	<i>callback</i>	Optional callback pointer to get the response of close logical channel request.

**Returns**

Status of closeLogicalChannel i.e. success or suitable status code.

```
5.7.1.4.1.5 virtual telux::common::Status telux::tel::ICard::transmitApduLogicalChannel ( int channel,
uint8_t cla, uint8_t instruction, uint8_t p1, uint8_t p2, uint8_t p3, std::vector< uint8_t
> data, std::shared_ptr< ICardCommandCallback > callback = nullptr ) [pure
virtual]
```

Transmit an APDU to the ICC card over a logical channel.

**Parameters**

in	<i>channel</i>	Channel Id of the channel to use for communication. Has to be greater than zero.
in	<i>cla</i>	Class of the APDU command.
in	<i>instruction</i>	Instruction of the APDU command.
in	<i>p1</i>	Instruction Parameter 1 value of the APDU command.
in	<i>p2</i>	Instruction Parameter 2 value of the APDU command.
in	<i>p3</i>	Number of bytes present in the data field of the APDU command. If p3 is negative, a 4 byte APDU is sent to the SIM.
in	<i>data</i>	Data to be sent with the APDU.
in	<i>callback</i>	Optional callback pointer to get the response of transmit APDU request.

**Returns**

Status of transmitApduLogicalChannel i.e. success or suitable status code.

**5.7.1.4.1.6** `virtual telux::common::Status telux::tel::ICard::transmitApduBasicChannel ( uint8_t cla, uint8_t instruction, uint8_t p1, uint8_t p2, uint8_t p3, std::vector< uint8_t > data, std::shared_ptr< ICardCommandCallback > callback = nullptr ) [pure virtual]`

Exchange APDUs with the SIM on a basic channel.

#### Parameters

in	<i>cla</i>	Class of the APDU command.
in	<i>instruction</i>	Instruction of the APDU command.
in	<i>p1</i>	Instruction Param1 value of the APDU command.
in	<i>p2</i>	Instruction Param1 value of the APDU command.
in	<i>p3</i>	Number of bytes present in the data field of the APDU command. If p3 is negative, a 4 byte APDU is sent to the SIM.
in	<i>data</i>	Data to be sent with the APDU.
in	<i>callback</i>	Optional callback pointer to get the response of transmit APDU request.

#### Returns

Status of `transmitApduBasicChannel` i.e. success or suitable status code.

**5.7.1.4.1.7** `virtual telux::common::Status telux::tel::ICard::exchangeSimIO ( uint16_t fileId, uint8_t command, uint8_t p1, uint8_t p2, uint8_t p3, std::string filePath, std::vector< uint8_t > data, std::string pin2, std::string aid, std::shared_ptr< ICardCommandCallback > callback = nullptr ) [pure virtual]`

Performs SIM IO operation, This is similar to the TS 27.007 "restricted SIM" operation where it assumes all of the EF selection will be done by the callee

#### Parameters

in	<i>fileId</i>	Elementary File Identifier
in	<i>command</i>	APDU Command for SIM IO operation
in	<i>p1</i>	Instruction Param1 value of the APDU command
in	<i>p2</i>	Instruction Param2 value of the APDU command
in	<i>p3</i>	Number of bytes present in the data field of APDU command. If p3 is negative, a 4 byte APDU is sent to the SIM.
in	<i>filePath</i>	Path of the file
in	<i>data</i>	Data to be sent with the APDU, send empty or null string in case no data
in	<i>pin2</i>	Pin value of the SIM. Invalid attempt of PIN2 value will lock the SIM. send empty or null string in case of no Pin2 value
in	<i>aid</i>	Application identifier, send empty or null string in case of no aid
in	<i>callback</i>	Optional callback pointer to get the response of SIM IO request

**Returns**

- Status of exchangeSimIO i.e. success or suitable status code

**5.7.1.4.1.8 virtual int telux::tel::ICard::getSlotId ( ) [pure virtual]**

Get associated slot id for [ICard](#)

**Returns**

SlotId

**5.7.1.4.1.9 virtual telux::common::Status telux::tel::ICard::requestEid ( EidResponseCallback = nullptr ) [pure virtual]**

Request eUICC identifier of eUICC card.

**Parameters**

in	<i>callback</i>	Callback function to get the result of request eid.
----	-----------------	---

**Returns**

Status of request eid i.e. success or suitable error code.

**Dependencies card should be eUICC capable**

**5.7.1.5 class telux::tel::ICardChannelCallback**

Interface for Card callback object. Client needs to implement this interface to get single shot responses for commands like open logical channel and close logical channel.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onChannelResponse](#) (int channel, [IccResult](#) result, [telux::common::ErrorCode](#) error)=0

**5.7.1.5.1 Member Function Documentation****5.7.1.5.1.1 virtual void telux::tel::ICardChannelCallback::onChannelResponse ( int channel, IccResult result, telux::common::ErrorCode error ) [pure virtual]**

This function is called with the response to the open logical channel operation.

in	<i>channel</i>	Channel Id for the logical channel.
in	<i>result</i>	<a href="#">IccResult</a> of open logical channel.
in	<i>error</i>	ErrorCode of the request.

### 5.7.1.6 class telux::tel::ICardCommandCallback

#### Public member functions

- virtual void [onResponse](#) ([IccResult](#) result, [telux::common::ErrorCode](#) error)=0

#### 5.7.1.6.1 Member Function Documentation

**5.7.1.6.1.1 virtual void telux::tel::ICardCommandCallback::onResponse ( [IccResult](#) *result*, [telux::common::ErrorCode](#) *error* ) [pure virtual]**

This function is called when SIM Card transmit APDU over Logical, Basic Channel and Exchange Sim IO.

#### Parameters

in	<i>result</i>	<a href="#">IccResult</a> of transmit APDU command
in	<i>error</i>	ErrorCode of the request, Possible error codes are <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• INTERNAL</li> <li>• NO_MEMORY</li> <li>• INVALID_ARG</li> <li>• MISSING_ARG</li> </ul>

### 5.7.1.7 class telux::tel::ICardListener

Interface for SIM Card Listener object. Client needs to implement this interface to get access to card services notifications on card state change.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onCardInfoChanged](#) (int slotId)
- virtual [~ICardListener](#) ()

#### 5.7.1.7.1 Constructors and Destructors

**5.7.1.7.1.1 virtual telux::tel::ICardListener::~~ICardListener ( ) [virtual]**

### 5.7.1.7.2 Member Function Documentation

#### 5.7.1.7.2.1 virtual void telux::tel::ICardListener::onCardInfoChanged ( int slotId ) [virtual]

This function is called when info of card gets updated.

#### Parameters

in	slotId	Slot identifier.
----	--------	------------------

### 5.7.1.8 struct telux::tel::CardReaderStatus

Structure contains identity of card reader status

#### Data fields

Type	Field	Description
int	id	Card Reader ID
bool	isRemovable	Card reader is removable
bool	isPresent	Card reader is present
bool	isID1size	Card reader present is ID-1 size
bool	isCardPresent	Card is present in reader
bool	isCard↔ PoweredOn	Card in reader is powered

### 5.7.1.9 class telux::tel::ISapCardManager

[ISapCardManager](#) provide APIs for SAP related operations.

#### Public member functions

- virtual bool [isReady](#) ()=0
- virtual std::future< bool > [onReady](#) ()=0
- virtual [telux::common::Status](#) [getState](#) (SapState &sapState)=0
- virtual [telux::common::Status](#) [requestSapState](#) (SapStateResponseCallback callback)=0

- virtual `~ISapCardManager` ()

### 5.7.1.9.1 Constructors and Destructors

5.7.1.9.1.1 virtual `telux::tel::ISapCardManager::~ISapCardManager` ( ) [`virtual`]

### 5.7.1.9.2 Member Function Documentation

5.7.1.9.2.1 virtual `bool telux::tel::ISapCardManager::isReady` ( ) [`pure virtual`]

Checks the status of SIM access profile(SAP) subsystem and returns the result.

#### Returns

If true then SapCardManager is ready for service.

5.7.1.9.2.2 virtual `std::future<bool> telux::tel::ISapCardManager::onReady` ( ) [`pure virtual`]

Wait for IM access profile(SAP) subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when card manager is ready.

5.7.1.9.2.3 virtual `telux::common::Status telux::tel::ISapCardManager::getState` ( `SapState & sapState` ) [`pure virtual`]

Get SIM access profile (SAP) client connection state.

#### Parameters

out	<i>sapState</i>	<code>SapState</code> of the SIM Card
-----	-----------------	---------------------------------------

**Returns**

Status of getState i.e. success or suitable status code.

**Deprecated** Use [requestSapState\(\)](#) API below to get SAP state

**5.7.1.9.2.4** `virtual telux::common::Status telux::tel::ISapCardManager::requestSapState ( SapStateResponseCallback callback ) [pure virtual]`

Get SIM access profile(SAP) client connection state.

**Parameters**

out	<i>callback</i>	Callback function pointer to get the response of requestSapState.
-----	-----------------	---

**Returns**

Status of requestSapState i.e. success or suitable status code.

**5.7.1.9.2.5** `virtual telux::common::Status telux::tel::ISapCardManager::openConnection ( SapCondition sapCondition = SapCondition::SAP_CONDITION_BLOCK_VOICE_OR_DATA, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Establishes SIM access profile (SAP) client connection with SIM Card.

**Parameters**

in	<i>sapCondition</i>	Condition to enable sap connection.
in	<i>callback</i>	Optional callback to get the response of open sap connection request or possible error codes i.e. <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• INTERNAL</li> <li>• NO_MEMORY</li> <li>• INVALID_ARG</li> <li>• MISSING_ARG</li> </ul>

**Returns**

Status of openConnection i.e. success or suitable status code.

**5.7.1.9.2.6** `virtual telux::common::Status telux::tel::ISapCardManager::closeConnection ( std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Releases a SAP connection to SIM Card.

in	<i>callback</i>	Optional callback to get the response of close sap connection request or possible error codes i.e. <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• INTERNAL</li> <li>• NO_MEMORY</li> <li>• INVALID_ARG</li> <li>• MISSING_ARG</li> </ul>
----	-----------------	---

**Returns**

Status of closeConnection i.e. success or suitable status code

**5.7.1.9.2.7** virtual telux::common::Status telux::tel::ISapCardManager::requestAtr ( std::shared\_ptr< IAtrResponseCallback > *callback = nullptr* ) [pure virtual]

Request for SAP Answer To Reset command.

**Parameters**

in	<i>callback</i>	Optional callback to get the response of requestAtr.
----	-----------------	--

**Returns**

Status of requestAtr i.e. success or suitable status code.

**5.7.1.9.2.8** virtual telux::common::Status telux::tel::ISapCardManager::transmitApdu ( uint8\_t *cla*, uint8\_t *instruction*, uint8\_t *p1*, uint8\_t *p2*, uint8\_t *lc*, std::vector< uint8\_t > *data*, uint8\_t *le* = 0, std::shared\_ptr< ISapCardCommandCallback > *callback = nullptr* ) [pure virtual]

Send the Apdu on SAP mode.

**Parameters**

in	<i>cla</i>	Class of the APDU command.
in	<i>instruction</i>	Instruction of the APDU command.
in	<i>p1</i>	Instruction Parameter 1 value of the APDU command.
in	<i>p2</i>	Instruction Parameter 1 value of the APDU command.
in	<i>lc</i>	Number of bytes present in the data field of the APDU command. If lc is negative, a 4 byte APDU is sent to the SIM.
in	<i>data</i>	List of data to be sent with the APDU.
in	<i>le</i>	Maximum number of bytes expected in the data field of the response to the command.
in	<i>callback</i>	Optional callback to send APDU in SAP mode.

**Returns**

Status of transmitApdu i.e. success or suitable status code.

**5.7.1.9.2.9** virtual telux::common::Status telux::tel::ISapCardManager::requestSimPowerOff ( std::shared\_ptr< telux::common::ICommandResponseCallback > *callback = nullptr* ) [pure virtual]

Send the SAP SIM power off request.

#### Parameters

in	<i>callback</i>	Optional callback to get the response for SIM power off.
----	-----------------	--

#### Returns

Status of requestSimPowerOff i.e. success or suitable status code.

**5.7.1.9.2.10** virtual telux::common::Status telux::tel::ISapCardManager::requestSimPowerOn ( std::shared\_ptr< telux::common::ICommandResponseCallback > *callback = nullptr* ) [pure virtual]

Send the SAP SIM power on request.

#### Parameters

in	<i>callback</i>	Optional callback to get the response for SIM power on.
----	-----------------	---

#### Returns

Status of requestSimPowerOn i.e. success or suitable status code.

**5.7.1.9.2.11** virtual telux::common::Status telux::tel::ISapCardManager::requestSimReset ( std::shared\_ptr< telux::common::ICommandResponseCallback > *callback = nullptr* ) [pure virtual]

Send the SAP SIM reset request.

#### Parameters

in	<i>callback</i>	Optional callback to get the response for SIM reset
----	-----------------	---

#### Returns

Status of requestSimReset i.e. success or suitable status code.

**5.7.1.9.2.12** virtual telux::common::Status telux::tel::ISapCardManager::requestCardReaderStatus ( std::shared\_ptr< ICardReaderCallback > *callback = nullptr* ) [pure virtual]

Send the SAP Card Reader Status request command.

<i>in</i>	<i>callback</i>	Optional callback to get the response for card reader status
-----------	-----------------	--

**Returns**

Status of requestCardReaderStatus i.e. success or suitable status code.

#### 5.7.1.9.2.13 `virtual int telux::tel::ISapCardManager::getSlotId ( ) [pure virtual]`

Get associated slot id for the SapCardManager.

**Returns**

SlotId

#### 5.7.1.9.2.14 `virtual telux::common::Status telux::tel::ISapCardManager::registerListener ( std::shared_ptr< ISapCardListener > listener ) [pure virtual]`

Register a listener for SAP events.

**Parameters**

<i>in</i>	<i>listener</i>	Pointer to <a href="#">ISapCardListener</a> object that processes the notification.
-----------	-----------------	---

**Returns**

Status of registerListener i.e. success or suitable status code.

#### 5.7.1.9.2.15 `virtual telux::common::Status telux::tel::ISapCardManager::removeListener ( std::shared_ptr< ISapCardListener > listener ) [pure virtual]`

Remove a previously added listener.

**Parameters**

<i>in</i>	<i>listener</i>	Pointer to <a href="#">ISapCardListener</a> object that needs to be removed.
-----------	-----------------	--

**Returns**

Status of removeListener i.e. success or suitable status code.

### 5.7.1.10 `class telux::tel::IAtrResponseCallback`

**Public member functions**

- virtual void [atrResponse](#) (std::vector< int > responseAtr, [telux::common::ErrorCode](#) error)=0

### 5.7.1.10.1 Member Function Documentation

**5.7.1.10.1.1** virtual void `telux::tel::IAtrResponseCallback::atrResponse ( std::vector< int > responseAtr, telux::common::ErrorCode error ) [pure virtual]`

This function is called in response to requestAtr() request.

#### Parameters

in	<i>responseAtr</i>	response ATR values
in	<i>error</i>	ErrorCode of the request possible error codes are <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• INTERNAL</li> <li>• NO_MEMORY</li> <li>• INVALID_ARG</li> <li>• MISSING_ARG</li> </ul>

### 5.7.1.11 class telux::tel::ISapCardCommandCallback

#### Public member functions

- virtual void `onResponse (IccResult result, telux::common::ErrorCode error)=0`

### 5.7.1.11.1 Member Function Documentation

**5.7.1.11.1.1** virtual void `telux::tel::ISapCardCommandCallback::onResponse ( IccResult result, telux::common::ErrorCode error ) [pure virtual]`

This function is called when SIM Card transmit APDU on SAP mode.

#### Parameters

in	<i>result</i>	<a href="#">IccResult</a> of transmit APDU command
in	<i>error</i>	ErrorCode of the request, possible error codes are <ul style="list-style-type: none"> <li>• <a href="#">SUCCESS</a></li> <li>• INTERNAL</li> <li>• NO_MEMORY</li> <li>• INVALID_ARG</li> <li>• MISSING_ARG</li> </ul>

### 5.7.1.12 class telux::tel::ICardReaderCallback

#### Public member functions

- virtual void `cardReaderResponse (CardReaderStatus cardReaderStatus, telux::common::ErrorCode error)=0`

### 5.7.1.12.1 Member Function Documentation

**5.7.1.12.1.1** `virtual void telux::tel::ICardReaderCallback::cardReaderResponse ( CardReaderStatus cardReaderStatus, telux::common::ErrorCode error ) [pure virtual]`

This function is called in response to requestCardReaderStatus() method.

#### Parameters

in	<i>cardReaderStatus</i>	Structure contains the identity of the card reader
in	<i>error</i>	ErrorCode of the request

### 5.7.1.13 class telux::tel::ISapCardListener

Interface for SAP Listener object. Client needs to implement this interface to get access to SAP service notifications like service status change.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual `~ISapCardListener ()`

### 5.7.1.13.1 Constructors and Destructors

**5.7.1.13.1.1** `virtual telux::tel::ISapCardListener::~~ISapCardListener ( ) [virtual]`

## 5.7.2 Enumeration Type Documentation

### 5.7.2.1 enum telux::tel::CardState [strong]

Defines all state of Card like absent, present etc

#### Enumerator

***CARDSTATE\_UNKNOWN*** Unknown card state  
***CARDSTATE\_ABSENT*** Card is absent  
***CARDSTATE\_PRESENT*** Card is present  
***CARDSTATE\_ERROR*** Card is having error, either card is removed and not readable  
***CARDSTATE\_RESTRICTED*** Card is present but not usable due to carrier restrictions.

### 5.7.2.2 enum telux::tel::CardError [strong]

Defines the reasons for error in CardState

#### Enumerator

***UNKNOWN*** Unknown error  
***POWER\_DOWN*** Power down

**POLL\_ERROR** Poll error  
**NO\_ATR\_RECEIVED** No ATR received  
**VOLT\_MISMATCH** Volt mismatch  
**PARITY\_ERROR** Parity error  
**POSSIBLY\_REMOVED** Unknown, possibly removed  
**TECHNICAL\_PROBLEMS** Card returned technical problems  
**NULL\_BYTES** Card returned NULL bytes  
**SAP\_CONNECTED** Terminal in SAP mode  
**CMD\_TIMEOUT** Command timeout error

### 5.7.2.3 enum telux::tel::CardLockType [strong]

Defines all types of card locks which uses in PIN management APIs

#### Enumerator

**PIN1** Lock type is PIN1  
**PIN2** Lock type is PIN2  
**PUK1** Lock type is Pin Unblocking Key1  
**PUK2** Lock type is Pin Unblocking Key2  
**FDN** Lock type is Fixed Dialing Number

### 5.7.2.4 enum telux::tel::AppType

Defines all type of UICC application such as SIM, RUIM, USIM, CSIM and ISIM.

#### Enumerator

**APPTYPE\_UNKNOWN** Unknown application type  
**APPTYPE\_SIM** UICC application type is SIM  
**APPTYPE\_USIM** UICC application type is USIM  
**APPTYPE\_RUIM** UICC application type is RSIM  
**APPTYPE\_CSIM** UICC application type is CSIM  
**APPTYPE\_ISIM** UICC application type is ISIM

### 5.7.2.5 enum telux::tel::AppState

Defines all application states.

#### Enumerator

**APPSTATE\_UNKNOWN** Unknown application state  
**APPSTATE\_DETECTED** application state detected  
**APPSTATE\_PIN** If PIN1 or UPin is required  
**APPSTATE\_PUK** If PUK1 or Puk for UPin is required  
**APPSTATE\_SUBSCRIPTION\_PERSO** PersoSubstate should be look at when application state is assigned to this value  
**APPSTATE\_READY** application State is ready

### 5.7.2.6 enum telux::tel::SapState [strong]

Defines all SIM access profile (SAP) connection states.

#### Enumerator

**SAP\_STATE\_NOT\_ENABLED** SAP connection not enabled  
**SAP\_STATE\_CONNECTING** SAP State is connecting  
**SAP\_STATE\_CONNECTED\_SUCCESSFULLY** SAP connection is successful  
**SAP\_STATE\_CONNECTION\_ERROR** SAP connection error  
**SAP\_STATE\_DISCONNECTING** SAP state is disconnecting  
**SAP\_STATE\_DISCONNECTED\_SUCCESSFULLY** SAP state disconnection is successful

### 5.7.2.7 enum telux::tel::SapCondition [strong]

Indicates type of connection required, default behavior is to block a SAP connection when a voice or data call is active.

#### Enumerator

**SAP\_CONDITION\_BLOCK\_VOICE\_OR\_DATA** Block a SAP connection when a voice or data call is active (Default)  
**SAP\_CONDITION\_BLOCK\_DATA** Block a SAP connection when a data call is active  
**SAP\_CONDITION\_BLOCK\_VOICE** Block a SAP connection when a voice call is active  
**SAP\_CONDITION\_BLOCK\_NONE** Allow Sap connection in all cases

## 5.8 Cell Broadcast

This section contains APIs related to configure, activate and receive 3GPP ETWS/CMAS cell broadcast messages.

### 5.8.1 Data Structure Documentation

#### 5.8.1.1 struct telux::tel::CellBroadcastFilter

Defines cellbroadcast message filter. Refer spec 3GPP TS 23.041 9.4.1.2.2 for message identifier. Eg: If user want to receive from 0x1112 to 0x1116 then, startMessageId is 0x1112 and endMessageId is 0x1116. If user want to receive only 0x1112, then both startMessageId and endMessageId is 0x1112.

##### Data fields

Type	Field	Description
int	startMessageId	Intended to receive start from which MessageType
int	endMessageId	Intended to receive upto which MessageType

#### 5.8.1.2 struct telux::tel::Point

[Point](#) represented by latitude and longitude.

##### Data fields

Type	Field	Description
double	latitude	
double	longitude	

#### 5.8.1.3 class telux::tel::Polygon

This class represents a simple polygon with different points.

##### Public member functions

- [Polygon](#) (std::vector< [Point](#) > vertices)
- std::vector< [Point](#) > [getVertices](#) ()

#### 5.8.1.3.1 Constructors and Destructors

##### 5.8.1.3.1.1 telux::tel::Polygon::Polygon ( std::vector< Point > vertices )

[Polygon](#) constructor.

##### Parameters

in	<i>vertices</i>	List of <a href="#">telux::tel::Point</a>
----	-----------------	---

### 5.8.1.3.2 Member Function Documentation

#### 5.8.1.3.2.1 `std::vector<Point> telux::tel::Polygon::getVertices ( )`

Get vertices of polygon.

#### Returns

List of [telux::tel::Point](#).

### 5.8.1.4 class `telux::tel::Circle`

This class represents a geometry represented as simple circle.

#### Public member functions

- [Circle](#) ([Point](#) center, double radius)
- [Point](#) `getCenter` ( )
- double `getRadius` ( )

#### 5.8.1.4.1 Constructors and Destructors

##### 5.8.1.4.1.1 `telux::tel::Circle::Circle ( Point center, double radius )`

[Circle](#) constructor.

#### Parameters

in	<i>center</i>	Center of circle represented by <a href="#">telux::tel::Point</a>
in	<i>radius</i>	Radius of circle in meters

#### 5.8.1.4.2 Member Function Documentation

##### 5.8.1.4.2.1 `Point telux::tel::Circle::getCenter ( )`

Get center point of circle.

#### Returns

Center of circle.

##### 5.8.1.4.2.2 `double telux::tel::Circle::getRadius ( )`

Get radius of circle.

#### Returns

Radius of circle.

### 5.8.1.5 class telux::tel::Geometry

This class represents warning area geometry to perform geofencing on alert.

#### Public member functions

- [Geometry](#) (std::shared\_ptr< [Polygon](#) > polygon)
- [Geometry](#) (std::shared\_ptr< [Circle](#) > circle)
- [GeometryType](#) [getType](#) () const
- std::shared\_ptr< [Polygon](#) > [getPolygon](#) () const
- std::shared\_ptr< [Circle](#) > [getCircle](#) () const

#### 5.8.1.5.1 Constructors and Destructors

##### 5.8.1.5.1.1 telux::tel::Geometry::Geometry ( std::shared\_ptr< [Polygon](#) > *polygon* )

[Geometry](#) constructor.

#### Parameters

in	<i>polygon</i>	<a href="#">Polygon</a>
----	----------------	-------------------------

##### 5.8.1.5.1.2 telux::tel::Geometry::Geometry ( std::shared\_ptr< [Circle](#) > *circle* )

[Geometry](#) constructor.

#### Parameters

in	<i>circle</i>	<a href="#">Circle</a>
----	---------------	------------------------

#### 5.8.1.5.2 Member Function Documentation

##### 5.8.1.5.2.1 GeometryType telux::tel::Geometry::getType ( ) const

Get the geometry type.

#### Returns

[GeometryType](#).

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.8.1.5.2.2 `std::shared_ptr<Polygon> telux::tel::Geometry::getPolygon ( ) const`

Get polygon geometry as warning area to perform geofencing. This method should be called only if geometry type returned by `getType()` API is `GeometryType::POLYGON`

##### Returns

`Polygon` geometry object.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.8.1.5.2.3 `std::shared_ptr<Circle> telux::tel::Geometry::getCircle ( ) const`

Get circle geometry as warning area to perform geofencing. This method should be called only if geometry type returned by `getType()` API is `GeometryType::CIRCLE`

##### Returns

`Circle` geometry object.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.8.1.6 `class telux::tel::WarningAreaInfo`

This class represents warning area information for alert.

#### Public member functions

- `WarningAreaInfo` (int `maxWaitTime`, `std::vector< Geometry > geometries`)
- int `getGeoFenceMaxWaitTime` ()
- `std::vector< Geometry > getGeometries` ()

#### 5.8.1.6.1 Constructors and Destructors

##### 5.8.1.6.1.1 `telux::tel::WarningAreaInfo::WarningAreaInfo ( int maxWaitTime, std::vector< Geometry > geometries )`

Warning Area Information constructor.

**Parameters**

in	<i>maxWaitTime</i>	Maximum wait time allowed to determine position for alert Range is 0 to 255 where 0 means Zero wait time, 1 - 254 is Geo-Fencing Maximum Wait Time in seconds and 255 means use device default wait time.
in	<i>geometries</i>	Geometries to perform geofencing on alert

**5.8.1.6.2 Member Function Documentation****5.8.1.6.2.1 int telux::tel::WarningAreaInfo::getGeoFenceMaxWaitTime ( )**

Get maximum wait time allowed to determine position for alert.

**Returns**

Maximum wait time for alert in seconds.

**5.8.1.6.2.2 std::vector<Geometry> telux::tel::WarningAreaInfo::getGeometries ( )**

Get geometries to perform geofencing on alert.

**Returns**

List of [telux::tel::Geometry](#).

**5.8.1.7 class telux::tel::EtwsInfo**

Contains information elements for a GSM/UMTS/E-UTRAN/NG-RAN ETWS warning notification. Supported values for each element are defined in 3GPP TS 23.041.

**Public member functions**

- [EtwsInfo](#) ([GeographicalScope](#) geographicalScope, int msgId, int serialNumber, std::string languageCode, std::string messageText, [MessagePriority](#) priority, [EtwsWarningType](#) warningType, bool emergencyUserAlert, bool activatePopup, bool primary, std::vector< uint8\_t > warningSecurityInformation)
- [GeographicalScope](#) [getGeographicalScope](#) () const
- int [getMessageId](#) () const
- int [getSerialNumber](#) () const
- std::string [getLanguageCode](#) () const
- std::string [getMessageBody](#) () const
- [MessagePriority](#) [getPriority](#) () const
- int [getMessageCode](#) () const

- int [getUpdateNumber](#) () const
- [EtwsWarningType](#) [getEtwsWarningType](#) ()
- bool [isEmergencyUserAlert](#) ()
- bool [isPopupAlert](#) ()
- bool [isPrimary](#) ()
- std::vector< uint8\_t > [getWarningSecurityInformation](#) ()

### 5.8.1.7.1 Constructors and Destructors

**5.8.1.7.1.1** `telux::tel::EtwsInfo::EtwsInfo ( GeographicalScope geographicalScope, int msgId, int serialNumber, std::string languageCode, std::string messageText, MessagePriority priority, EtwsWarningType warningType, bool emergencyUserAlert, bool activatePopup, bool primary, std::vector< uint8_t > warningSecurityInformation )`

[EtwsInfo](#) constructor.

#### Parameters

in	<i>geographicalScope</i>	<a href="#">GeographicalScope</a>
in	<i>msgId</i>	Unique message identifier
in	<i>serialNumber</i>	Serial number for message
in	<i>languageCode</i>	ISO-639-1 language code for message
in	<i>messageText</i>	Message text
in	<i>priority</i>	<a href="#">MessagePriority</a>
in	<i>warningType</i>	<a href="#">EtwsWarningType</a>
in	<i>emergencyUserAlert</i>	If true message is emergency user alert otherwise not
in	<i>activatePopup</i>	If true message message activate popup flag is set, otherwise popup flag is false.
in	<i>primary</i>	If true ETWS message is primary notification otherwise not
in	<i>warningSecurityInformation</i>	Buffer containing security information about ETWS primary notification such as timestamp and digital signature

### 5.8.1.7.2 Member Function Documentation

**5.8.1.7.2.1** `GeographicalScope telux::tel::EtwsInfo::getGeographicalScope ( ) const`

Get the `geographicalScope` of cellbroadcast message.

#### Returns

[GeographicalScope](#).

**5.8.1.7.2.2** `int telux::tel::EtwsInfo::getMessageId ( ) const`

Get cellbroadcast message identifier. The message identifier identifies the type of the cell broadcast message defined in spec 3GPP TS 23.041 9.4.1.2.2

**Returns**

Message identifier.

**5.8.1.7.2.3 int telux::tel::EtwsInfo::getSerialNumber ( ) const**

Get the serial number of broadcast (geographical scope + message code + update number for GSM/UMTS).

**Returns**

int containing cellbroadcast serial number.

**5.8.1.7.2.4 std::string telux::tel::EtwsInfo::getLanguageCode ( ) const**

Get the ISO-639-1 language code for cell broadcast message, or empty string if unspecified. This is not applicable for ETWS primary notification.

**Returns**

Language code

**5.8.1.7.2.5 std::string telux::tel::EtwsInfo::getMessageBody ( ) const**

Get the body of cell broadcast message, or empty string if no body available. For ETWS primary notification based on message identifier pre canned message will be sent.

**Returns**

body or empty string

**5.8.1.7.2.6 MessagePriority telux::tel::EtwsInfo::getPriority ( ) const**

Get the priority for the cell broadcast message.

**Returns**

[MessagePriority](#).

**5.8.1.7.2.7 int telux::tel::EtwsInfo::getMessageCode ( ) const**

Get the cellbroadcast message code.

**Returns**

int containing cellbroadcast message code.

**5.8.1.7.2.8 int telux::tel::EtwsInfo::getUpdateNumber ( ) const**

Get the cellbroadcast message update number.

**Returns**

int containing cellbroadcast message's update number.

**5.8.1.7.2.9 EtwsWarningType telux::tel::EtwsInfo::getEtwsWarningType ( )**

Get ETWS warning type.

**Returns**

[EtwsWarningType](#).

**5.8.1.7.2.10 bool telux::tel::EtwsInfo::isEmergencyUserAlert ( )**

Returns the ETWS emergency user alert flag.

**Returns**

true to notify terminal to activate emergency user alert or false otherwise

**5.8.1.7.2.11 bool telux::tel::EtwsInfo::isPopupAlert ( )**

Returns the ETWS activate popup flag.

**Returns**

true to notify terminal to activate display popup or false otherwise

**5.8.1.7.2.12 bool telux::tel::EtwsInfo::isPrimary ( )**

Returns the ETWS format flag. This flag determine whether ETWS message is primary notification or not.

**Returns**

true if the message is primary message, otherwise secondary message

**5.8.1.7.2.13 std::vector<uint8\_t> telux::tel::EtwsInfo::getWarningSecurityInformation ( )**

Returns security information about ETWS primary notification such as timestamp and digital signature(applicable only for GSM).

**Returns**

byte buffer

### 5.8.1.8 class telux::tel::CmasInfo

Contains information elements for a GSM/UMTS/E-UTRAN/NG-RAN CMAS warning notification. Supported values for each element are defined in 3GPP TS 23.041.

#### Public member functions

- [CmasInfo](#) ([GeographicalScope](#) geographicalScope, int msgId, int serialNumber, std::string languageCode, std::string messageText, [MessagePriority](#) priority, [CmasMessageClass](#) messageClass, [CmasSeverity](#) severity, [CmasUrgency](#) urgency, [CmasCertainty](#) certainty, std::shared\_ptr<[WarningAreaInfo](#)> warningAreaInfo)
- [GeographicalScope](#) getGeographicalScope () const
- int getMessageId () const
- int getSerialNumber () const
- std::string getLanguageCode () const
- std::string getMessageBody () const
- [MessagePriority](#) getPriority () const
- int getMessageCode () const
- int getUpdateNumber () const
- [CmasMessageClass](#) getMessageClass ()
- [CmasSeverity](#) getSeverity ()
- [CmasUrgency](#) getUrgency ()
- [CmasCertainty](#) getCertainty ()
- std::shared\_ptr<[WarningAreaInfo](#)> getWarningAreaInfo ()

#### 5.8.1.8.1 Constructors and Destructors

**5.8.1.8.1.1** `telux::tel::CmasInfo::CmasInfo ( GeographicalScope geographicalScope, int msgId, int serialNumber, std::string languageCode, std::string messageText, MessagePriority priority, CmasMessageClass messageClass, CmasSeverity severity, CmasUrgency urgency, CmasCertainty certainty, std::shared_ptr<WarningAreaInfo> warningAreaInfo )`

[CmasInfo](#) constructor.

#### Parameters

in	<i>geographicalScope</i>	<a href="#">GeographicalScope</a>
in	<i>msgId</i>	Unique message identifier
in	<i>serialNumber</i>	Serial number for message
in	<i>languageCode</i>	ISO-639-1 language code for message
in	<i>messageText</i>	Message text
in	<i>priority</i>	<a href="#">MessagePriority</a>
in	<i>messageClass</i>	<a href="#">CmasMessageClass</a>

in	<i>severity</i>	<a href="#">CmasSeverity</a>
in	<i>urgency</i>	<a href="#">CmasUrgency</a>
in	<i>certainty</i>	<a href="#">CmasCertainty</a>

### 5.8.1.8.2 Member Function Documentation

#### 5.8.1.8.2.1 GeographicalScope telux::tel::CmasInfo::getGeographicalScope ( ) const

Get the geographicalScope of cellbroadcast message.

##### Returns

[GeographicalScope](#).

#### 5.8.1.8.2.2 int telux::tel::CmasInfo::getMessageId ( ) const

Get cellbroadcast message identifier. The message identifier identifies the type of the cell broadcast message defined in spec 3GPP TS 23.041 9.4.1.2.2

##### Returns

Message identifier.

#### 5.8.1.8.2.3 int telux::tel::CmasInfo::getSerialNumber ( ) const

Get the serial number of broadcast (geographical scope + message code + update number for GSM/UMTS).

##### Returns

int containing cellbroadcast serial number.

#### 5.8.1.8.2.4 std::string telux::tel::CmasInfo::getLanguageCode ( ) const

Get the ISO-639-1 language code for cell broadcast message, or empty string if unspecified. This is not applicable for ETWS primary notification.

##### Returns

Language code

**5.8.1.8.2.5 std::string telux::tel::CmasInfo::getMessageBody ( ) const**

Get the body of cell broadcast message, or empty string if no body available. For ETWS primary notification based on message identifier pre canned message will be sent.

**Returns**

body or empty string

**5.8.1.8.2.6 MessagePriority telux::tel::CmasInfo::getPriority ( ) const**

Get the priority for the cell broadcast message.

**Returns**

[MessagePriority](#).

**5.8.1.8.2.7 int telux::tel::CmasInfo::getMessageCode ( ) const**

Get the cellbroadcast message code.

**Returns**

int containing cellbroadcast message code.

**5.8.1.8.2.8 int telux::tel::CmasInfo::getUpdateNumber ( ) const**

Get the cellbroadcast message update number.

**Returns**

int containing cellbroadcast message's update number.

**5.8.1.8.2.9 CmasMessageClass telux::tel::CmasInfo::getMessageClass ( )**

Get CMAS message class.

**Returns**

[CmasMessageClass](#).

**5.8.1.8.2.10 CmasSeverity telux::tel::CmasInfo::getSeverity ( )**

Get CMAS message severity.

**Returns**

[CmasSeverity](#).

#### 5.8.1.8.2.11 CmasUrgency telux::tel::CmasInfo::getUrgency ( )

Get CMAS message urgency.

##### Returns

[CmasUrgency](#).

#### 5.8.1.8.2.12 CmasCertainty telux::tel::CmasInfo::getCertainty ( )

Get CMAS message certainty.

##### Returns

[CmasCertainty](#).

#### 5.8.1.8.2.13 std::shared\_ptr<WarningAreaInfo> telux::tel::CmasInfo::getWarningAreaInfo ( )

Returns warning area information for alert. This is applicable for LTE and NR5G

##### Returns

pointer to [WarningAreaInfo](#) or null if there is no warning area information available.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.8.1.9 class telux::tel::CellBroadcastMessage

Cell Broadcast message.

#### Public member functions

- [CellBroadcastMessage](#) (std::shared\_ptr< [EtwsInfo](#) > etwsInfo)
- [CellBroadcastMessage](#) (std::shared\_ptr< [CmasInfo](#) > cmasInfo)
- [MessageType](#) [getMessageType](#) () const
- std::shared\_ptr< [EtwsInfo](#) > [getEtwsInfo](#) () const
- std::shared\_ptr< [CmasInfo](#) > [getCmasInfo](#) () const

#### 5.8.1.9.1 Constructors and Destructors

##### 5.8.1.9.1.1 telux::tel::CellBroadcastMessage::CellBroadcastMessage ( std::shared\_ptr< [EtwsInfo](#) > [etwsInfo](#) )

[CellBroadcastMessage](#) constructor.

in	<i>etwsInfo</i>	<a href="#">EtwsInfo</a>
----	-----------------	--------------------------

#### 5.8.1.9.1.2 `telux::tel::CellBroadcastMessage::CellBroadcastMessage ( std::shared_ptr< CmasInfo > cmasInfo )`

[CellBroadcastMessage](#) constructor.

#### Parameters

in	<i>cmasInfo</i>	<a href="#">CmasInfo</a>
----	-----------------	--------------------------

### 5.8.1.9.2 Member Function Documentation

#### 5.8.1.9.2.1 `MessageType telux::tel::CellBroadcastMessage::getMessageType ( ) const`

Get the cellbroadcast message type.

#### Returns

[MessageType](#).

#### 5.8.1.9.2.2 `std::shared_ptr<EtwsInfo> telux::tel::CellBroadcastMessage::getEtwsInfo ( ) const`

Get ETWS warning notification containing information about the ETWS warning type, the emergency user alert flag and the popup flag. This method should be called only if message type returned by [getMessageType\(\)](#) API is [MessageType::ETWS](#)

#### Returns

pointer to [EtwsInfo](#) or null if this is not an ETWS warning notification

#### 5.8.1.9.2.3 `std::shared_ptr<CmasInfo> telux::tel::CellBroadcastMessage::getCmasInfo ( ) const`

Get CMAS warning notification containing information about the CMAS message class, severity, urgency and certainty. This method should be called only if message type returned by [getMessageType\(\)](#) API is [MessageType::CMAS](#)

#### Returns

pointer to [CmasInfo](#) or null if this is not a CMAS warning notification

### 5.8.1.10 `class telux::tel::ICellBroadcastManager`

`CellBroadcastManager` class is primary interface to configure and activate emergency broadcast messages and receive broadcast messages.

**Public member functions**

- virtual bool `isSubsystemReady ()=0`
- virtual `std::future< bool > onSubsystemReady ()=0`
- virtual SlotId `getSlotId ()=0`
- virtual `telux::common::Status updateMessageFilters (std::vector< CellBroadcastFilter > filters, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status requestMessageFilters (RequestFiltersResponseCallback callback)=0`
- virtual `telux::common::Status setActivationStatus (bool activate, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status requestActivationStatus (RequestActivationStatusResponseCallback callback)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< ICellBroadcastListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< ICellBroadcastListener > listener)=0`
- virtual `~ICellBroadcastManager ()`

**5.8.1.10.1 Constructors and Destructors**

**5.8.1.10.1.1** virtual `telux::tel::ICellBroadcastManager::~~ICellBroadcastManager ( ) [virtual]`

**5.8.1.10.2 Member Function Documentation**

**5.8.1.10.2.1** virtual bool `telux::tel::ICellBroadcastManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of network subsystem and returns the result.

**Returns**

True if network subsystem is ready for service otherwise false.

**5.8.1.10.2.2** virtual `std::future<bool> telux::tel::ICellBroadcastManager::onSubsystemReady ( ) [pure virtual]`

Wait for network subsystem to be ready.

**Returns**

A future that caller can wait on to be notified when network subsystem is ready.

**5.8.1.10.2.3 virtual SlotId telux::tel::ICellBroadcastManager::getSlotId ( ) [pure virtual]**

Get associated slot for this CellBroadcastManager.

**Returns**

SlotId

**5.8.1.10.2.4 virtual telux::common::Status telux::tel::ICellBroadcastManager::updateMessageFilters ( std::vector< CellBroadcastFilter > filters, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

Configures the broadcast messages to be received.

**Parameters**

in	<i>filters</i>	List of filtered broadcast message identifiers.
in	<i>callback</i>	Optional callback to get the response of set cell broadcast filters.

**Returns**

Status of updateMessageIdFilters i.e. success or suitable error code.

**5.8.1.10.2.5 virtual telux::common::Status telux::tel::ICellBroadcastManager::requestMessageFilters ( RequestFiltersResponseCallback callback ) [pure virtual]**

Retrieve configured message filters for which broadcast messages will be received.

**Parameters**

in	<i>callback</i>	Callback to get the response of get cell broadcast filters.
----	-----------------	---

**Returns**

Status of requestMessageIdFilters i.e. success or suitable error code.

**5.8.1.10.2.6 virtual telux::common::Status telux::tel::ICellBroadcastManager::setActivationStatus ( bool activate, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

Allows activation and deactivation of configured broadcast messages.

**Parameters**

in	<i>activate</i>	Activate/deactivate broadcast messages.
in	<i>callback</i>	Optional callback pointer to get the response.

**Returns**

Status of setActivationStatus i.e. success or suitable error code.

**5.8.1.10.2.7 virtual telux::common::Status telux::tel::ICellBroadcastManager::requestActivationStatus ( RequestActivationStatusResponseCallback *callback* ) [pure virtual]**

Get activation status for configured broadcast messages.

**Parameters**

<i>in</i>	<i>callback</i>	Callback pointer to get the response.
-----------	-----------------	---------------------------------------

**Returns**

Status of requestActivationStatus i.e. success or suitable error code.

**5.8.1.10.2.8 virtual telux::common::Status telux::tel::ICellBroadcastManager::registerListener ( std::weak\_ptr< ICellBroadcastListener > *listener* ) [pure virtual]**

Register a listener for cell broadcast messages.

**Parameters**

<i>in</i>	<i>listener</i>	Pointer to <a href="#">ICellBroadcastListener</a> object which receives broadcast message.
-----------	-----------------	--

**Returns**

Status of registerListener i.e. success or suitable error code.

**5.8.1.10.2.9 virtual telux::common::Status telux::tel::ICellBroadcastManager::deregisterListener ( std::weak\_ptr< ICellBroadcastListener > *listener* ) [pure virtual]**

De-register the listener.

**Parameters**

<i>in</i>	<i>listener</i>	Listener to be de-registered
-----------	-----------------	------------------------------

**Returns**

Status of deregisterListener i.e. success or suitable error code.

### 5.8.1.11 class telux::tel::ICellBroadcastListener

A listener class which monitors cell broadcast messages.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onIncomingMessage](#) (SlotId slotId, const std::shared\_ptr< [CellBroadcastMessage](#) > cbMessage)
- virtual void [onMessageFilterChange](#) (SlotId slotId, std::vector< [CellBroadcastFilter](#) > filters)
- virtual [~ICellBroadcastListener](#) ()

#### 5.8.1.11.1 Constructors and Destructors

5.8.1.11.1 virtual telux::tel::ICellBroadcastListener::~~ICellBroadcastListener ( ) [virtual]

#### 5.8.1.11.2 Member Function Documentation

5.8.1.11.2.1 virtual void telux::tel::ICellBroadcastListener::onIncomingMessage ( SlotId *slotId*, const std::shared\_ptr< [CellBroadcastMessage](#) > *cbMessage* ) [virtual]

This function is called when device receives an incoming cell broadcast message.

#### Parameters

in	<i>slotId</i>	- Slot Id on which broadcast message is received.
in	<i>cbMessage</i>	- Broadcast message with information related to ETWS/CMAS notification.

5.8.1.11.2.2 virtual void telux::tel::ICellBroadcastListener::onMessageFilterChange ( SlotId *slotId*, std::vector< [CellBroadcastFilter](#) > *filters* ) [virtual]

This function is called when there is change in broadcast configuration like updation of message filters by the client using [ICellBroadcastManager::updateMessageFilters](#).

#### Parameters

in	<i>slotId</i>	- Slot Id on which change in message filters is received.
in	<i>filters</i>	- Complete list of configured broadcast message filters.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.8.2 Enumeration Type Documentation

### 5.8.2.1 enum telux::tel::GeographicalScope [strong]

Defines geographical scope of cell broadcast.

#### Enumerator

**CELL\_WIDE\_IMMEDIATE** Cell wide geographical scope with immediate display  
**PLMN\_WIDE** PLMN wide geographical scope  
**LA\_WIDE**  
**CELL\_WIDE** Location / Service/ Tracking area wide geographical scope  
(GSM/UMTS/E-UTRAN/NG-RAN). Cell wide geographical scope

### 5.8.2.2 enum telux::tel::MessagePriority [strong]

Defines priority for cell broadcast message.

#### Enumerator

**UNKNOWN** Unknown message priority  
**NORMAL** Normal message priority  
**EMERGENCY** Emergency message priority

### 5.8.2.3 enum telux::tel::MessageType [strong]

Defines message type for cell broadcast message.

#### Enumerator

**UNKNOWN** Unknown message type  
**ETWS** Earthquake and Tsunami Warning System  
**CMAS** Commercial Mobile Alert System

### 5.8.2.4 enum telux::tel::EtwsWarningType [strong]

Defines warning type for ETWS cell broadcast message.

#### Enumerator

**UNKNOWN** Unknown ETWS warning type  
**EARTHQUAKE** ETWS warning type for earthquake  
**TSUNAMI** ETWS warning type for tsunami  
**EARTHQUAKE\_AND\_TSUNAMI** ETWS warning type for earthquake and tsunami  
**TEST\_MESSAGE** ETWS warning type for test messages  
**OTHER\_EMERGENCY** ETWS warning type for other emergency types

### 5.8.2.5 enum telux::tel::CmasMessageClass [strong]

Defines message class for CMAS cell broadcast message.

**Enumerator**

**UNKNOWN** CMAS category for warning types that are reserved for future extension  
**PRESIDENTIAL\_LEVEL\_ALERT** Presidential-level alert (Korean Public Alert System Class 0 message)  
**EXTREME\_THREAT** Extreme threat to life and property (Korean Public Alert System Class 1 message)  
**SEVERE\_THREAT** Severe threat to life and property (Korean Public Alert System Class 1 message).  
**CHILD\_ABDUCTION\_EMERGENCY** Child abduction emergency (AMBER Alert)  
**REQUIRED\_MONTHLY\_TEST** CMAS test message  
**CMAS\_EXERCISE** CMAS exercise  
**OPERATOR\_DEFINED\_USE** CMAS category for operator defined use

**5.8.2.6 enum telux::tel::CmasSeverity [strong]**

Defines severity type for CMAS cell broadcast message.

**Enumerator**

**UNKNOWN** CMAS alert severity is unknown. The severity is available for all GSM/UMTS alerts except for the Presidential-level alert class (Korean Public Alert System Class 0).  
**EXTREME** Extraordinary threat to life or property  
**SEVERE** Significant threat to life or property

**5.8.2.7 enum telux::tel::CmasUrgency [strong]**

Defines urgency type for CMAS cell broadcast message.

**Enumerator**

**UNKNOWN** CMAS alert urgency is unknown. The urgency is available for all GSM/UMTS alerts except for the Presidential-level alert class (Korean Public Alert System Class 0).  
**IMMEDIATE** Responsive action should be taken immediately  
**EXPECTED** Responsive action should be taken within the next hour

**5.8.2.8 enum telux::tel::CmasCertainty [strong]**

Defines certainty type for CMAS cell broadcast message.

**Enumerator**

**UNKNOWN** CMAS alert certainty is unknown. The certainty is available for all GSM/UMTS alerts except for the Presidential-level alert class (Korean Public Alert System Class 0).  
**OBSERVED** Determined to have occurred or to be ongoing.  
**LIKELY** Likely (probability > ~50%)

**5.8.2.9 enum telux::tel::GeometryType [strong]**

Defines geometry type specified in wireless emergency alert.

**Enumerator**

**UNKNOWN** Unknown geometry type

**POLYGON** Polygon geometry type

**CIRCLE** Circle geometry type

## 5.9 IMS Settings

This section contains APIs related to IMS Configuration.

### 5.9.1 Data Structure Documentation

#### 5.9.1.1 struct telux::tel::ImsServiceConfig

Defines the selected IMS service configuration parameters and their corresponding value

##### Data fields

Type	Field	Description
<a href="#">ImsService↔ ConfigValidity</a>	config↔ ValidityMask	Indicates the configurations type. Bit set to 1 denotes the config is valid.
bool	imsService↔ Enabled	Enable/Disable IMS service
bool	voImsEnabled	Enable/Disable VOIMS service

#### 5.9.1.2 class telux::tel::ImsSettingsManager

ImsSettingsManager allows IMS settings. For example enabling or disabling IMS service, VOIMS service.

##### Public member functions

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual [telux::common::Status](#) requestServiceConfig (SlotId slotId, [ImsServiceConfigCb](#) callback)=0
- virtual [telux::common::Status](#) setServiceConfig (SlotId slotId, [ImsServiceConfig](#) config, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [ImsSettingsListener](#) > listener)=0
- virtual [telux::common::Status](#) deregisterListener (std::weak\_ptr< [ImsSettingsListener](#) > listener)=0
- virtual [~ImsSettingsManager](#) ()

##### 5.9.1.2.1 Constructors and Destructors

5.9.1.2.1.1 virtual [telux::tel::ImsSettingsManager::~ImsSettingsManager](#) ( ) [[virtual](#)]

##### 5.9.1.2.2 Member Function Documentation

5.9.1.2.2.1 virtual [telux::common::ServiceStatus](#) [telux::tel::ImsSettingsManager::getServiceStatus](#) ( ) [[pure virtual](#)]

This status indicates whether the [ImsSettingsManager](#) object is in a usable state.

##### Returns

SERVICE\_AVAILABLE - If IMS settings manager is ready for service. SERVICE\_UNAVAILABLE

- If IMS settings manager is temporarily unavailable. SERVICE\_FAILED - If IMS settings manager encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.9.1.2.2.2 virtual telx::common::Status telx::tel::ImsSettingsManager::requestServiceConfig ( SlotId *slotId*, ImsServiceConfigCb *callback* ) [pure virtual]

Request the IMS service configurations

#### Parameters

in	<i>slotId</i>	Slot for which the IMS service configurations is requested.
in	<i>callback</i>	Callback function to get the response of request IMS service configurations.

#### Returns

Status of requestServiceConfig i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.9.1.2.2.3 virtual telx::common::Status telx::tel::ImsSettingsManager::setServiceConfig ( SlotId *slotId*, ImsServiceConfig *config*, common::ResponseCallback *callback* = nullptr ) [pure virtual]

To configure the IMS service configurations. Also specify whether configuration needs to be enabled or disabled.

#### Parameters

in	<i>slotId</i>	Slot for which the IMS service configuration is intended.
in	<i>config</i>	Indicates which configuration are configured currently and whether the config is enabled or disabled. <a href="#">ImsServiceConfig</a> .
in	<i>callback</i>	Callback function to get the response of set IMS service configuration request.

#### Returns

Status of setServiceConfig i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.9.1.2.2.4 virtual telux::common::Status telux::tel::IImSettingsManager::registerListener ( std::weak\_ptr< IImSettingsListener > *listener* ) [pure virtual]

Register a listener for specific events in the IMS settings subsystem.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">IImSettingsListener</a> object that processes the notification
----	-----------------	---

**Returns**

Status of registerListener i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.9.1.2.2.5 virtual telux::common::Status telux::tel::IImSettingsManager::deregisterListener ( std::weak\_ptr< IImSettingsListener > *listener* ) [pure virtual]

Deregister the previously added listener.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">IImSettingsListener</a> object that needs to be deregistered.
----	-----------------	--

**Returns**

Status of deregisterListener i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.9.1.3 class telux::tel::IImSettingsListener

Listener class for getting IMS service configuration change notifications. The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

## Public member functions

- virtual void [onImsServiceConfigsChange](#) (SlotId slotId, [ImsServiceConfig](#) config)
- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual [~ImsSettingsListener](#) ()

### 5.9.1.3.1 Constructors and Destructors

5.9.1.3.1.1 virtual [telux::tel::ImsSettingsListener::~~ImsSettingsListener](#) ( ) [virtual]

Destructor of [ImsSettingsListener](#)

### 5.9.1.3.2 Member Function Documentation

5.9.1.3.2.1 virtual void [telux::tel::ImsSettingsListener::onImsServiceConfigsChange](#) ( SlotId *slotId*, [ImsServiceConfig](#) *config* ) [virtual]

This function is called whenever any IMS service configuration is changed.

#### Parameters

in	<i>slotId</i>	SIM corresponding to slot identifier for which the IMS service configuration has changed.
in	<i>config</i>	Indicates which configuration is valid and whether the config is enabled or disabled. <a href="#">ImsServiceConfig</a> .

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

5.9.1.3.2.2 virtual void [telux::tel::ImsSettingsListener::onServiceStatusChange](#) ( [telux::common::ServiceStatus](#) *status* ) [virtual]

This function is called when [ImsSettingsManager](#) service status changes.

#### Parameters

in	<i>status</i>	- ServiceStatus
----	---------------	-----------------

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.9.2 Enumeration Type Documentation

### 5.9.2.1 enum telx::tel::ImsServiceConfigType

Defines the IMS service configuration parameters

#### Enumerator

***IMSSETTINGS\_VOIMS*** Voice calling support on LTE

***IMSSETTINGS\_IMS\_SERVICE*** IMS Normal Registration configuration

## 5.10 Multi SIM

This section contains APIs related to Multi SIM DSDA Configuration.

### 5.10.1 Data Structure Documentation

#### 5.10.1.1 struct telux::tel::SlotStatus

Represents status of a physical SIM slot

##### Data fields

Type	Field	Description
<a href="#">SlotState</a>	slotState	State of the physical SIM slot
<a href="#">CardState</a>	cardState	Status of the card in the physical slot
<a href="#">CardError</a>	cardError	Indicates the reason for the card error, and is valid only when the card state is CARDSTATE_ERROR.

#### 5.10.1.2 class telux::tel::IMultiSimManager

MultiSimManager allows to perform operation pertaining to devices which have more than one SIM/UICC card. Clients should check if the subsystem is ready before invoking any of the APIs as follows.

```
bool isReady = MultiSimManager->isSubsystemReady();
```

##### Public member functions

- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::Status](#) [getSlotCount](#) (int &count)=0
- virtual [telux::common::Status](#) [requestHighCapability](#) ([HighCapabilityCallback](#) callback)=0
- virtual [telux::common::Status](#) [setHighCapability](#) (int slotId, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) [switchActiveSlot](#) (SlotId slotId, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) [requestSlotStatus](#) ([SlotStatusCallback](#) callback)=0
- virtual [telux::common::Status](#) [registerListener](#) (std::weak\_ptr< [IMultiSimListener](#) > listener)=0
- virtual [telux::common::Status](#) [deregisterListener](#) (std::weak\_ptr< [IMultiSimListener](#) > listener)=0
- virtual [~IMultiSimManager](#) ()

#### 5.10.1.2.1 Constructors and Destructors

**5.10.1.2.1.1** `virtual telux::tel::IMultiSimManager::~IMultiSimManager ( ) [virtual]`

### 5.10.1.2.2 Member Function Documentation

**5.10.1.2.2.1** `virtual bool telux::tel::IMultiSimManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of Multi SIM subsystem and returns the result.

#### Returns

If true MultiSimManager is ready.

**5.10.1.2.2.2** `virtual std::future<bool> telux::tel::IMultiSimManager::onSubsystemReady ( ) [pure virtual]`

Wait for Multi SIM subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when Multi SIM subsystem is ready.

**5.10.1.2.2.3** `virtual telux::common::Status telux::tel::IMultiSimManager::getSlotCount ( int & count ) [pure virtual]`

Get SIM slot count. The count can be used to determine whether the device supports multi SIM.

#### Parameters

out	<i>count</i>	Slot count.
-----	--------------	-------------

#### Returns

Status of getSlotCount i.e. success or suitable error code.

**5.10.1.2.2.4** `virtual telux::common::Status telux::tel::IMultiSimManager::requestHighCapability ( HighCapabilityCallback callback ) [pure virtual]`

Request to find out which SIM/slot is allowed to use advance Radio Technology like 5G at a time. For example SIM/slot with high capability may allowed to use RAT capabilities like 5G/4G/3G/2G while the SIM/slot with low capability may be allowed to use RAT capabilities like 4G/2G.

#### Parameters

in	<i>callback</i>	Callback function to get the response of request high capability.
----	-----------------	---

#### Returns

Status of requestHighCapability i.e. success or suitable error code.

#### 5.10.1.2.2.5 **virtual telux::common::Status telux::tel::IMultiSimManager::setHighCapability ( int *slotId*, common::ResponseCallback *callback* = nullptr ) [pure virtual]**

Set SIM/slot with high capability asynchronously. On dual SIM devices, only one SIM may be allowed to use advanced Radio technology like 5G at a time. This API sets the SIM/slot that should be allowed the highest RAT capability. The other SIM/slot will be given lower RAT capabilities. For example, SIM in slot1 will be allowed 2G/3G/4G/5G and the SIM in slot2 will be allowed only 2G/4G.

##### Parameters

in	<i>slotId</i>	Slot set with high capability.
in	<i>callback</i>	Callback function to get the response of set high capability request.

##### Returns

Status of setHighCapability i.e. success or suitable error code.

#### 5.10.1.2.2.6 **virtual telux::common::Status telux::tel::IMultiSimManager::switchActiveSlot ( SlotId *slotId*, common::ResponseCallback *callback* = nullptr ) [pure virtual]**

Choose the physical SIM slot to be used by modem on Single-SIM TCU platforms. After switching the slot, only the SIM on chosen physical slot can be used for WWAN functionality.

##### Parameters

in	<i>slotId</i>	physical slot to be made active
in	<i>callback</i>	Callback function to get the response of slot switch request

##### Returns

Status of switchActiveSlot i.e. success or suitable error code.

#### 5.10.1.2.2.7 **virtual telux::common::Status telux::tel::IMultiSimManager::requestSlotStatus ( SlotStatusCallback *callback* ) [pure virtual]**

Request the status of physical slots.

##### Parameters

in	<i>callback</i>	Callback function to get the response of slot status request
----	-----------------	--

##### Returns

Status of requestSlotStatus i.e. success or suitable error code.

**5.10.1.2.2.8** `virtual telux::common::Status telux::tel::IMultiSimManager::registerListener ( std::weak_ptr< IMultiSimListener > listener ) [pure virtual]`

Register a listener for specific events in the Multi SIM subsystem.

#### Parameters

in	<i>listener</i>	Pointer to <a href="#">IMultiSimListener</a> object that processes the notification
----	-----------------	---

#### Returns

Status of registerListener i.e. success or suitable error code.

**5.10.1.2.2.9** `virtual telux::common::Status telux::tel::IMultiSimManager::deregisterListener ( std::weak_ptr< IMultiSimListener > listener ) [pure virtual]`

Deregister the previously added listener.

#### Parameters

in	<i>listener</i>	Pointer to <a href="#">IMultiSimListener</a> object that needs to be deregistered.
----	-----------------	--

#### Returns

Status of deregisterListener i.e. success or suitable error code.

### 5.10.1.3 class telux::tel::IMultiSimListener

Listener class for getting high capability change notification. The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

#### Public member functions

- virtual void [onHighCapabilityChanged](#) (int slotId)
- virtual void [onSlotStatusChanged](#) (std::map< SlotId, [SlotStatus](#) > slotStatus)
- virtual [~IMultiSimListener](#) ()

#### 5.10.1.3.1 Constructors and Destructors

**5.10.1.3.1.1** `virtual telux::tel::IMultiSimListener::~IMultiSimListener ( ) [virtual]`

Destructor of [IMultiSimListener](#)

### 5.10.1.3.2 Member Function Documentation

#### 5.10.1.3.2.1 virtual void telux::tel::IMultiSimListener::onHighCapabilityChanged ( int *slotId* ) [virtual]

This function is called whenever there is change in high capability for SIM/slot.

##### Parameters

in	<i>slotId</i>	SIM corresponding to slot identifier has high capability now.
----	---------------	---

#### 5.10.1.3.2.2 virtual void telux::tel::IMultiSimListener::onSlotStatusChanged ( std::map< SlotId, SlotStatus > *slotStatus* ) [virtual]

This function is called whenever there is change in physical SIM slots status.

##### Parameters

in	<i>slotStatus</i>	list of slots status <a href="#">SlotStatus</a>
----	-------------------	---

## 5.10.2 Enumeration Type Documentation

### 5.10.2.1 enum telux::tel::SlotState [strong]

Represents state of the physical SIM slot

##### Enumerator

**UNKNOWN**

**INACTIVE** Slot is inactive

**ACTIVE** Slot is active

## 5.11 Subscription Management

This section contains APIs related to Subscription Management.

### 5.11.1 Data Structure Documentation

#### 5.11.1.1 class telux::tel::ISubscription

Subscription returns information about network operator subscription details pertaining to a SIM card.

##### Public member functions

- virtual std::string [getCarrierName](#) ()=0
- virtual std::string [getIccId](#) ()=0
- virtual int [getMcc](#) ()=0
- virtual int [getMnc](#) ()=0
- virtual std::string [getMobileCountryCode](#) ()=0
- virtual std::string [getMobileNetworkCode](#) ()=0
- virtual std::string [getPhoneNumber](#) ()=0
- virtual int [getSlotId](#) ()=0
- virtual std::string [getImsi](#) ()=0
- virtual std::string [getGID1](#) ()=0
- virtual std::string [getGID2](#) ()=0
- virtual [~ISubscription](#) ()

##### 5.11.1.1.1 Constructors and Destructors

5.11.1.1.1 virtual telux::tel::ISubscription::~~ISubscription ( ) [virtual]

##### 5.11.1.1.2 Member Function Documentation

5.11.1.1.2.1 virtual std::string telux::tel::ISubscription::getCarrierName ( ) [pure virtual]

Retrieves the name of the carrier on which this subscription is made.

##### Returns

Name of the carrier.

**5.11.1.1.2.2 virtual std::string telux::tel::ISubscription::getIccId ( ) [pure virtual]**

Retrieves the SIM's ICCID (Integrated Chip ID) - i.e SIM Serial Number.

**Returns**

Integrated Chip Id.

**5.11.1.1.2.3 virtual int telux::tel::ISubscription::getMcc ( ) [pure virtual]**

Retrieves the mobile country code of the carrier to which the phone is connected.

**Returns**

Mobile Country Code.

**Deprecated** Use [telux::tel::ISubscription::getMobileCountryCode\(\)](#) API instead

**5.11.1.1.2.4 virtual int telux::tel::ISubscription::getMnc ( ) [pure virtual]**

Retrieves the mobile network code of the carrier to which phone is connected.

**Returns**

Mobile Network Code.

**Deprecated** Use [telux::tel::ISubscription::getMobileNetworkCode\(\)](#) API instead

**5.11.1.1.2.5 virtual std::string telux::tel::ISubscription::getMobileCountryCode ( ) [pure virtual]**

Retrieves the mobile country code(MCC) of the carrier to which the phone is connected.

**Returns**

mcc.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.11.1.1.2.6 virtual std::string telux::tel::ISubscription::getMobileNetworkCode ( ) [pure virtual]**

Retrieves the mobile network code(MNC) of the carrier to which the phone is connected.

**Returns**

mnc.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.11.1.1.2.7 virtual std::string telux::tel::ISubscription::getPhoneNumber ( ) [pure virtual]**

Retrieves the phone number for the SIM subscription.

**Returns**

PhoneNumber.

**5.11.1.1.2.8 virtual int telux::tel::ISubscription::getSlotId ( ) [pure virtual]**

Retrieves SIM Slot index for the SIM pertaining to this subscription object.

**Returns**

SIM slotId.

**5.11.1.1.2.9 virtual std::string telux::tel::ISubscription::getImsi ( ) [pure virtual]**

Retrieves IMSI (International Mobile Subscriber Identity) for the SIM. This will have home network MCC and MNC values.

**Returns**

imsi.

**5.11.1.1.2.10 virtual std::string telux::tel::ISubscription::getGID1 ( ) [pure virtual]**

Retrieves the GID1(group identifier level1) on the SIM. It represents identifier for particular SIM and ME associations. It can be used to identify a group of SIMs for a particular application. Defined in 3GPP Spec 131.102 section 4.2.10

**Returns**

GID1 content in hex format.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.11.1.1.2.11 virtual std::string telux::tel::ISubscription::getGID2 ( ) [pure virtual]

Retrieves the GID2(group identifier level2) content on the SIM. It represents identifier for particular SIM and ME associations. It can be used to identify a group of SIMs for a particular application. Defined in 3GPP Spec 131.102 section 4.2.11

#### Returns

GID2 content in hex format.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.11.1.2 class telux::tel::ISubscriptionListener

A listener class for receiving device subscription information. The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onSubscriptionInfoChanged](#) (std::shared\_ptr< [ISubscription](#) > subscription)
- virtual void [onNumberOfSubscriptionsChanged](#) (int count)
- virtual [~ISubscriptionListener](#) ()

#### 5.11.1.2.1 Constructors and Destructors

5.11.1.2.1.1 virtual telux::tel::ISubscriptionListener::~~ISubscriptionListener ( ) [virtual]

#### 5.11.1.2.2 Member Function Documentation

5.11.1.2.2.1 virtual void telux::tel::ISubscriptionListener::onSubscriptionInfoChanged ( std::shared\_ptr< [ISubscription](#) > *subscription* ) [virtual]

This function is called whenever there is a change in Subscription details.

#### Parameters

in	<i>subscription</i>	Pointer to <a href="#">ISubscription</a> Object.
----	---------------------	--

5.11.1.2.2.2 virtual void telux::tel::ISubscriptionListener::onNumberOfSubscriptionsChanged ( int *count* ) [virtual]

This function called whenever there is a change in the subscription count. for example when a new subscription is discovered or an existing subscription goes away when SIM is inserted or removed respectively.

in	count	count of subscription
----	-------	-----------------------

### 5.11.1.3 class telux::tel::ISubscriptionManager

#### Public member functions

- virtual bool `isSubsystemReady ()=0`
- virtual `std::future< bool > onSubsystemReady ()=0`
- virtual `std::shared_ptr< ISubscription > getSubscription (int slotId=DEFAULT_SLOT_ID, telux::common::Status *status=nullptr)=0`
- virtual `std::vector< std::shared_ptr< ISubscription > > getAllSubscriptions (telux::common::Status *status=nullptr)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< ISubscriptionListener > listener)=0`
- virtual `telux::common::Status removeListener (std::weak_ptr< ISubscriptionListener > listener)=0`
- virtual `~ISubscriptionManager ()`

#### 5.11.1.3.1 Constructors and Destructors

5.11.1.3.1.1 virtual `telux::tel::ISubscriptionManager::~~ISubscriptionManager ( ) [virtual]`

#### 5.11.1.3.2 Member Function Documentation

5.11.1.3.2.1 virtual bool `telux::tel::ISubscriptionManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of SubscriptionManager and returns the result.

#### Returns

If true then SubscriptionManager is ready for service.

5.11.1.3.2.2 virtual `std::future<bool> telux::tel::ISubscriptionManager::onSubsystemReady ( ) [pure virtual]`

Wait for Subscription subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when SubscriptionManager is ready.

5.11.1.3.2.3 virtual `std::shared_ptr<ISubscription> telux::tel::ISubscriptionManager::getSubscription ( int slotId = DEFAULT_SLOT_ID, telux::common::Status * status = nullptr ) [pure virtual]`

Get Subscription details of the SIM in the given SIM slot.

in	<i>slotId</i>	Slot id corresponding to the subscription.
out	<i>status</i>	Status of getSubscription i.e. success or suitable status code.

**Returns**

Pointer to [ISubscription](#) object.

**5.11.1.3.2.4** `virtual std::vector<std::shared_ptr<ISubscription> > telux::tel::ISubscriptionManager::getAllSubscriptions ( telux::common::Status * status = nullptr ) [pure virtual]`

Get all the subscription details of the device.

**Parameters**

out	<i>status</i>	Status of getAllSubscriptions i.e. success or suitable status code.
-----	---------------	---

**Returns**

list of [ISubscription](#) objects.

**5.11.1.3.2.5** `virtual telux::common::Status telux::tel::ISubscriptionManager::registerListener ( std::weak_ptr< ISubscriptionListener > listener ) [pure virtual]`

Register a listener for Subscription events.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ISubscriptionListener</a> object that processes the notification.
----	-----------------	--

**Returns**

Status of registerListener i.e. success or suitable status code.

**5.11.1.3.2.6** `virtual telux::common::Status telux::tel::ISubscriptionManager::removeListener ( std::weak_ptr< ISubscriptionListener > listener ) [pure virtual]`

Remove a previously added listener.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ISubscriptionListener</a> object that needs to be removed.
----	-----------------	---

**Returns**

Status of removeListener i.e. success or suitable status code.

## 5.12 Network Selection

Network Selection Manager provides the interface to get and set network selection mode (Manual or Automatic), scan available networks and set and get preferred networks list.

### 5.12.1 Data Structure Documentation

#### 5.12.1.1 struct telux::tel::PreferredNetworkInfo

Defines the preferred network information

##### Data fields

Type	Field	Description
uint16_t	mcc	mobile country code
uint16_t	mnc	mobile network code
<a href="#">RatMask</a>	ratMask	bit mask denotes which of the radio access technologies are set

#### 5.12.1.2 struct telux::tel::OperatorStatus

Defines status of network operator

##### Data fields

Type	Field	Description
<a href="#">InUseStatus</a>	inUse	In-use status of network operator
<a href="#">RoamingStatus</a>	roaming	Roaming status of network operator
<a href="#">Forbidden↔ Status</a>	forbidden	Forbidden status of network operator
<a href="#">PreferredStatus</a>	preferred	Preferred status of network operator

#### 5.12.1.3 struct telux::tel::NetworkScanInfo

Defines Network scan information

##### Data fields

Type	Field	Description
<a href="#">NetworkScan↔ Type</a>	scanType	Network scan type
<a href="#">RatMask</a>	ratMask	Bit mask denotes which of the radio access technologies are set. ratMask is valid/set only when scanType is provided as <a href="#">NetworkScanType::USER_SPECIFIED_RAT</a>

#### 5.12.1.4 class telux::tel::INetworkSelectionManager

Network Selection Manager class provides the interface to get and set network selection mode, preferred network list and scan available networks.

**Public member functions**

- virtual bool `isSubsystemReady ()=0`
- virtual `std::future< bool > onSubsystemReady ()=0`
- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `telux::common::Status requestNetworkSelectionMode (SelectionModeResponseCallback callback)=0`
- virtual `telux::common::Status setNetworkSelectionMode (NetworkSelectionMode selectMode, std::string mcc, std::string mnc, common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status requestPreferredNetworks (PreferredNetworksCallback callback)=0`
- virtual `telux::common::Status setPreferredNetworks (std::vector< PreferredNetworkInfo > preferredNetworksInfo, bool clearPrevious, common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status performNetworkScan (NetworkScanCallback callback)=0`
- virtual `telux::common::Status performNetworkScan (NetworkScanInfo info, common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< INetworkSelectionListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< INetworkSelectionListener > listener)=0`
- virtual `~INetworkSelectionManager ()`

**5.12.1.4.1 Constructors and Destructors**

**5.12.1.4.1.1** virtual `telux::tel::INetworkSelectionManager::~~INetworkSelectionManager ( )` [virtual]

**5.12.1.4.2 Member Function Documentation**

**5.12.1.4.2.1** virtual bool `telux::tel::INetworkSelectionManager::isSubsystemReady ( )` [pure virtual]

Checks the status of network subsystem and returns the result.

**Returns**

True if network subsystem is ready for service otherwise false.

**Deprecated** Use `INetworkSelectionManager::getServiceStatus()` API.

**5.12.1.4.2.2** virtual `std::future<bool> telux::tel::INetworkSelectionManager::onSubsystemReady ( )` [pure virtual]

Wait for network subsystem to be ready.

**Returns**

A future that caller can wait on to be notified when network subsystem is ready.

**Deprecated** Use `InitResponseCb` in `PhoneFactory::getNetworkSelectionManager` instead, to get notified about subsystem readiness.

**5.12.1.4.2.3** `virtual telux::common::ServiceStatus telux::tel::INetworkSelectionManager::getService↔  
Status ( ) [pure virtual]`

This status indicates whether the `INetworkSelectionManager` object is in a usable state.

**Returns**

`SERVICE_AVAILABLE` - If Serving System manager is ready for service.

`SERVICE_UNAVAILABLE` - If Serving System manager is temporarily unavailable.

`SERVICE_FAILED` - If Serving System manager encountered an irrecoverable failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.12.1.4.2.4** `virtual telux::common::Status telux::tel::INetworkSelectionManager::request↔  
NetworkSelectionMode ( SelectionModeResponseCallback callback ) [pure  
virtual]`

Get current network selection mode (i.e Manual or Automatic) asynchronously.

**Parameters**

in	<i>callback</i>	Callback function to get the response of get network selection mode request.
----	-----------------	--

**Returns**

Status of `requestNetworkSelectionMode` i.e. success or suitable error code.

**5.12.1.4.2.5** `virtual telux::common::Status telux::tel::INetworkSelectionManager::setNetwork↔  
SelectionMode ( NetworkSelectionMode selectMode, std::string mcc, std::string mnc,  
common::ResponseCallback callback = nullptr ) [pure virtual]`

Set current network selection mode and receive the response asynchronously.

**Parameters**

in	<i>selectMode</i>	Selection mode for a network i.e. automatic or manual. If selection mode is automatic then MCC and MNC are ignored. If it is manual, client has to explicitly pass MCC and MNC as arguments.
in	<i>callback</i>	Optional callback function to get the response of set network selection mode request.
in	<i>mcc</i>	Mobile Country Code (Applicable only for MANUAL selection mode).
in	<i>mnc</i>	Mobile Network Code (Applicable only for MANUAL selection mode).

**Returns**

Status of setNetworkSelectionMode i.e. success or suitable error code.

#### 5.12.1.4.2.6 **virtual telux::common::Status telux::tel::INetworkSelectionManager::requestPreferredNetworks ( PreferredNetworksCallback *callback* ) [pure virtual]**

Get 3GPP preferred network list and static 3GPP preferred network list asynchronously. Higher priority networks appear first in the list. The networks that appear in the 3GPP Preferred Networks list get higher priority than the networks in the static 3GPP preferred networks list.

**Parameters**

in	<i>callback</i>	Callback function to get the response of get preferred networks request.
----	-----------------	--

**Returns**

Status of requestPreferredNetworks i.e. success or suitable error code.

#### 5.12.1.4.2.7 **virtual telux::common::Status telux::tel::INetworkSelectionManager::setPreferredNetworks ( std::vector< PreferredNetworkInfo > *preferredNetworksInfo*, bool *clearPrevious*, common::ResponseCallback *callback* = nullptr ) [pure virtual]**

Set 3GPP preferred network list and receive the response asynchronously. It overrides the existing preferred network list. The preferred network list affects network selection selection when automatic registration is performed by the device. Higher priority networks should appear first in the list.

**Parameters**

in	<i>preferredNetworksInfo</i>	List of 3GPP preferred networks.
in	<i>clearPrevious</i>	If flag is false then new 3GPP preferred network list is appended to existing preferred network list. If flag is true then old list is flushed and new 3GPP preferred network list is added.

in	<i>callback</i>	Callback function to get the response of set preferred network list request.
----	-----------------	--

**Returns**

Status of setPreferredNetworks i.e. success or suitable error code.

#### 5.12.1.4.2.8 virtual telux::common::Status telux::tel::INetworkSelectionManager::performNetworkScan ( NetworkScanCallback *callback* ) [pure virtual]

Perform the network scan and returns a list of available networks.

**Parameters**

in	<i>callback</i>	Callback function to get the response of perform network scan request
----	-----------------	---

**Returns**

Status of performNetworkScan i.e. success or suitable error code.

**Deprecated** Use [INetworkSelectionManager::performNetworkScan\( common::ResponseCallback callback\)](#) API instead

#### 5.12.1.4.2.9 virtual telux::common::Status telux::tel::INetworkSelectionManager::performNetworkScan ( NetworkScanInfo *info*, common::ResponseCallback *callback* = nullptr ) [pure virtual]

Perform the network scan. The available networks list is returned incrementally as they become available, without waiting for the entire scan to complete through the indication API ([INetworkSelectionListener::onNetworkScanResults](#)). The scan status in indication will indicate if its a partial result or complete result.

**Parameters**

in	<i>info</i>	Provides network scan type and if the network scan type is user preferred RAT, includes RAT(s) information. <a href="#">NetworkScanInfo</a>
in	<i>callback</i>	Callback function to get the response of network scan request

**Returns**

Status of performNetworkScan i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.12.1.4.2.10** `virtual telux::common::Status telux::tel::INetworkSelectionManager::registerListener ( std::weak_ptr< INetworkSelectionListener > listener ) [pure virtual]`

Register a listener for specific updates from network access service.

#### Parameters

in	<i>listener</i>	Pointer of <a href="#">INetworkSelectionListener</a> object that processes the notification
----	-----------------	---

#### Returns

Status of registerListener i.e success or suitable status code.

**5.12.1.4.2.11** `virtual telux::common::Status telux::tel::INetworkSelectionManager::deregisterListener ( std::weak_ptr< INetworkSelectionListener > listener ) [pure virtual]`

Deregister the previously added listener.

#### Parameters

in	<i>listener</i>	Previously registered <a href="#">INetworkSelectionListener</a> that needs to be removed
----	-----------------	--

#### Returns

Status of removeListener success or suitable status code

### 5.12.1.5 class telux::tel::OperatorInfo

Operator Info class provides operator name, MCC, MNC and network status.

#### Public member functions

- [OperatorInfo](#) (std::string networkName, std::string mcc, std::string mnc, [OperatorStatus](#) operatorStatus)
- [OperatorInfo](#) (std::string networkName, std::string mcc, std::string mnc, [RadioTechnology](#) rat, [OperatorStatus](#) operatorStatus)
- std::string [getName](#) ()
- std::string [getMcc](#) ()
- std::string [getMnc](#) ()
- [RadioTechnology](#) [getRat](#) ()
- [OperatorStatus](#) [getStatus](#) ()

### 5.12.1.5.1 Constructors and Destructors

5.12.1.5.1.1 `telux::tel::OperatorInfo::OperatorInfo ( std::string networkName, std::string mcc, std::string mnc, OperatorStatus operatorStatus )`

5.12.1.5.1.2 `telux::tel::OperatorInfo::OperatorInfo ( std::string networkName, std::string mcc, std::string mnc, RadioTechnology rat, OperatorStatus operatorStatus )`

### 5.12.1.5.2 Member Function Documentation

5.12.1.5.2.1 `std::string telux::tel::OperatorInfo::getName ( )`

Get Operator name or description

#### Returns

Operator name.

5.12.1.5.2.2 `std::string telux::tel::OperatorInfo::getMcc ( )`

Get mcc from the operator numeric.

#### Returns

MCC.

5.12.1.5.2.3 `std::string telux::tel::OperatorInfo::getMnc ( )`

Get mnc from operator numeric.

#### Returns

MNC.

5.12.1.5.2.4 `RadioTechnology telux::tel::OperatorInfo::getRat ( )`

Get radio access technology.

#### Returns

Radio access technology(RAT) [RadioTechnology](#).

5.12.1.5.2.5 `OperatorStatus telux::tel::OperatorInfo::getStatus ( )`

Get status of operator.

#### Returns

status of the operator [OperatorStatus](#).

### 5.12.1.6 class telux::tel::INetworkSelectionListener

Listener class for getting network selection mode change notification.

The methods in listener can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

#### Public member functions

- virtual void [onSelectionModeChanged](#) ([NetworkSelectionMode](#) mode)
- virtual void [onNetworkScanResults](#) ([NetworkScanStatus](#) scanStatus, std::vector<[telux::tel::OperatorInfo](#) > operatorInfos)
- virtual [~INetworkSelectionListener](#) ()

#### 5.12.1.6.1 Constructors and Destructors

5.12.1.6.1.1 virtual [telux::tel::INetworkSelectionListener::~~INetworkSelectionListener](#) ( ) [[virtual](#)]

Destructor of [INetworkSelectionListener](#)

#### 5.12.1.6.2 Member Function Documentation

5.12.1.6.2.1 virtual void [telux::tel::INetworkSelectionListener::onSelectionModeChanged](#) ( [NetworkSelectionMode](#) *mode* ) [[virtual](#)]

This function is called whenever network selection mode is changed.

#### Parameters

in	<i>mode</i>	Network selection mode <a href="#">NetworkSelectionMode</a>
----	-------------	---

5.12.1.6.2.2 virtual void [telux::tel::INetworkSelectionListener::onNetworkScanResults](#) ( [NetworkScanStatus](#) *scanStatus*, std::vector< [telux::tel::OperatorInfo](#) > *operatorInfos* ) [[virtual](#)]

This function is called in response to performNetworkScan API. This API will be invoked multiple times in case of partial network scan results. In case of network scan failure and network scan completed this API will not be invoked further.

#### Parameters

in	<i>scanStatus</i>	Status of the network scan results <a href="#">NetworkScanStatus</a>
in	<i>operatorInfos</i>	Operators info with details of network operator name, MCC, MNC, etc. In case of partial network scan results, the operator info will have the information of the new set of operator info along with previous partial network scan results.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.12.2 Enumeration Type Documentation****5.12.2.1 enum telux::tel::RatType**

Defines network RAT type for preferred networks. Each value represents corresponding bit for RatMask bitset.

**Enumerator**

**UMTS** UMTS

**LTE** LTE

**LTE**

**GSM** GSM

**GSM**

**NR5G** NR5G

**NR5G**

**5.12.2.2 enum telux::tel::NetworkScanStatus [strong]**

Defines the status of the network scan results

**Enumerator**

**COMPLETE** Network scan is successful and completed. No more indications are expected for the scan request

**PARTIAL** Network scan results are partial, further results are expected in subsequent indication

**FAILED** Network scan failed either due to radio link failure or it is aborted or due to problem in performing incremental search.

**5.12.2.3 enum telux::tel::NetworkSelectionMode [strong]**

Defines network selection mode

**Enumerator**

**UNKNOWN** Unknown

**AUTOMATIC** Device registers according to provisioned mcc and mnc

**MANUAL** Device registers to specified network as per provided mcc and mnc

**5.12.2.4 enum telux::tel::InUseStatus [strong]**

Defines in-use status of network operator

**Enumerator**

**UNKNOWN** Unknown

**CURRENT\_SERVING** Current serving

**AVAILABLE** Available

### 5.12.2.5 enum telux::tel::RoamingStatus [strong]

Defines roaming status of network operator

#### Enumerator

**UNKNOWN** Unknown

**HOME** Home

**ROAM** Roaming

### 5.12.2.6 enum telux::tel::ForbiddenStatus [strong]

Defines forbidden status of network operator

#### Enumerator

**UNKNOWN** Unknown

**FORBIDDEN** Forbidden

**NOT\_FORBIDDEN** Not forbidden

### 5.12.2.7 enum telux::tel::PreferredStatus [strong]

Defines preferred status of network operator

#### Enumerator

**UNKNOWN** Unknown

**PREFERRED** Preferred

**NOT\_PREFERRED** Not preferred

### 5.12.2.8 enum telux::tel::NetworkScanType [strong]

Defines Network scan type

#### Enumerator

**CURRENT\_RAT\_PREFERENCE** Network scan based on current RAT preference

**USER\_SPECIFIED\_RAT** Network scan based on user specified RAT(s)

**ALL\_RATS** Network scan on GSM/WCDMA/LTE/NR5G

## 5.13 Serving System

Serving System Manager class provides the interface to request and set service domain preference and radio access technology mode preference for searching and registering (CS/PS domain, RAT and operation mode)

### 5.13.1 Data Structure Documentation

#### 5.13.1.1 struct telux::tel::ServingSystemInfo

Defines current serving system information

##### Data fields

Type	Field	Description
<a href="#">Radio↔ Technology</a>	rat	Current serving RAT
<a href="#">ServiceDomain</a>	domain	Current service domain registered on system for the serving RAT

#### 5.13.1.2 struct telux::tel::DcStatus

Defines Dual Connectivity status

##### Data fields

Type	Field	Description
<a href="#">Endc↔ Availability</a>	endc↔ Availability	ENDC availability
<a href="#">DcnrRestriction</a>	dcnrRestriction	DCNR restriction

#### 5.13.1.3 class telux::tel::IServingSystemManager

Serving System Manager class provides the API to request and set service domain preference and RAT preference.

##### Public member functions

- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual [telux::common::Status](#) [setRatPreference](#) ([RatPreference](#) ratPref, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) [requestRatPreference](#) ([RatPreferenceCallback](#) callback)=0
- virtual [telux::common::Status](#) [setServiceDomainPreference](#) ([ServiceDomainPreference](#) serviceDomain, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) [requestServiceDomainPreference](#) ([ServiceDomainPreferenceCallback](#) callback)=0

- virtual `telux::common::Status getSystemInfo (ServingSystemInfo &sysInfo)=0`
- virtual `telux::tel::DcStatus getDcStatus ()=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< IServingSystemListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< IServingSystemListener > listener)=0`
- virtual `~IServingSystemManager ()`

### 5.13.1.3.1 Constructors and Destructors

#### 5.13.1.3.1.1 virtual `telux::tel::IServingSystemManager::~~IServingSystemManager ( ) [virtual]`

Destructor of `IServingSystemManager`

### 5.13.1.3.2 Member Function Documentation

#### 5.13.1.3.2.1 virtual `bool telux::tel::IServingSystemManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of serving subsystem and returns the result.

#### Returns

True if serving subsystem is ready for service otherwise false.

**Deprecated** Use `IServingSystemManager::getServiceStatus()` API.

#### 5.13.1.3.2.2 virtual `std::future<bool> telux::tel::IServingSystemManager::onSubsystemReady ( ) [pure virtual]`

Wait for serving subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when serving subsystem is ready.

**Deprecated** Use `InitResponseCb` in `PhoneFactory::getServingSystemManager` instead, to get notified about subsystem readiness.

### 5.13.1.3.2.3 virtual telux::common::ServiceStatus telux::tel::IServingSystemManager::getServiceStatus ( ) [pure virtual]

This status indicates whether the [IServingSystemManager](#) object is in a usable state.

#### Returns

SERVICE\_AVAILABLE - If Serving System manager is ready for service.

SERVICE\_UNAVAILABLE - If Serving System manager is temporarily unavailable.

SERVICE\_FAILED - If Serving System manager encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.13.1.3.2.4 virtual telux::common::Status telux::tel::IServingSystemManager::setRatPreference ( RatPreference *ratPref*, common::ResponseCallback *callback* = nullptr ) [pure virtual]

Set the preferred radio access technology mode that the device should use to acquire service.

#### Parameters

in	<i>ratPref</i>	Radio access technology mode preference.
in	<i>callback</i>	Callback function to get the response of set RAT mode preference.

#### Returns

Status of setRatPreference i.e. success or suitable error code.

### 5.13.1.3.2.5 virtual telux::common::Status telux::tel::IServingSystemManager::requestRatPreference ( RatPreferenceCallback *callback* ) [pure virtual]

Request for preferred radio access technology mode.

#### Parameters

in	<i>callback</i>	Callback function to get the response of request preferred RAT mode.
----	-----------------	--

#### Returns

Status of requestRatPreference i.e. success or suitable error code.

**5.13.1.3.2.6** `virtual telux::common::Status telux::tel::IServingSystemManager::setServiceDomainPreference ( ServiceDomainPreference serviceDomain, common::ResponseCallback callback = nullptr ) [pure virtual]`

Initiate service domain preference like CS, PS or CS\_PS and receive the response asynchronously.

#### Parameters

in	<i>serviceDomain</i>	<a href="#">ServiceDomainPreference</a> .
in	<i>callback</i>	Callback function to get the response of set service domain preference request.

#### Returns

Status of setServiceDomainPreference i.e. success or suitable error code.

**5.13.1.3.2.7** `virtual telux::common::Status telux::tel::IServingSystemManager::requestServiceDomainPreference ( ServiceDomainPreferenceCallback callback ) [pure virtual]`

Request for Service Domain Preference asynchronously.

#### Parameters

in	<i>callback</i>	Callback function to get the response of request service domain preference.
----	-----------------	---

#### Returns

Status of requestServiceDomainPreference i.e. success or suitable error code.

**5.13.1.3.2.8** `virtual telux::common::Status telux::tel::IServingSystemManager::getSystemInfo ( ServingSystemInfo & sysInfo ) [pure virtual]`

Get the Serving system information. Supports only 3GPP RATs.

#### Parameters

out	<i>sysInfo</i>	Serving system information <a href="#">ServingSystemInfo</a>
-----	----------------	--

#### Returns

Status of getServingSystemInfo i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.13.1.3.2.9 virtual telx::tel::DcStatus telx::tel::IServingSystemManager::getDcStatus ( ) [pure virtual]**

Request for Dual Connectivity status on 5G NR.

#### Returns

[DcStatus](#)

**5.13.1.3.2.10 virtual telx::common::Status telx::tel::IServingSystemManager::registerListener ( std::weak\_ptr< IServingSystemListener > *listener* ) [pure virtual]**

Register a listener for specific updates from serving system.

#### Parameters

in	<i>listener</i>	Pointer of <a href="#">IServingSystemListener</a> object that processes the notification
----	-----------------	--

#### Returns

Status of registerListener i.e success or suitable status code.

**5.13.1.3.2.11 virtual telx::common::Status telx::tel::IServingSystemManager::deregisterListener ( std::weak\_ptr< IServingSystemListener > *listener* ) [pure virtual]**

Deregister the previously added listener.

#### Parameters

in	<i>listener</i>	Previously registered <a href="#">IServingSystemListener</a> that needs to be removed
----	-----------------	---

#### Returns

Status of removeListener i.e. success or suitable status code

### 5.13.1.4 class telx::tel::IServingSystemListener

Listener class for getting radio access technology mode preference change notification.

The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

**Public member functions**

- virtual void [onRatPreferenceChanged](#) ([RatPreference](#) preference)
- virtual void [onServiceDomainPreferenceChanged](#) ([ServiceDomainPreference](#) preference)
- virtual void [onSystemInfoChanged](#) ([ServingSystemInfo](#) sysInfo)
- virtual void [onDcStatusChanged](#) ([DcStatus](#) dcStatus)
- virtual [~IServingSystemListener](#) ()

**5.13.1.4.1 Constructors and Destructors**

**5.13.1.4.1.1** virtual [telux::tel::IServingSystemListener::~~IServingSystemListener](#) ( ) [virtual]

Destructor of [IServingSystemListener](#)

**5.13.1.4.2 Member Function Documentation**

**5.13.1.4.2.1** virtual void [telux::tel::IServingSystemListener::onRatPreferenceChanged](#) ( [RatPreference](#) *preference* ) [virtual]

This function is called whenever RAT mode preference is changed.

**Parameters**

in	<i>preference</i>	<a href="#">RatPreference</a>
----	-------------------	-------------------------------

**5.13.1.4.2.2** virtual void [telux::tel::IServingSystemListener::onServiceDomainPreferenceChanged](#) ( [ServiceDomainPreference](#) *preference* ) [virtual]

This function is called whenever service domain preference is changed.

**Parameters**

in	<i>preference</i>	<a href="#">ServiceDomainPreference</a>
----	-------------------	---

**5.13.1.4.2.3** virtual void [telux::tel::IServingSystemListener::onSystemInfoChanged](#) ( [ServingSystemInfo](#) *sysInfo* ) [virtual]

This function is called whenever the Serving System information is changed. Supports only 3GPP RATs.

**Parameters**

in	<i>sysInfo</i>	<a href="#">ServingSystemInfo</a>
----	----------------	-----------------------------------

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.13.1.4.2.4 virtual void telux::tel::IServingSystemListener::onDcStatusChanged ( DcStatus *dcStatus* ) [virtual]

This function is called whenever the Dual Connectivity status is changed on 5G NR.

**Parameters**

in	<i>dcStatus</i>	DcStatus
----	-----------------	----------

## 5.13.2 Enumeration Type Documentation

### 5.13.2.1 enum telux::tel::ServiceDomainPreference [strong]

Defines service domain preference

**Enumerator**

**UNKNOWN**  
**CS\_ONLY** Circuit-switched only  
**PS\_ONLY** Packet-switched only  
**CS\_PS** Circuit-switched and packet-switched

### 5.13.2.2 enum telux::tel::ServiceDomain [strong]

Defines service domain

**Enumerator**

**UNKNOWN** Unknown, when the information is not available  
**NO\_SRV** No Service  
**CS\_ONLY** Circuit-switched only  
**PS\_ONLY** Packet-switched only  
**CS\_PS** Circuit-switched and packet-switched  
**CAMPED** Device camped on the network according to its provisioning, but not registered

### 5.13.2.3 enum telux::tel::RatPrefType

Defines the radio access technology mode preference.

**Enumerator**

**PREF\_CDMA\_1X** CDMA\_1X  
**PREF\_CDMA\_EVDO** CDMA\_EVDO  
**PREF\_GSM** GSM  
**PREF\_WCDMA** WCDMA  
**PREF\_LTE** LTE

**PREF\_TDSCDMA** TDSCDMA  
**PREF\_NR5G** NR5G

#### 5.13.2.4 enum telux::tel::EndcAvailability [strong]

Defines ENDC(E-UTRAN New Radio-Dual Connectivity) Availability status on 5G NR

##### Enumerator

**UNKNOWN** Status unknown  
**AVAILABLE** ENDC is Available  
**UNAVAILABLE** ENDC is not Available

#### 5.13.2.5 enum telux::tel::DcnrRestriction [strong]

Defines DCNR(Dual Connectivity with NR) Restriction status on 5G NR

##### Enumerator

**UNKNOWN** Status unknown  
**RESTRICTED** DCNR is Rescticted  
**UNRESTRICTED** DCNR is not Restricted

## 5.14 Remote SIM Provisioning

This section contains APIs related to Remote SIM provisioning.

### 5.14.1 Data Structure Documentation

#### 5.14.1.1 struct telux::tel::CustomHeader

Header information to be sent along with HTTP post request.

##### Data fields

Type	Field	Description
string	name	Header name
string	value	Header value

#### 5.14.1.2 class telux::tel::IHttpTransactionListener

The interface listens for indication to perform HTTP request and send back the response for HTTP request to modem.

The methods in the listener can be invoked from multiple threads. It is client's responsibility to make sure the implementation is thread safe.

##### Public member functions

- virtual void [onNewHttpRequest](#) (const std::string &url, uint32\_t tokenId, const std::vector< [CustomHeader](#) > &headers, const std::vector< uint8\_t > &reqPayload)
- virtual [~IHttpTransactionListener](#) ()

#### 5.14.1.2.1 Constructors and Destructors

5.14.1.2.1.1 virtual telux::tel::IHttpTransactionListener::~IHttpTransactionListener ( ) [virtual]

Destructor of [IHttpTransactionListener](#)

#### 5.14.1.2.2 Member Function Documentation

5.14.1.2.2.1 virtual void telux::tel::IHttpTransactionListener::onNewHttpRequest ( const std::string & url, uint32\_t tokenId, const std::vector< [CustomHeader](#) > & headers, const std::vector< uint8\_t > & reqPayload ) [virtual]

An application handling this indication should perform the HTTP request and call the [IHttpTransactionManager::sendHttpRequest](#) to provide the result of the HTTP transaction.

##### Parameters

in	<i>url</i>	URL to sent HTTP post request.
in	<i>tokenId</i>	Token identifier.

in	<i>headers</i>	Header information to be sent along with HTTP post request.
in	<i>reqPayload</i>	Request payload.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.14.1.3 class telux::tel::IHttpTransactionManager**

[IHttpTransactionManager](#) is the interface to service HTTP related requests from the modem for SIM profile update related operations.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual [telux::common::Status](#) [sendHttpTransactionResult](#) (uint32\_t token, [HttpResult](#) result, const std::vector< [CustomHeader](#) > &headers, const std::vector< uint8\_t > &response, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) [registerListener](#) (std::weak\_ptr< [IHttpTransactionListener](#) > listener)=0
- virtual [telux::common::Status](#) [deregisterListener](#) (std::weak\_ptr< [IHttpTransactionListener](#) > listener)=0
- virtual [~IHttpTransactionManager](#) ()

**5.14.1.3.1 Constructors and Destructors**

**5.14.1.3.1.1** virtual [telux::tel::IHttpTransactionManager::~IHttpTransactionManager](#) ( ) [**virtual**]

Destructor for [IHttpTransactionManager](#)

**5.14.1.3.2 Member Function Documentation**

**5.14.1.3.2.1** virtual [telux::common::ServiceStatus](#) [telux::tel::IHttpTransactionManager::getServiceStatus](#) ( ) [**pure virtual**]

This status indicates whether the [IHttpTransactionManager](#) object is in a usable state.

**Returns**

`SERVICE_AVAILABLE` - If HTTP transaction manager is ready for service.  
`SERVICE_UNAVAILABLE` - If HTTP transaction manager is temporarily unavailable.  
`SERVICE_FAILED` - If HTTP transaction manager encountered an irrecoverable failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

```
5.14.1.3.2.2 virtual telux::common::Status telux::tel::IHttpTransactionManager::sendHttpRequest(
    Result ( uint32_t token, HttpRequest result, const std::vector< CustomHeader > &
    headers, const std::vector< uint8_t > & response, common::ResponseCallback callback
    = nullptr ) [pure virtual]
```

Send the result of HTTP Post request transaction to modem.

**Parameters**

in	<i>token</i>	Token identifier for request and response pair.
in	<i>result</i>	HTTP transaction request result.
in	<i>headers</i>	Custom Headers in HTTP Response.
in	<i>response</i>	HTTP response payload.
in	<i>callback</i>	Callback function to get the result of send HTTP transaction request.

**Returns**

Status of send HTTP transaction result i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

```
5.14.1.3.2.3 virtual telux::common::Status telux::tel::IHttpTransactionManager::registerListener (
    std::weak_ptr< IHttpTransactionListener > listener ) [pure virtual]
```

Register a listener for specific events like perform HTTP Post request.

**Parameters**

in	<i>listener</i>	Pointer of <a href="#">IHttpTransactionListener</a> object that processes the notification.
----	-----------------	---

**Returns**

Status of registerHttpListener success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.14.1.3.2.4 virtual telux::common::Status telux::tel::IHttpTransactionManager::deregisterListener ( std::weak\_ptr< IHttpTransactionListener > *listener* ) [pure virtual]

De-register the listener.

##### Parameters

in	<i>listener</i>	Pointer of <a href="#">IHttpTransactionListener</a> object that needs to be deregistered.
----	-----------------	---

##### Returns

Status of deregisterHttpListener success or suitable status code.

##### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.14.1.4 class telux::tel::SimProfile

[SimProfile](#) class represents single eUICC profile on the card.

##### Public member functions

- [SimProfile](#) (int profileId, [ProfileType](#) profileType, const std::string &iccid, bool [isActive](#), const std::string &nickName, const std::string &spn, const std::string &name, [IconType](#) iconType, std::vector< uint8\_t > icon, [ProfileClass](#) profileClass, [PolicyRuleMask](#) policyRuleMask)
- int [getSlotId](#) ()
- int [getProfileId](#) ()
- [ProfileType](#) [getType](#) ()
- const std::string & [getIccid](#) ()
- bool [isActive](#) ()
- const std::string & [getNickName](#) ()
- const std::string & [getSPN](#) ()
- const std::string & [getName](#) ()
- [IconType](#) [getIconType](#) ()
- std::vector< uint8\_t > [getIcon](#) ()
- [ProfileClass](#) [getClass](#) ()
- [PolicyRuleMask](#) [getPolicyRule](#) ()
- std::string [toString](#) ()

#### 5.14.1.4.1 Constructors and Destructors

**5.14.1.4.1.1** `telux::tel::SimProfile::SimProfile ( int profileId, ProfileType profileType, const std::string & iccid, bool isActive, const std::string & nickName, const std::string & spn, const std::string & name, IconType iconType, std::vector< uint8_t > icon, ProfileClass profileClass, PolicyRuleMask policyRuleMask )`

#### 5.14.1.4.2 Member Function Documentation

**5.14.1.4.2.1** `int telux::tel::SimProfile::getSlotId ( )`

Get slot id associated for this profile

##### Returns

SlotId

**5.14.1.4.2.2** `int telux::tel::SimProfile::getProfileId ( )`

Get profile identifier. The profile identifier is not persistently unique. It is unique for given snapshot of SIM profiles state. The profile identifier could change when any profile is deleted and added.

##### Returns

unique identifier for the profile

**5.14.1.4.2.3** `ProfileType telux::tel::SimProfile::getType ( )`

Get profile Type.

##### Returns

profile type

**5.14.1.4.2.4** `const std::string& telux::tel::SimProfile::getIccid ( )`

Get profile ICCID.

##### Returns

profile ICCID coded as in EF-ICCID

**5.14.1.4.2.5** `bool telux::tel::SimProfile::isActive ( )`

Indicates the profile state whether active or not.

##### Returns

true if profile is Active

**5.14.1.4.2.6 const std::string& telux::tel::SimProfile::getNickName ( )**

Get profile nick name.

**Returns**

profile nick name

**5.14.1.4.2.7 const std::string& telux::tel::SimProfile::getSPN ( )**

Get profile service provider name.

**Returns**

profile service provider name.

**5.14.1.4.2.8 const std::string& telux::tel::SimProfile::getName ( )**

Get profile name.

**Returns**

profile name

**5.14.1.4.2.9 IconType telux::tel::SimProfile::getIconType ( )**

Get profile icon type.

**Returns**

profile icon type

**5.14.1.4.2.10 std::vector<uint8\_t> telux::tel::SimProfile::getIcon ( )**

Get profile icon content.

**Returns**

profile icon content

**5.14.1.4.2.11 ProfileClass telux::tel::SimProfile::getClass ( )**

Get profile class.

**Returns**

profile class

#### 5.14.1.4.2.12 PolicyRuleMask telux::tel::SimProfile::getPolicyRule ( )

Get profile policy rules.

##### Returns

mask of profile policy rules

#### 5.14.1.4.2.13 std::string telux::tel::SimProfile::toString ( )

Get the text related informative representation of this object.

##### Returns

String containing informative string.

### 5.14.1.5 class telux::tel::ISimProfileListener

The interface listens for profile download indication and keep track of download and install progress of profile.

The methods in the listener can be invoked from multiple threads. It is client's responsibility to make sure the implementation is thread safe.

#### Public member functions

- virtual void [onDownloadStatus](#) (SlotId slotId, [DownloadStatus](#) status, [DownloadErrorCause](#) cause)
- virtual void [onUserDisplayInfo](#) (SlotId slotId, bool userConsentRequired, [PolicyRuleMask](#) mask)
- virtual void [onConfirmationCodeRequired](#) (SlotId slotId, std::string profileName)
- virtual [~ISimProfileListener](#) ()

#### 5.14.1.5.1 Constructors and Destructors

##### 5.14.1.5.1.1 virtual telux::tel::ISimProfileListener::~~ISimProfileListener ( ) [virtual]

Destructor of [ISimProfileListener](#)

#### 5.14.1.5.2 Member Function Documentation

##### 5.14.1.5.2.1 virtual void telux::tel::ISimProfileListener::onDownloadStatus ( SlotId *slotId*, [DownloadStatus](#) *status*, [DownloadErrorCause](#) *cause* ) [virtual]

This function is called when indication about status of profile download and installation comes.

**Parameters**

in	<i>slotId</i>	Slot on which profile get downloaded and installed.
in	<i>status</i>	<a href="#">telux::tel::DownloadStatus</a> .
in	<i>cause</i>	<a href="#">telux::tel::DownloadErrorCause</a> .

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.14.1.5.2.2 virtual void telux::tel::ISimProfileListener::onUserDisplayInfo ( SlotId *slotId*, bool *userConsentRequired*, PolicyRuleMask *mask* ) [virtual]

This function is invoked when information about user consent and profile policy rules is received. The client application is expected to provide user consent for download and install profile by calling [telux::tel::ISimProfileManager::provideUserConsent](#) if user consent is expected.

**Parameters**

in	<i>slotId</i>	Slot on which profile get downloaded and installed.
in	<i>userConsent↔ Required</i>	User consent required or not. If true it means user is expected to provide consent for download and install.
in	<i>mask</i>	telux::tel::PprMask (Profile policy rules Mask)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.14.1.5.2.3 virtual void telux::tel::ISimProfileListener::onConfirmationCodeRequired ( SlotId *slotId*, std::string *profileName* ) [virtual]

This function is invoked when confirmation code is required. The client application is expected to provide confirmation code for download and install profile by calling [telux::tel::ISimProfileManager::provideConfirmationCode](#)

**Parameters**

in	<i>slotId</i>	Slot on which profile get downloaded and installed.
in	<i>profileName</i>	Profile name corresponding to which confirmation code is required.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.14.1.6 class telux::tel::ISimProfileManager

[ISimProfileManager](#) is a primary interface for remote eUICCs (eSIMs or embedded SIMs) provisioning. This interface provides APIs to add, delete, set profile, update nickname, provide user consent, get Eid on the eUICC.

#### Public member functions

- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::Status addProfile](#) (SlotId slotId, const std::string &activationCode, const std::string &confirmationCode="", bool userConsentSupported=false, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status deleteProfile](#) (SlotId slotId, int profileId, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status setProfile](#) (SlotId slotId, int profileId, bool enable=false, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status updateNickName](#) (SlotId slotId, int profileId, const std::string &nickName, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status requestProfileList](#) (SlotId slotId, [ProfileListResponseCb](#) callback)=0
- virtual [telux::common::Status requestEid](#) (SlotId slotId, [EidResponseCb](#) callback)=0
- virtual [telux::common::Status provideUserConsent](#) (SlotId slotId, bool userConsent, [UserConsentReasonType](#) reason, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status provideConfirmationCode](#) (SlotId slotId, std::string code, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status requestServerAddress](#) (SlotId slotId, [ServerAddressResponseCb](#) callback)=0
- virtual [telux::common::Status setServerAddress](#) (SlotId slotId, const std::string &smdpAddress, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status memoryReset](#) (SlotId slotId, [ResetOptionMask](#) mask, [common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status registerListener](#) (std::weak\_ptr< [ISimProfileListener](#) > listener)=0
- virtual [telux::common::Status deregisterListener](#) (std::weak\_ptr< [ISimProfileListener](#) > listener)=0
- virtual [~ISimProfileManager](#) ()

#### 5.14.1.6.1 Constructors and Destructors

5.14.1.6.1.1 virtual [telux::tel::ISimProfileManager::~~ISimProfileManager](#) ( ) [[virtual](#)]

Destructor for [ISimProfileManager](#)

### 5.14.1.6.2 Member Function Documentation

#### 5.14.1.6.2.1 `virtual bool telux::tel::ISimProfileManager::isSubsystemReady ( ) [pure virtual]`

Checks if the eUICC subsystem is ready.

#### Returns

True if [ISimProfileManager](#) is ready for service, otherwise returns false.

#### 5.14.1.6.2.2 `virtual std::future<bool> telux::tel::ISimProfileManager::onSubsystemReady ( ) [pure virtual]`

Wait for eUICC subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when card manager is ready.

#### 5.14.1.6.2.3 `virtual telux::common::Status telux::tel::ISimProfileManager::addProfile ( SlotId slotId, const std::string & activationCode, const std::string & confirmationCode = "", bool userConsentSupported = false, common::ResponseCallback callback = nullptr ) [pure virtual]`

Add new profile to eUICC card and download and install the profile on eUICC.

#### Parameters

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>activationCode</i>	Activation code.
in	<i>confirmationCode</i>	Optional confirmation code required for downloading the profile.
in	<i>userConsentSupported</i>	Optional User consent supported or not.
in	<i>callback</i>	Optional callback function to get the result of add profile.

#### Returns

Status of add profile i.e. success or suitable error code.

#### 5.14.1.6.2.4 `virtual telux::common::Status telux::tel::ISimProfileManager::deleteProfile ( SlotId slotId, int profileId, common::ResponseCallback callback = nullptr ) [pure virtual]`

Delete profile from eUICC card.

1. Deletion of enabled profile a) This API will disable the profile first and then delete it. b) The profile is associated with profile policy rules (PPRs) so before disabling the profile, this API checks if the PPRs [telux::tel::PolicyRuleType](#) allow the operation. c) If the policy rules are not set, then first disabling of profile happens followed by deletion of profile. d) If disable succeeds but deletion fails, then the API

attempts to roll back the profile back to the original (enabled) state. e) If rollback fails due to any reason such as eUICC being in incompatible state then the profile will be in disabled state and the API will return `telux::common::ErrorCode::ROLLBACK_FAILED`

2. Deletion of disabled profile
  - a) This API checks the PPR `telux::tel::PolicyRuleType::PROFILE_DELETE_NOT_ALLOWED` before deletion of profile.
  - b) If the PPR is not set, then deletion of profile is performed. If the PPR is set, then the API returns `telux::common::ErrorCode::OPERATION_NOT_ALLOWED`.

### Parameters

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>profileId</i>	Profile identifier
in	<i>callback</i>	Optional callback function to get the result of delete profile.

### Returns

Status of delete profile i.e. success or suitable error code.

**5.14.1.6.2.5** `virtual telux::common::Status telux::tel::ISimProfileManager::setProfile ( SlotId slotId, int profileId, bool enable = false, common::ResponseCallback callback = nullptr ) [pure virtual]`

Enable or disable profile which allows to switch to other profile on eUICC card.

### Parameters

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>profileId</i>	Profile identifier.
in	<i>enable</i>	Indicates whether a profile must be enabled or disabled. true - Enable and false - Disable.
in	<i>callback</i>	Optional callback function to get the result of set profile.

### Returns

Status of set profile i.e. success or suitable error code.

**5.14.1.6.2.6** `virtual telux::common::Status telux::tel::ISimProfileManager::updateNickName ( SlotId slotId, int profileId, const std::string & nickName, common::ResponseCallback callback = nullptr ) [pure virtual]`

Update nick name of the profile

### Parameters

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>profileId</i>	Profile identifier
in	<i>nickName</i>	New nick name for profile.
in	<i>callback</i>	Optional callback function to get the result of update nickname.

**Returns**

Status of update nick name i.e. success or suitable error code.

#### 5.14.1.6.2.7 **virtual telux::common::Status telux::tel::ISimProfileManager::requestProfileList ( SlotId slotId, ProfileListResponseCb callback ) [pure virtual]**

Request list of profiles supported by the eUICC card.

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>callback</i>	Callback function to get the result of request profile list.

**Returns**

Status of request profile list i.e. success or suitable error code.

#### 5.14.1.6.2.8 **virtual telux::common::Status telux::tel::ISimProfileManager::requestEid ( SlotId slotId, EidResponseCb callback ) [pure virtual]**

Request eUICC identifier(EID) for the slot.

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>callback</i>	Callback function to get the result of request EID.

**Returns**

Status of request EID.e. success or suitable error code.

#### 5.14.1.6.2.9 **virtual telux::common::Status telux::tel::ISimProfileManager::provideUserConsent ( SlotId slotId, bool userConsent, UserConsentReasonType reason, common::ResponseCallback callback = nullptr ) [pure virtual]**

Provide user consent required for downloading and installing profile. This API should be called in response to [telux::tel::ISimProfileListener::onUserDisplayInfo](#).

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>userConsent</i>	Consent for profile download and install. True means user consent given to download and install.
in	<i>reason</i>	Reason for not providing user consent to download and install. <a href="#">telux::tel::UserConsentReasonType</a>
in	<i>callback</i>	Optional callback function to get the result of user consent request.

**Returns**

Status of user consent request i.e. success or suitable error code.

**5.14.1.6.2.10** `virtual telux::common::Status telux::tel::ISimProfileManager::provideConfirmationCode ( SlotId slotId, std::string code, common::ResponseCallback callback = nullptr ) [pure virtual]`

Provide confirmation code required for downloading and installing profile. This API should be called in response to [telux::tel::ISimProfileListener::onConfirmationCodeRequired](#).

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>code</i>	Confirmation code for profile download and install.
in	<i>callback</i>	Optional callback function to get the result of confirmation request.

**Returns**

Status of provide confirmation code i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.14.1.6.2.11** `virtual telux::common::Status telux::tel::ISimProfileManager::requestServerAddress ( SlotId slotId, ServerAddressResponseCb callback ) [pure virtual]`

Get Subscription Manager Data Preparation (SM-DP+) address and the Subscription Manager Discovery Server (SMDS) address configured on the eUICC.

**Parameters**

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>callback</i>	Callback function to get the result of server address request.

**Returns**

Status of server address request i.e. success or suitable error code.

**5.14.1.6.2.12** `virtual telux::common::Status telux::tel::ISimProfileManager::setServerAddress ( SlotId slotId, const std::string & smdpAddress, common::ResponseCallback callback = nullptr ) [pure virtual]`

Set Subscription Manager Data Preparation (SM-DP+) address on the eUICC. If SMDP+ address length is zero then the existing SM-DP+ address on the eUICC is removed

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>smdpAddress</i>	SM-DP+ address to be configured on the eUICC.
in	<i>callback</i>	Optional Callback function to get the result of set SM-DP+ request.

### Returns

Status of set server address request i.e. success or suitable error code.

**5.14.1.6.2.13** `virtual telux::common::Status telux::tel::ISimProfileManager::memoryReset ( SlotId slotId, ResetOptionMask mask, common::ResponseCallback callback = nullptr ) [pure virtual]`

Resets the memory of the eUICC card based on [telux::tel::ResetOptionMask](#).

### Parameters

in	<i>slotId</i>	Slot identifier corresponding to the card.
in	<i>mask</i>	Memory reset options mask <a href="#">telux::tel::ResetOptionMask</a>
in	<i>callback</i>	Optional Callback function to get the result of memory reset request.

### Returns

Status of memory reset request i.e. success or suitable error code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.14.1.6.2.14** `virtual telux::common::Status telux::tel::ISimProfileManager::registerListener ( std::weak_ptr< ISimProfileListener > listener ) [pure virtual]`

Register a listener to listen for status of specific events like download and installation of profile on eUICC.

### Parameters

in	<i>listener</i>	Pointer of <a href="#">ISimProfileListener</a> object that processes the notification.
----	-----------------	--

### Returns

Status of registerListener success or suitable status code

**5.14.1.6.2.15** `virtual telux::common::Status telux::tel::ISimProfileManager::deregisterListener ( std::weak_ptr< ISimProfileListener > listener ) [pure virtual]`

De-register the listener.

in	<i>listener</i>	Pointer of <a href="#">ISimProfileListener</a> object that needs to be removed
----	-----------------	--

## Returns

Status of deregisterListener success or suitable status code

## 5.14.2 Enumeration Type Documentation

### 5.14.2.1 enum telux::tel::HttpResult [strong]

Defines the HTTP request result.

#### Enumerator

**TRANSACTION\_SUCCESSFUL** HTTP request successful

**UNKNOWN\_ERROR** Unknown error

**HTTP\_SERVER\_ERROR** Server error

**HTTP\_TLS\_ERROR** TLS error

**HTTP\_NETWORK\_ERROR** Network error

### 5.14.2.2 enum telux::tel::ProfileType [strong]

Indicates profile type of card

#### Enumerator

**UNKNOWN**

**REGULAR** Regular profile

**EMERGENCY** Emergency profile

### 5.14.2.3 enum telux::tel::IconType [strong]

Indicates profile icon type.

#### Enumerator

**NONE** No icon information

**JPEG** JPEG icon

**PNG** PNG icon

### 5.14.2.4 enum telux::tel::ProfileClass [strong]

Indicates profile class.

**Enumerator**

**UNKNOWN** No info about profile class  
**TEST** Test profile  
**PROVISIONING** Provisioning profile  
**OPERATIONAL** Operational profile

**5.14.2.5 enum telux::tel::DownloadStatus [strong]**

Indicates profile download status.

**Enumerator**

**DOWNLOAD\_ERROR** Profile download error  
**DOWNLOAD\_INSTALLATION\_COMPLETE** Profile download and installation is complete

**5.14.2.6 enum telux::tel::DownloadErrorCause [strong]**

Indicates profile download error cause.

**Enumerator**

**GENERIC** Generic error  
**SIM** Error from the SIM card  
**NETWORK** Error from the network  
**MEMORY** Error due to no memory  
**UNSUPPORTED\_PROFILE\_CLASS** Unsupported profile class  
**PPR\_NOT\_ALLOWED** Profile policy rules not allowed  
**END\_USER\_REJECTION** End user rejection  
**END\_USER\_POSTPONED** End user postponed

**5.14.2.7 enum telux::tel::UserConsentReasonType [strong]**

Indicates the reason for user consent not provided.

**Enumerator**

**END\_USER\_REJECTION** End user rejection  
**END\_USER\_POSTPONED** End user postponed

**5.14.2.8 enum telux::tel::PolicyRuleType**

Defines profile policy rules(PPR). Each value represents corresponding bit for PprMask bitset.

**Enumerator**

**PROFILE\_DISABLE\_NOT\_ALLOWED** Disabling of the profile is not allowed  
**PROFILE\_DELETE\_NOT\_ALLOWED** Deletion of the profile is not allowed  
**PROFILE\_DELETE\_ON\_DISABLE** Deletion of the profile is required on successful disabling

### 5.14.2.9 enum telux::tel::ResetOption

Defines memory reset options. Each value represents corresponding bit for ResetOptionMask bitset.

#### Enumerator

**TEST\_PROFILES** Delete all the test profiles

**OPERATIONAL\_PROFILE** Delete all operational profiles

**DEFAULT\_SMDP\_ADDRESS** Reset the default SM-DP+ address

## 5.15 Remote SIM

This section contains APIs related to Remote SIM operations.

### 5.15.1 Data Structure Documentation

#### 5.15.1.1 class telux::tel::IRemoteSimListener

A listener class for getting remote SIM notifications.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

##### Public member functions

- virtual void [onAduTransfer](#) (const unsigned int id, const std::vector< uint8\_t > &apdu)
- virtual void [onCardConnect](#) ()
- virtual void [onCardDisconnect](#) ()
- virtual void [onCardPowerUp](#) ()
- virtual void [onCardPowerDown](#) ()
- virtual void [onCardReset](#) ()
- virtual [~IRemoteSimListener](#) ()

##### 5.15.1.1.1 Constructors and Destructors

5.15.1.1.1.1 virtual telux::tel::IRemoteSimListener::~IRemoteSimListener ( ) [virtual]

Destructor of [IRemoteSimListener](#)

##### 5.15.1.1.2 Member Function Documentation

5.15.1.1.2.1 virtual void telux::tel::IRemoteSimListener::onAduTransfer ( const unsigned int *id*, const std::vector< uint8\_t > & *apdu* ) [virtual]

This function is called when the modem wants to transmit a command APDU.

##### Parameters

in	<i>id</i>	Identifier for a command and response APDU pair
in	<i>apdu</i>	APDU request sent to the control point (max size = 261, per ETSI TS 102 221, section 10.1.4)

5.15.1.1.2.2 virtual void telux::tel::IRemoteSimListener::onCardConnect ( ) [virtual]

This function is called when the modem wants to establish a connection.

**5.15.1.1.2.3 virtual void telux::tel::IRemoteSimListener::onCardDisconnect ( ) [virtual]**

This function is called when the modem wants to tear down a connection.

**5.15.1.1.2.4 virtual void telux::tel::IRemoteSimListener::onCardPowerUp ( ) [virtual]**

This function is called when the modem wants to power up the card.

**5.15.1.1.2.5 virtual void telux::tel::IRemoteSimListener::onCardPowerDown ( ) [virtual]**

This function is called when the modem wants to power down the card.

**5.15.1.1.2.6 virtual void telux::tel::IRemoteSimListener::onCardReset ( ) [virtual]**

This function is called when the modem wants to warm reset the card.

**5.15.1.2 class telux::tel::IRemoteSimManager**

[IRemoteSimManager](#) provides APIs for remote SIM related operations. This allows a device to use a SIM card on another device for its WWAN modem functionality. The SIM provider service is the endpoint that interfaces with the SIM card (e.g. over bluetooth) and sends/receives data to the other endpoint, the modem. The modem sends requests to the SIM provider service to interact with the SIM card (e.g. power up, transmit APDU, etc.), and is notified of events (e.g. card errors, resets, etc.). This API is used by the SIM provider endpoint to provide a SIM card to the modem.

### 5.15.1.2.1 Constructors and Destructors

5.15.1.2.1.1 virtual `telux::tel::IRemoteSimManager::~~IRemoteSimManager` ( ) [`virtual`]

Destructor of `IRemoteSimManager`

### 5.15.1.2.2 Member Function Documentation

5.15.1.2.2.1 virtual bool `telux::tel::IRemoteSimManager::isSubsystemReady` ( ) [`pure virtual`]

Checks the status of remote SIM subsystem and returns the result.

#### Returns

True if remote SIM subsystem is ready for service otherwise false.

5.15.1.2.2.2 virtual `std::future<bool> telux::tel::IRemoteSimManager::onSubsystemReady` ( ) [`pure virtual`]

Wait for remote SIM subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when remote SIM subsystem is ready.

5.15.1.2.2.3 virtual `telux::common::Status telux::tel::IRemoteSimManager::sendReset` ( `telux::common::ResponseCallback` *callback* = `nullptr` ) [`pure virtual`]

Send reset command to the modem to reset state variables.

#### Parameters

<code>out</code>	<i>callback</i>	Callback function pointer to get the response of <code>sendReset</code> .
------------------	-----------------	---

#### Returns

Status of `sendReset` i.e. success or suitable status code.

#### 5.15.1.2.2.4 virtual telux::common::Status telux::tel::IRemoteSimManager::sendConnectionAvailable ( telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]

Send connection available event to the modem.

##### Parameters

out	<i>callback</i>	Callback function pointer to get the response.
-----	-----------------	--

##### Returns

Status of sendConnectionAvailable i.e. success or suitable status code.

#### 5.15.1.2.2.5 virtual telux::common::Status telux::tel::IRemoteSimManager::sendConnectionUnavailable ( telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]

Send connection unavailable event to the modem.

##### Parameters

out	<i>callback</i>	Callback function pointer to get the response.
-----	-----------------	--

##### Returns

Status of sendConnectionUnavailable i.e. success or suitable status code.

#### 5.15.1.2.2.6 virtual telux::common::Status telux::tel::IRemoteSimManager::sendCardReset ( const std::vector< uint8\_t > & *atr*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]

Send card reset event to the modem.

##### Parameters

in	<i>atr</i>	Answer to Reset bytes (max size = 32, per ISO/IEC 7816-3:2006 section 8.1).
out	<i>callback</i>	Callback function pointer to get the response of sendCardReset.

##### Returns

Status of sendCardReset i.e. success or suitable status code.

#### 5.15.1.2.2.7 virtual telux::common::Status telux::tel::IRemoteSimManager::sendCardError ( const CardErrorCause *cause* = CardErrorCause::INVALID, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]

Send card error event to the modem.

in	<i>cause</i>	Card Error cause.
out	<i>callback</i>	Callback function pointer to get the response of sendCardError.

**Returns**

Status of sendCardError i.e. success or suitable status code.

**5.15.1.2.2.8** `virtual telux::common::Status telux::tel::IRemoteSimManager::sendCardInserted ( const std::vector< uint8_t > & atr, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Send card inserted event to the modem.

**Parameters**

in	<i>atr</i>	Answer to Reset bytes (max size = 32, per ISO/IEC 7816-3:2006 section 8.1).
out	<i>callback</i>	Callback function pointer to get the response of sendCardInserted.

**Returns**

Status of sendCardInserted i.e. success or suitable status code.

**5.15.1.2.2.9** `virtual telux::common::Status telux::tel::IRemoteSimManager::sendCardRemoved ( telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Send card removed event to the modem.

**Parameters**

out	<i>callback</i>	Callback function pointer to get the response of sendCardRemoved.
-----	-----------------	---

**Returns**

Status of sendCardRemoved i.e. success or suitable status code.

**5.15.1.2.2.10** `virtual telux::common::Status telux::tel::IRemoteSimManager::sendCardWakeup ( telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Send card wakeup event to the modem.

**Parameters**

out	<i>callback</i>	Callback function pointer to get the response of sendCardWakeup.
-----	-----------------	--

**Returns**

Status of sendCardWakeup i.e. success or suitable status code.

**5.15.1.2.2.11** `virtual telux::common::Status telux::tel::IRemoteSimManager::sendApdu ( const unsigned int id, const std::vector< uint8_t > & apdu, const bool isSuccess = true, const unsigned int totalSize = 0, const unsigned int offset = 0, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Sends an APDU message to the modem, in response to a previous APDU sent by the modem.

**Parameters**

in	<i>id</i>	Identifier for command and response APDU pair.
in	<i>apdu</i>	Response APDU (max size = 1024).
in	<i>isSuccess</i>	Whether APDU transaction completed successfully.
in	<i>totalSize</i>	Total length of the APDU message (used when the response is larger than 1024 bytes and must be passed in multiple segments).
in	<i>offset</i>	Offset of this APDU segment in the original message.
out	<i>callback</i>	Callback function pointer to get the response of sendApdu.

**Returns**

Status of sendApdu i.e. success or suitable status code.

**5.15.1.2.2.12** `virtual telux::common::Status telux::tel::IRemoteSimManager::registerListener ( std::weak_ptr< IRemoteSimListener > listener ) [pure virtual]`

Register a listener for specific updates from the modem.

**Parameters**

in	<i>listener</i>	Pointer of <a href="#">IRemoteSimListener</a> object that processes the notification
----	-----------------	--

**Returns**

Status of registerListener i.e success or suitable status code.

**5.15.1.2.2.13** `virtual telux::common::Status telux::tel::IRemoteSimManager::deregisterListener ( std::weak_ptr< IRemoteSimListener > listener ) [pure virtual]`

Deregister the previously added listener.

**Parameters**

in	<i>listener</i>	Previously registered <a href="#">IRemoteSimListener</a> that needs to be deregistered
----	-----------------	--

**Returns**

Status of deregisterListener success or suitable status code

**5.15.1.2.2.14 virtual int telux::tel::IRemoteSimManager::getSlotId ( ) [pure virtual]**

Get associated slot ID for the RemoteSimManager

**Returns**

The slot ID associated with this [IRemoteSimManager](#)

**5.15.2 Enumeration Type Documentation****5.15.2.1 enum telux::tel::CardErrorCause [strong]**

Defines the card error cause, sent to the modem by the SIM provider

**Enumerator**

**INVALID** Card error cause value will not be passed to modem

**UNKNOWN\_ERROR** Unknown error

**NO\_LINK\_ESTABLISHED** No link was established

**COMMAND\_TIMEOUT** Command timeout

**POWER\_DOWN** Error due to a card power down

This section contains APIs related to Location Services.

### 5.17.1 Data Structure Documentation

#### 5.17.1.1 class `telux::loc::IDgnssStatusListener`

Listener class for getting RTCM injection event notification information.

##### Public member functions

- virtual void `onDgnssStatusUpdate` (`DgnssStatus` status)
- virtual `~IDgnssStatusListener` ()

##### 5.17.1.1.1 Constructors and Destructors

###### 5.17.1.1.1.1 virtual `telux::loc::IDgnssStatusListener::~~IDgnssStatusListener` ( ) [`virtual`]

Destructor of `IRTCMStatusListener`

##### 5.17.1.1.2 Member Function Documentation

###### 5.17.1.1.2.1 virtual void `telux::loc::IDgnssStatusListener::onDgnssStatusUpdate` ( `DgnssStatus status` ) [`virtual`]

This function is called asynchronously to report RTCM injection status

##### Parameters

<code>in</code>	<code>status</code>	- the status enum.
-----------------	---------------------	--------------------

#### 5.17.1.2 class `telux::loc::IDgnssManager`

`IRtcMManager` provides interface to inject RTCM data into modem, register event listener reported by `cdfw`(correction data framework).

##### Public member functions

- virtual bool `isSubsystemReady` ()=0
- virtual `telux::common::ServiceStatus` `getServiceStatus` ()=0
- virtual `std::future< bool >` `onSubsystemReady` ()=0
- virtual `telux::common::Status` `registerListener` (`std::weak_ptr< IDgnssStatusListener >` listener)=0
- virtual `telux::common::Status` `deRegisterListener` (void)=0
- virtual `telux::common::Status` `createSource` (`DgnssDataFormat` dataFormat)=0

- virtual [telux::common::Status releaseSource](#) (void)=0
- virtual [telux::common::Status injectCorrectionData](#) (const uint8\_t \*buffer, uint32\_t bufferSize)=0
- virtual [~IDgnssManager](#) ()

### 5.17.1.2.1 Constructors and Destructors

5.17.1.2.1.1 **virtual telux::loc::IDgnssManager::~~IDgnssManager ( ) [virtual]**

Destructor of IRtcmManager

### 5.17.1.2.2 Member Function Documentation

5.17.1.2.2.1 **virtual bool telux::loc::IDgnssManager::isSubsystemReady ( ) [pure virtual]**

Checks the status of location subsystems and returns the result.

#### Returns

True if location subsystem is ready for service otherwise false.

**Deprecated** use [getServiceStatus\(\)](#)

5.17.1.2.2.2 **virtual telux::common::ServiceStatus telux::loc::IDgnssManager::getServiceStatus ( ) [pure virtual]**

This status indicates whether the object is in a usable state.

#### Returns

SERVICE\_AVAILABLE - If Dgnss manager is ready for service. SERVICE\_UNAVAILABLE - If Dgnss manager is temporarily unavailable. SERVICE\_FAILED - If Dgnss manager encountered an irrecoverable failure.

5.17.1.2.2.3 **virtual std::future<bool> telux::loc::IDgnssManager::onSubsystemReady ( ) [pure virtual]**

Wait for location subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when location subsystem is ready.

**Deprecated** The callback mechanism introduced in the [LocationFactory::getDgnssManager\(\)](#) API will provide the similar notification mechanism as [onSubsystemReady\(\)](#). This API will soon be removed from further releases.

**5.17.1.2.2.4** `virtual telux::common::Status telux::loc::IDgnssManager::registerListener ( std::weak_ptr< IDgnssStatusListener > listener ) [pure virtual]`

Register a listener for Dgnss injection status update.

#### Parameters

in	<i>listener</i>	- Pointer of <a href="#">IDgnssStatusListener</a> object that processes the notification.
----	-----------------	---

#### Returns

Status of registerListener i.e success or suitable status code.

**5.17.1.2.2.5** `virtual telux::common::Status telux::loc::IDgnssManager::deRegisterListener ( void ) [pure virtual]`

deRegister a listener for Dgnss injection status update.

#### Returns

Status of registerListener i.e success or suitable status code.

**5.17.1.2.2.6** `virtual telux::common::Status telux::loc::IDgnssManager::createSource ( DgnssDataFormat dataFormat ) [pure virtual]`

Create a Dgnss injection source. Only one source is permitted at any given time. If a new source is to be used, user must call [releaseSource\(\)](#) to release previous source before calling this function.

#### Parameters

in	<i>format</i>	Dgnss injection data format.
----	---------------	------------------------------

#### Returns

Success of suitable status code

**5.17.1.2.2.7** `virtual telux::common::Status telux::loc::IDgnssManager::releaseSource ( void ) [pure virtual]`

Release current Dgnss injection source (previously created by [createSource\(\)](#) call) This function is to be called if it's determined that current injection data is not suitable anymore, and a new source will be created and used as injection source.

#### Parameters

<i>none</i>	
-------------	--

**Returns**

none

**5.17.1.2.2.8 virtual telux::common::Status telux::loc::IDgnssManager::injectCorrectionData ( const uint8\_t\* *buffer*, uint32\_t *bufferSize* ) [pure virtual]**

Inject correction data This function is to be called when a source has been created, either through a explicit call to [createSource\(\)](#), or after DgnssManager object was instantiated through the factory method(The factory method create a default source for DgnssManager object).

**Parameters**

in	<i>buffer</i>	buffer contains the data to be injected.
in	<i>bufferSize</i>	size of the buffer.

**Returns**

success or suitable status code.

**5.17.1.3 class telux::loc::ILocationConfigurator**

[ILocationConfigurator](#) allows general engine configurations (example: TUNC, PACE etc), configuration of specific engines like SPE (example: minSVElevation, minGPSWeek etc) or DRE, deletion of warm and cold aiding data, NMEA configuration and support for XTRA feature. [ILocationConfigurator](#) APIs strictly adheres to the principle of single client per process.

**Public Types**

- using [GetSecondaryBandCallback](#) = std::function< void(const [telux::loc::ConstellationSet](#) set, [telux::common::ErrorCode](#) error)>
- using [GetMinGpsWeekCallback](#) = std::function< void(uint16\_t minGpsWeek, [telux::common::ErrorCode](#) error)>
- using [GetMinSVElevationCallback](#) = std::function< void(uint8\_t minSVElevation, [telux::common::ErrorCode](#) error)>
- using [GetRobustLocationCallback](#) = std::function< void(const [telux::loc::RobustLocationConfiguration](#) rLConfig, [telux::common::ErrorCode](#) error)>
- using [GetXtraStatusCallback](#) = std::function< void(const [telux::loc::XtraStatus](#) xtraStatus, [telux::common::ErrorCode](#) error)>

- virtual `~ILocationConfigurator ()`

### 5.17.1.3.1 Member Typedef Documentation

**5.17.1.3.1.1** `using telux::loc::ILocationConfigurator::GetSecondaryBandCallback = std::function<void(const telux::loc::ConstellationSet set, telux::common::ErrorCode error)>`

This function is called with the response to requestSecondaryBandConfig API.

#### Parameters

in	<i>set</i>	- disabled secondary band constellation configuration used by the GNSS standard position engine (SPE).
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

**5.17.1.3.1.2** `using telux::loc::ILocationConfigurator::GetMinGpsWeekCallback = std::function<void(uint16_t minGpsWeek, telux::common::ErrorCode error)>`

This function is called with the response to requestMinGpsWeek API.

#### Parameters

in	<i>minGpsWeek</i>	- minimum gps week.
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

**5.17.1.3.1.3** `using telux::loc::ILocationConfigurator::GetMinSVElevationCallback = std::function<void(uint8_t minSVElevation, telux::common::ErrorCode error)>`

This function is called with the response to requestMinSVElevation API.

#### Parameters

in	<i>minSVElevation</i>	- minimum SV Elevation angle in units of degree.
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

**5.17.1.3.1.4** using `telux::loc::ILocationConfigurator::GetRobustLocationCallback = std::function<void(const telux::loc:: RobustLocationConfiguration rLConfig, telux::common::ErrorCode error)>`

This function is called with the response to requestRobustLocation API.

#### Parameters

in	<i>rLConfig</i>	- robust location settings information.
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

**5.17.1.3.1.5** using `telux::loc::ILocationConfigurator::GetXtraStatusCallback = std::function<void(const telux::loc::XtraStatus xtraStatus, telux::common::ErrorCode error)>`

This function is called with the response to requestXtraStatus API.

#### Parameters

in	<i>xtraStatus</i>	- Information pertaining to Xtra assistance data.
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

### 5.17.1.3.2 Constructors and Destructors

**5.17.1.3.2.1** virtual `telux::loc::ILocationConfigurator::~~ILocationConfigurator ( ) [virtual]`

Destructor of [ILocationConfigurator](#)

### 5.17.1.3.3 Member Function Documentation

**5.17.1.3.3.1** virtual `bool telux::loc::ILocationConfigurator::isSubsystemReady ( ) [pure virtual]`

Checks the status of location configuration subsystems and returns the result.

#### Returns

True if location configuration subsystem is ready for service otherwise false.

**Deprecated** use `getServiceStatus()`

**5.17.1.3.3.2** `virtual telux::common::ServiceStatus telux::loc::ILocationConfigurator::getServiceStatus ( ) [pure virtual]`

This status indicates whether the object is in a usable state.

#### Returns

SERVICE\_AVAILABLE - If location configurator is ready for service. SERVICE\_UNAVAILABLE - If location configurator is temporarily unavailable. SERVICE\_FAILED - If location configurator encountered an irrecoverable failure.

**5.17.1.3.3.3** `virtual std::future<bool> telux::loc::ILocationConfigurator::onSubsystemReady ( ) [pure virtual]`

Wait for location configuration subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when location configuration subsystem is ready.

**Deprecated** The callback mechanism introduced in the [LocationFactory::getLocationConfigurator\(\)](#) API will provide the similar notification mechanism as [onSubsystemReady\(\)](#). This API will soon be removed from further releases.

**5.17.1.3.3.4** `virtual telux::common::Status telux::loc::ILocationConfigurator::configureC↔Tunc ( bool enable, telux::common::ResponseCallback callback = nullptr, float timeUncertainty = DEFAULT_TUNC_THRESHOLD, uint32_t energyBudget = DEFAULT_TUNC_ENERGY_THRESHOLD ) [pure virtual]`

This API enables or disables the constrained time uncertainty(C-TUNC) feature. When the vehicle is turned off this API helps to put constraint on the time uncertainty. For multiple invocations of this API, client should wait for the command to finish, e.g.: via ResponseCallback received before issuing a second configureCTunc command. Behavior is not defined if client issues a second request of configureCTunc without waiting for the finish of the previous configureCTunc request.

#### Parameters

in	<i>enable</i>	- true for enable C-TUNC feature and false for disable C-TUNC feature.
in	<i>callback</i>	- Optional callback to get the response of enablement/disablement of C-TUNC.
in	<i>timeUncertainty</i>	- specifies the time uncertainty threshold that gps engine needs to maintain, in unit of milli-seconds. This parameter is ignored when the request is to disable this feature.
in	<i>energyBudget</i>	- specifies the power budget that the GPS engine is allowed to spend to maintain the time uncertainty, in the unit of 100 micro watt second. If the power exceeds the energyBudget then this API is disabled. This is a cumulative energy budget. This parameter is ignored when the request is to disable this feature.

## Returns

Status of configureCTunc i.e. success or suitable status code.

### 5.17.1.3.3.5 `virtual telux::common::Status telux::loc::ILocationConfigurator::configurePACE ( bool enable, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API enables or disables position assisted clock estimator feature. For multiple invocations of this API, client should wait for the command to finish, e.g.: via ResponseCallback received before issuing a second configurePACE command. Behavior is not defined if client issues a second request of configurePACE without waiting for the finish of the previous configurePACE request.

#### Parameters

in	<i>enable</i>	- to enable/disable position assisted clock estimator feature.
in	<i>callback</i>	- Optional callback to get the response of enablement/disablement of PACE.

### 5.17.1.3.3.6 `virtual telux::common::Status telux::loc::ILocationConfigurator::deleteAllAidingData ( telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API deletes all forms of aiding data from all position engines. This API deletes all assistance data used by GPS engine and force engine to do a cold start for next session. Invoking this API will trigger cold start of all position engines on the device and will cause significant delay for the position engines to produce next fix and may have other performance impact. So, this API should only be exercised with caution and only for very limited usage scenario, e.g.: for performance test and certification process.

#### Parameters

in	<i>callback</i>	- Optional callback to get the response of delete aiding data.
----	-----------------	--

### 5.17.1.3.3.7 `virtual telux::common::Status telux::loc::ILocationConfigurator::configureLeverArm ( const LeverArmConfigInfo & info, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API sets the lever arm parameters for the vehicle. LeverArm is system level parameters and it is not expected to change. So, it is needed to issue configureLeverArm once for every application processor boot-up. For multiple invocations of this API client should wait for the command to finish, e.g.: via ResponseCallback received before issuing a second configureLeverArm command. Behavior is not defined if client issues a second request of configureLeverArm without waiting for the finish of the previous configureLeverArm request.

**Parameters**

in	<i>info</i>	- lever arm configuration info regarding below three types of lever arm info: a: GNSS Antenna with respect to the origin at the IMU (inertial measurement unit) for DR engine b: GNSS Antenna with respect to the origin at the IMU (inertial measurement unit) for VEPP engine c: VRP (Vehicle Reference Point) with respect to the origin (at the GNSS Antenna). Vehicle manufacturers prefer the position output to be tied to a specific point in the vehicle rather than where the antenna is placed (midpoint of the rear axle is typical).
in	<i>callback</i>	- Optional callback to get the response of configure lever arm.

**5.17.1.3.3.8 virtual telux::common::Status telux::loc::ILocationConfigurator::configureConstellations ( const SvBlackList & *list*, telux::common::ResponseCallback *callback* = *nullptr*, bool *resetToDefault* = *false* ) [pure virtual]**

This API blacklists some constellations or subset of SVs from the constellation from being used by the GNSS standard position engine (SPE). Supported constellations for this API are GLONASS, QZSS, BEIDOU, GALILEO and SBAS. For other constellations NOTSUPPORTED status will be returned. For SBAS, SVs are not used in positioning by the GNSS standard position engine (SPE) by default. Blacklisting SBAS SV only blocks SBAS data demodulation and will not disable SBAS cross-correlation detection algorithms as they are necessary for optimal GNSS standard position engine (SPE) performance. When *resetToDefault* is false then the list is expected to contain the constellations or SVs that should be blacklisted. An empty list could be specified to allow all constellations/SVs (i.e. none will be blacklisted) in determining the fix. When *resetToDefault* is set to true, the device will revert to the default list of SV/constellations to be blacklisted. For multiple invocations of this API, client should wait for the command to finish, e.g.: via ResponseCallback received before issuing a second configureConstellations command. Behavior is not defined if client issues a second request of configureConstellations without waiting for the finish of the previous configureConstellations request. This API call is not incremental and the new settings will completely overwrite the previous call.

**Parameters**

in	<i>list</i>	- specify the set of constellations and SVs that should not be used by the GNSS engine on modem. Constellations and SVs not specified in blacklistedSvList could get used by the GNSS engine on modem.
in	<i>callback</i>	- Optional callback to get the response of configure constellations.
in	<i>resetToDefault</i>	- when set to true, the device will revert to the default list of SV/constellation to be blacklisted. When set to false, list will be inspected to determine what should be blacklisted.

**5.17.1.3.3.9 virtual telux::common::Status telux::loc::ILocationConfigurator::configureSecondaryBand ( const ConstellationSet & set, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

This API configures the secondary band constellations used by the GNSS standard position engine. This API call is not incremental and the new settings will completely overwrite the previous call. The set specifies the supported constellations whose secondary band information should be disabled. The absence of a constellation in the set will result in the secondary band being enabled for that constellation. The modem has its own configuration in NV (persistent memory) about which constellation's secondary bands are allowed to be enabled. When a constellation is omitted when this API is invoked the secondary band for that constellation will only be enabled if the modem configuration allows it. If not allowed then this API would be a no-op for that constellation. Passing an empty set to this API will result in all constellations as allowed by the modem configuration to be enabled. For multiple invocations of this API, client should wait for the command to finish, e.g.: via ResponseCallback received, before issuing a second configureSecondaryBand command. Behavior is not defined if client issues a second request of configureSecondaryBand without waiting for the finish of the previous configureSecondaryBand request.

**Parameters**

in	<i>set</i>	- specifies the set of constellations whose secondary bands need to be disabled.
in	<i>callback</i>	- Optional callback to get the response of configureSecondaryBand.

**5.17.1.3.3.10 virtual telux::common::Status telux::loc::ILocationConfigurator::requestSecondaryBandConfig ( GetSecondaryBandCallback cb ) [pure virtual]**

This API retrieves the secondary band configurations for constellation used by the standard GNSS engine (SPE).

**Parameters**

in	<i>cb</i>	- callback to retrieve secondary band information about constellations.
----	-----------	---

**Returns**

Status of requestSecondaryBandConfig i.e. success or suitable status code.

**5.17.1.3.3.11 virtual telux::common::Status telux::loc::ILocationConfigurator::configureRobustLocation ( bool enable, bool enableForE911 = false, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

This API enables/disables robust location 2.0 feature and enables/disables robust location while device is on E911. When this API is enabled it reports confidence of the GNSS spoofing by the getConformityIndex() API defined in the [ILocationInfoEx](#) class, which is a measure of robustness of the underlying navigation solution. It indicates how well the various input data considered for navigation solution conform to expectations. In the presence of detected spoofed inputs, the navigation solution may take corrective actions to mitigate the spoofed inputs and improve robustness of the solution.

in	<i>enable</i>	- true to enable robust location and false to disable robust location.
in	<i>enableForE911</i>	- true to enable robust location when the device is on E911 session and false to disable on E911 session. This parameter is only valid if robust location is enabled.
in	<i>callback</i>	- Optional callback to get the response of configure robust location.

#### 5.17.1.3.3.12 virtual telux::common::Status telux::loc::ILocationConfigurator::requestRobustLocation ( GetRobustLocationCallback *cb* ) [pure virtual]

This API retrieves the robust location 2.0 settings and version info used by the GNSS standard position engine (SPE).

##### Parameters

in	<i>cb</i>	- callback to retrieve robust location information.
----	-----------	---

##### Returns

Status of requestRobustLocation i.e. success or suitable status code.

#### 5.17.1.3.3.13 virtual telux::common::Status telux::loc::ILocationConfigurator::configureMinGpsWeek ( uint16\_t *minGpsWeek*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]

This API configures the minimum GPS week used by the modem GNSS standard position engine (SPE) and shall not be called while GNSS SPE is in the middle of a session. Client needs to assure that there is no active GNSS SPE session prior to issuing this command. Client should wait for the command to finish, e.g.: via ResponseCallback received before issuing a second configureMinGpsWeek command. Behavior is not defined if client issues a second request of configureMinGpsWeek without waiting for the previous configureMinGpsWeek to finish. Additionally minimum GPS week number shall NEVER be in the future of the current GPS Week.

##### Parameters

in	<i>minGpsWeek</i>	- minimum GPS week to be used by modem GNSS engine.
in	<i>callback</i>	- Optional callback to get the response of configure minimum GPS week.

##### Returns

Status of configureMinGpsWeek i.e. success or suitable status code.

#### 5.17.1.3.3.14 virtual telux::common::Status telux::loc::ILocationConfigurator::requestMinGpsWeek ( GetMinGpsWeekCallback *cb* ) [pure virtual]

This API retrieves the minimum GPS week configuration used by the modem GNSS standard position engine (SPE). If this API is called right after configureMinGpsWeek, the returned setting may not match the

one specified in `configureMinGpsWeek`, as the setting configured via `configureMinGpsWeek` can not be applied to the GNSS standard position engine(SPE) when the engine is in middle of a session. In poor GPS signal condition, the session may take up to 255 seconds to finish. If after 255 seconds of invoking `configureMinGpsWeek`, the returned value still does not match, then the caller need to reapply the setting by invoking `configureMinGpsWeek` again.

### Parameters

<code>in</code>	<code>cb</code>	- callback to retrieve the minimum gps week.
-----------------	-----------------	--

### Returns

Status of `requestMinGpsWeek` i.e. success or suitable status code.

**5.17.1.3.3.15** `virtual telux::common::Status telux::loc::ILocationConfigurator::configureMinSVElevation ( uint8_t minSVElevation, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API configures the minimum SV elevation angle setting used by the GNSS standard position engine. Configuring minimum SV elevation setting will not cause SPE to stop tracking low elevation SVs. It only controls the list of SVs that are used in the filtered position solution, so SVs with elevation below the setting will be excluded from use in the filtered position solution. Configuring this setting to large angle will cause more SVs to get filtered out in the filtered position solution and will have negative performance impact.

This setting does not impact the SV information and SV measurement reports retrieved from APIs such as `IGnssSvInfo::getSVInfoList`, `ILocationListener::onGnssMeasurementsInfo`.

To apply the setting, the GNSS standard position engine(SPE) will require GNSS measurement engine and position engine to be turned off briefly. This may cause glitch for on-going tracking session and may have other performance impact. So, it is advised to use this API with caution and only for very limited usage scenario, e.g.: for performance test and certification process and for one-time device configuration.

Client should wait for the command to finish, e.g.: via `ResponseCallback` received, before issuing a second `configureMinElevation` command. If this API is called while the GNSS Position Engine is in the middle of a session, `ResponseCallback` will still be invoked shortly to indicate the setting has been received by the SPE engine. However the actual setting can not be applied until the current session ends, and this may take up to 255 seconds in poor GPS signal condition.

### Parameters

<code>in</code>	<code>minSVElevation</code>	- minimum SV elevation to be used by GNSS standard position engine (SPE). Valid range is [0, 90] in unit of degree.
<code>in</code>	<code>callback</code>	- Optional callback to get the response of configure minimum SV Elevation angle.

### Returns

Status of `configureMinSVElevation` i.e. success or suitable status code.

**5.17.1.3.3.16 virtual telux::common::Status telux::loc::ILocationConfigurator::requestMinSVElevation ( GetMinSVElevationCallback *cb* ) [pure virtual]**

This API retrieves the minimum SV Elevation configuration used by the modem GNSS SPE engine. If this API is invoked right after the `configureMinSVElevation`, the returned setting may not match the one specified in `configureMinSVElevation`, as the setting received via `configureMinSVElevation` might not have been applied yet as it takes time to apply the setting if the GNSS SPE engine has an on-going session. In poor GPS signal condition, the session may take up to 255 seconds to finish. If after 255 seconds of invoking `configureMinSVElevation`, the returned value still does not match, then the caller need to reapply the setting by invoking `configureMinSVElevation` again.

**Parameters**

in	<i>cb</i>	- callback to retrieve the minimum SV elevation.
----	-----------	--

**Returns**

Status of `requestMinSVElevation` i.e. success or suitable status code.

**5.17.1.3.3.17 virtual telux::common::Status telux::loc::ILocationConfigurator::deleteAidingData ( AidingData *aidingDataMask*, telux::common::ResponseCallback *callback = nullptr* ) [pure virtual]**

This API deletes specified aiding data from all position engines on the device. For example, removing ephemeris data may trigger GNSS engine to do a warm start. Invoking this API may cause noticeable delay for the position engine to produce first fix and may have other performance impact. So, this API should only be exercised with caution and only for very limited usage scenario, e.g.: for performance test and certification process.

**Parameters**

in	<i>aidingDataMask</i>	- specify the set of aiding data to be deleted from all position engines. Currently, only ephemeris deletion is supported.
in	<i>callback</i>	- Optional callback to get the response of delete aiding data.

**Returns**

Status of `deleteAidingData` i.e. success or suitable status code.

**5.17.1.3.3.18 virtual telux::common::Status telux::loc::ILocationConfigurator::configureDR ( const DREngineConfiguration & *config*, telux::common::ResponseCallback *callback = nullptr* ) [pure virtual]**

This API configures various parameters for dead reckoning position engine. Clients should wait for the command to finish e.g.: via `ResponseCallback` to be received before issuing a second `configureDR` command. Behavior is not defined if client issues a second request of `configureDR` without waiting for the completion of the previous `configureDR` request.

in	<i>config</i>	- specify dead reckoning engine configuration.
in	<i>callback</i>	- Optional callback to get the response of configureDR.

### Returns

Status of configureDR i.e. success or suitable status code.

**5.17.1.3.3.19 virtual telux::common::Status telux::loc::ILocationConfigurator::configureEngineState ( const EngineType *engineType*, const LocationEngineRunState *engineState*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

This API is used to instruct the specified engine to be in the suspended/running state. When the engine is placed in suspended state, the engine will stop. If there is an on-going session, engine will no longer produce fixes. In the suspended state, calling API to delete aiding data from the paused engine may not have effect. Request to delete Aiding data shall be issued after engine resume.

Currently, only DR engine will support this request. The request to suspend/running DR engine can be made with or without an on-going session. With DR engine, on resume, GNSS position & heading re-acquisition may be needed for DR to engage.

### Parameters

in	<i>engineType</i>	- the engine that is instructed to change its run state.
in	<i>engineState</i>	- the new engine run state that the engine is instructed to be in.
in	<i>callback</i>	- Optional callback to get the response of configureEngineState.

### Returns

Status of configureEngineState i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.20 virtual telux::common::Status telux::loc::ILocationConfigurator::provideConsentForTerrestrialPositioning ( bool *userConsent*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

Clients can request Terrestrial Positioning using [ILocationManager::getTerrestrialPosition](#). Terrestrial Positioning requires sending device data to the cloud to get the position. This functionality requires user consent. This API needs to be invoked to provide the user consent.

The consent will remain effective across power cycles, until this API is called with a different value.

### Parameters

in	<i>userConsent</i>	- true indicates user consents to sending device data to cloud, false indicates user does not consent.
----	--------------------	--

in	<i>callback</i>	- Optional callback to get the response of <code>provideConsentForTerrestrialPositioning</code> .
----	-----------------	---

**Returns**

Status of `provideConsentForTerrestrialPositioning` i.e. success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.21** `virtual telux::common::Status telux::loc::ILocationConfigurator::configureNmeaTypes ( const NmeaSentenceConfig nmeaType, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API is used to configure the NMEA sentence types that clients will receive via [ILocationManager::startDetailedReports](#) or [ILocationManager::startDetailedEngineReports](#). Without prior invocation to this API, all NMEA sentences supported in the system will get generated and delivered to all the clients that register to receive NMEA sentences. The NMEA sentence type configuration is common across all clients and updating it will affect all clients. This API call is not incremental and the new NMEA sentence types will completely overwrite the previous call to this API.

**Parameters**

in	<i>nmeaType</i>	- specify the set of NMEA sentences
in	<i>callback</i>	- Optional callback to get the response of <code>configureNmeaTypes</code> .

**Returns**

Status of `configureNmeaTypes` i.e. success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.22** `virtual telux::common::Status telux::loc::ILocationConfigurator::configureNmea ( const NmeaConfig configParams, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API is used to configure the NMEA sentences that the clients will receive via [ILocationManager::startDetailedReports](#) or [ILocationManager::startDetailedEngineReports](#). Without prior invocation to this API, all NMEA sentences supported in the system will get generated and delivered to all the clients that register to receive NMEA sentences. The NMEA sentence type configuration is common across all clients and updating it will affect all clients.

Please note that for the NMEA datum type request to be successful, the nmea provider configuration in the GPS configuration file should be set to application processor.

This API call is not incremental and the new NMEA configuration will completely overwrite the previous call to this API.

### Parameters

in	<i>configParams</i>	- Configuration Parameters for Nmea on the device.
in	<i>callback</i>	- Optional callback to get the response of configureNmea.

### Returns

Status of configureNmea i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.23 virtual telux::common::Status telux::loc::LocationConfigurator::configure↔  
EngineIntegrityRisk ( const EngineType *engineType*, uint32\_t *integrityRisk*,  
telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]**

This API is used to instruct the specified engine to use the provided integrity risk level for protection level calculation in position report. This API can be called when a position session is in progress. Prior to calling this API for a particular engine, the engine shall not calculate the protection levels and shall not include the protection levels in its position report. The implementation might not support protection levels across all engines. For engines that don't support it, ResponseCallback will get invoked with ErrorCode::NOT\_SUPPORTED.

### Parameters

in	<i>engineType</i>	- the engine that is instructed to use the specified integrity risk level for protection level calculation.
in	<i>integrityRisk</i>	- the integrity risk level used for calculating protection level. The integrity risk is defined as a probability per epoch, in unit of 2.5e-10. The valid range for actual integrity is [2.5e-10, 1-2.5e-10]), this corresponds to range of [1,4e9-1] of this parameter.
in	<i>callback</i>	- Optional callback to get the response of configureEngineIntegrityRisk.

### Returns

Status of configureEngineIntegrityRisk i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.24 virtual telux::common::Status telux::loc::ILocationConfigurator::configureXtraParams ( bool *enable*, const XtraConfig *configParams*, telux::common::ResponseCallback *callback = nullptr* ) [pure virtual]**

This API is used to enable/disable the XTRA (Predicted GNSS Satellite Orbit Data) feature on device. If XTRA feature is to be enabled, this API is also used to configure the various XTRA settings in device.

Clients need to note the below-

1. Wait for the ongoing request to finish prior to the next invocation else the behavior is undefined.
2. The API is non-incremental i.e, the second call will overwrite the first call. Also the configured XTRA params will be persistent.

#### Parameters

in	<i>enable</i>	- Enable XTRA Feature on the device. False would disable both the XTRA Assistance Data and NTP Time Download.
in	<i>configParams</i>	- Configuration Parameters for XTRA on the device.
in	<i>callback</i>	- Optional callback stating the response errorcode.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.25 virtual telux::common::Status telux::loc::ILocationConfigurator::requestXtraStatus ( GetXtraStatusCallback *callback* ) [pure virtual]**

This API is used to query xtra feature setting and xtra assistance data status used by the GNSS standard position engine (SPE). If XTRA\_DATA\_STATUS\_UNKNOWN is returned but XTRA feature is enabled, the client shall wait a few seconds before calling this API again.

#### Parameters

in	<i>callback</i>	- Callback to get the Xtra data status information.
----	-----------------	---

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.3.3.26 virtual telux::common::Status telux::loc::ILocationConfigurator::registerListener ( LocConfigIndications *indicationList*, std::weak\_ptr< ILocationConfigListener > *listener* ) [pure virtual]**

This API is used to register a configuration listener for getting specific indications/updates.

in	<i>indicationList</i>	- List of indications client wants to register under <a href="#">telux::loc::LocConfigIndicationsType</a> .
in	<i>listener</i>	- Pointer of <a href="#">ILocationConfigListener</a> object.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.17.1.3.3.27 virtual telux::common::Status telux::loc::ILocationConfigurator::deRegisterListener ( LocConfigIndications *indicationList*, std::weak\_ptr< ILocationConfigListener > *listener* ) [pure virtual]

This API is used to deregister a configuration listener from specific indications/updates.

**Parameters**

in	<i>indicationList</i>	- List of indications client wants to deregister from under <a href="#">telux::loc::LocConfigIndicationsType</a> .
in	<i>listener</i>	- Pointer of <a href="#">ILocationConfigListener</a> object.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.17.1.4 struct telux::loc::GnssKinematicsData

Specifies kinematics related information related to device body frame parameters.

**Data fields**

Type	Field	Description
<a href="#">Kinematic↔ DataValidity</a>	bodyFrame↔ DataMask	Contains Body frame data valid bits.
float	longAccel	Forward Acceleration in body frame (meters/second <sup>2</sup> )
float	latAccel	Sideward Acceleration in body frame (meters/second <sup>2</sup> )
float	vertAccel	Vertical Acceleration in body frame (meters/second <sup>2</sup> )
float	yawRate	Heading Rate (Radians/second)
float	pitch	Body pitch (Radians)
float	longAccelUnc	Uncertainty of Forward Acceleration in body frame (meters/second <sup>2</sup> ) Uncertainty is defined with 68% confidence level.
float	latAccelUnc	Uncertainty of Side-ward Acceleration in body frame (meters/second <sup>2</sup> ) Uncertainty is defined with 68% confidence level.
float	vertAccelUnc	Uncertainty of Vertical Acceleration in body frame (meters/second <sup>2</sup> ) Uncertainty is defined with 68% confidence level.
float	yawRateUnc	Uncertainty of Heading Rate (Radians/second) Uncertainty is defined with 68% confidence level.

Type	Field	Description
float	pitchUnc	Uncertainty of Body pitch (Radians) Uncertainty is defined with 68% confidence level.
float	pitchRate	Body pitch rate, in unit of radians/second.
float	pitchRateUnc	Uncertainty of pitch rate, in unit of radians/second. Uncertainty is defined with 68% confidence level.
float	roll	Roll of body frame, clockwise is positive, in unit of radian.
float	rollUnc	Uncertainty of roll, in unit of radian. Uncertainty is defined with 68% confidence level.
float	rollRate	Roll rate of body frame, clockwise is positive, in unit of radian/second.
float	rollRateUnc	Uncertainty of roll rate, in unit of radian/second. Uncertainty is defined with 68% confidence level.
float	yaw	Yaw of body frame, clockwise is positive, in unit of radian.
float	yawUnc	Uncertainty of yaw, in unit of radian. Uncertainty is defined with 68% confidence level.

### 5.17.1.5 struct telux::loc::LLAInfo

The location info is calculated according to the vehicle's GNSS antenna where as Vehicle Reference Point (VRP) refers to a point on the vehicle where the display of the car sits. The VRP based info is calculated by adding that extra difference between GNSS antenna and the VRP on the top where the location info is received. The VRP parameters can be configured through [ILocationConfigurator::configureLeverArm](#). [LLAInfo](#) specifies latitude, longitude and altitude info of location for VRP-based.

#### Data fields

Type	Field	Description
double	latitude	Latitude, in unit of degrees, range [-90.0, 90.0].
double	longitude	Longitude, in unit of degrees, range [-180.0, 180.0].
float	altitude	Altitude above the WGS 84 reference ellipsoid, in unit of meters.

### 5.17.1.6 struct telux::loc::TimeInfo

Specify non-Glonass Gnss system time info.

#### Data fields

Type	Field	Description
<a href="#">GnssTime</a> ↔ <a href="#">Validity</a>	validityMask	Validity mask for below fields
uint16_t	systemWeek	Extended week number at reference tick. Unit: Week. Set to 65535 if week number is unknown. For GPS: Calculated from midnight, Jan. 6, 1980. OTA decoded 10 bit GPS week is extended to map between: [NV6264 to (NV6264 + 1023)]. For BDS: Calculated from 00:00:00 on January 1, 2006 of Coordinated Universal Time (UTC). For GAL: Calculated from 00:00 UT on Sunday August 22, 1999 (midnight between August 21 and August 22).

Type	Field	Description
uint32_t	systemMsec	Time in to the current week at reference tick. Unit: Millisecond. Range: 0 to 604799999.
float	systemClk↔ TimeBias	System clock time bias Units: Millisecond Note: System time (TOW Millisecond) = systemMsec - systemClkTimeBias.
float	systemClk↔ TimeUncMs	Single sided maximum time bias uncertainty Units: Millisecond
uint32_t	refFCount	FCount (free running HW timer) value. Don't use for relative time purpose due to possible discontinuities. Unit: Millisecond
uint32_t	numClock↔ Resets	Number of clock resets/discontinuities detected, affecting the local hardware counter value.

### 5.17.1.7 struct telux::loc::GlonassTimeInfo

Specifies Glonass system time info.

#### Data fields

Type	Field	Description
uint16_t	gloDays	GLONASS day number in four years. Refer to GLONASS ICD. Applicable only for GLONASS and shall be ignored for other constellations. If unknown shall be set to 65535
<a href="#">TimeValidity</a>	validityMask	Validity mask for <a href="#">GlonassTimeInfo</a> fields
uint32_t	gloMsec	GLONASS time of day in Millisecond. Refer to GLONASS ICD. Units: Millisecond.
float	gloClkTime↔ Bias	GLONASS clock time bias. Units: Millisecond Note: GLO time (TOD Millisecond) = gloMsec - gloClkTimeBias. Check for gloClkTimeUncMs before use.
float	gloClkTime↔ UncMs	Single sided maximum time bias uncertainty Units: Millisecond
uint32_t	refFCount	FCount (free running HW timer) value. Don't use for relative time purpose due to possible discontinuities. Unit: Millisecond
uint32_t	numClock↔ Resets	Number of clock resets/discontinuities detected, affecting the local hardware counter value.
uint8_t	gloFourYear	GLONASS four year number from 1996. Refer to GLONASS ICD. Applicable only for GLONASS and shall be ignored for other constellations.

### 5.17.1.8 union telux::loc::SystemTimeInfo

Union to hold GNSS system time from different constellations in [SystemTime](#).

#### Data fields

Type	Field	Description
<a href="#">TimeInfo</a>	gps	System time info from GPS constellation.
<a href="#">TimeInfo</a>	gal	System time info from GALILEO constellation.
<a href="#">TimeInfo</a>	bds	System time info from BEIDOU constellation.

Type	Field	Description
<a href="#">TimeInfo</a>	qzss	System time info from QZSS constellation.
<a href="#">GlonassTime↔Info</a>	glo	System time info from GLONASS constellation.
<a href="#">TimeInfo</a>	navic	System time info from NAVIC constellation.

### 5.17.1.9 struct telux::loc::SystemTime

GNSS system time in [ILocationInfoEx](#).

#### Data fields

Type	Field	Description
<a href="#">GnssSystem</a>	gnssSystem↔TimeSrc	Specify the source constellation for GNSS system time.
<a href="#">SystemTime↔Info</a>	time	Specify the GNSS system time corresponding to the source.

### 5.17.1.10 struct telux::loc::GnssMeasurementInfo

Specify the satellite vehicle measurements that are used to calculate location in [ILocationInfoEx](#).

#### Data fields

Type	Field	Description
<a href="#">GnssSignal</a>	gnssSignalType	GnssSignalType mask
<a href="#">GnssSystem</a>	gnss↔Constellation	Specifies GNSS Constellation Type
uint16_t	gnssSvId	GNSS SV ID. For GPS: 1 to 32. For GLONASS: [65, 96] or [97, 110]. [65, 96] if orbital slot number(OSN) is known. [97, 110] as frequency channel number(FCN) [-7, 6] plus 104. i.e. encode FCN (-7) as 97, FCN (0) as 104, FCN (6) as 110. For SBAS: 120 to 158 and 183 to 191. For QZSS: 193 to 197. For BDS: 201 to 263. For GAL: 301 to 336. For NAVIC: 401 to 414.

### 5.17.1.11 struct telux::loc::SvUsedInPosition

Specify the set of SVs that are used to calculate location in [ILocationInfoEx](#).

#### Data fields

Type	Field	Description
uint64_t	gps	Specify the set of SVs from GPS constellation that are used to compute the position. Bit 0 to Bit 31 corresponds to GPS SV id 1 to 32.
uint64_t	glo	Specify the set of SVs from GLONASS constellation that are used to compute the position. Bit 0 to Bit 31 corresponds to GLO SV id 65 to 96.

Type	Field	Description
uint64_t	gal	Specify the set of SVs from GALILEO constellation that are used to compute the position. Bit 0 to Bit 35 corresponds to GAL SV id 301 to 336.
uint64_t	bds	Specify the set of SVs from BEIDOU constellation that are used to compute the position. Bit 0 to Bit 62 corresponds to BDS SV id 201 to 263.
uint64_t	qzss	Specify the set of SVs from QZSS constellation that are used to compute the position. Bit 0 to Bit 4 corresponds to QZSS SV id 193 to 197.
uint64_t	navic	Specify the set of SVs from NAVIC constellation that are used to compute the position. Bit 0 to Bit 13 corresponds to NAVIC SV id 401 to 414.

### 5.17.1.12 struct telux::loc::GnssData

Specify the additional GNSS data that can be provided during a tracking session, currently jammer and automatic gain control data are available.

#### Data fields

Type	Field	Description
GnssData↔ Validity	gnssData↔ Mask[Gnss↔ DataSignal↔ Types::GNSS↔ _DATA_MA↔ X_NUMBER↔ _OF_SIGNA↔ L_TYPES]	bitwise OR of GnssDataValidityType
double	jammer↔ Ind[GnssData↔ SignalTypes::↔ GNSS_DAT↔ A_MAX_NU↔ MBER_OF_↔ SIGNAL_TY↔ PES]	Jammer Indication for each signal type. Each index represents the signal type in GnssDataSignalTypes.
double	agc[Gnss↔ DataSignal↔ Types::GNSS↔ _DATA_MA↔ X_NUMBER↔ _OF_SIGNA↔ L_TYPES]	Automatic gain control for each signal type. Each index corresponds to the signal type in GnssDataSignalTypes.

### 5.17.1.13 struct telux::loc::SvBlackListInfo

Specify parameters related to enable/disable SVs

#### Data fields

Type	Field	Description
<a href="#">Gnss↔ Constellation↔ Type</a>	constellation	constellation for the sv
uint32_t	svId	sv id for the constellation: 0 means blacklist for all SVIDs of a given constellation type GLONASS SV id range: 65 to 96 QZSS SV id range: 193 to 197 BDS SV id range: 201 to 237 GAL SV id range: 301 to 336 SBAS SV id range: 120 to 158 and 183 to 191

### 5.17.1.14 struct telux::loc::LeverArmParams

Specify parameters related to lever arm

#### Data fields

Type	Field	Description
float	forwardOffset	Offset along the vehicle forward axis, in unit of meters
float	sidewaysOffset	Offset along the vehicle starboard axis, in unit of meters
float	upOffset	Offset along the vehicle up axis, in unit of meters

### 5.17.1.15 struct telux::loc::GnssMeasurementsData

Specify the signal measurement information such as satellite vehicle pseudo range, satellite vehicle time, carrier phase measurement etc. from GNSS positioning engine.

#### Data fields

Type	Field	Description
<a href="#">Gnss↔ Measurements↔ DataValidity</a>	valid	Bitwise OR of GnssMeasurementsDataValidityType to specify the valid fields in <a href="#">GnssMeasurementsData</a> .
int16_t	svId	Specify satellite vehicle ID number.
<a href="#">Gnss↔ Constellation↔ Type</a>	svType	SV constellation type.
double	timeOffsetNs	Time offset when the measurement was taken, in unit of nanoseconds.
<a href="#">Gnss↔ Measurements↔ StateValidity</a>	stateMask	Bitwise OR of GnssMeasurementsStateValidityType to specify the GNSS measurement state.
int64_t	receivedSv↔ TimeNs	Received GNSS time of the week in nanoseconds when the measurement was taken. Total time is: receivedSvTimeNs+receivedSvTimeSubNs.

Type	Field	Description
float	receivedSv↔ TimeSubNs	Sub nanoseconds portion of the received GNSS time of the week when the measurement was taken. Total time is: receivedSvTimeNs+receivedSvTimeSubNs.
int64_t	receivedSv↔ Time↔ UncertaintyNs	Satellite time. All SV times in the current measurement block are already propagated to a common reference time epoch, in unit of nano seconds.
double	carrierTo↔ NoiseDbHz	Signal strength, carrier to noise ratio, in unit of dB-Hz.
double	pseudorange↔ RateMps	Uncorrected pseudorange rate, in unit of metres/second.
double	pseudorange↔ Rate↔ Uncertainty↔ Mps	Uncorrected pseudorange rate uncertainty, in unit of meters/second.
Gnss↔ Measurements↔ AdrState↔ Validity	adrStateMask	Bitwise OR of GnssMeasurementsAdrStateValidityType.
double	adrMeters	Accumulated delta range, in unit of meters.
double	adr↔ Uncertainty↔ Meters	Accumulated delta range uncertainty, in unit of meters.
float	carrier↔ FrequencyHz	Carrier frequency of the tracked signal, in unit of Hertz.
int64_t	carrierCycles	The number of full carrier cycles between the receiver and the satellite.
double	carrierPhase	The RF carrier phase that the receiver has detected.
double	carrierPhase↔ Uncertainty	The RF carrier phase uncertainty.
Gnss↔ Measurements↔ Multipath↔ Indicator	multipath↔ Indicator	Multipath indicator, could be unknown, present or not present.
double	signalTo↔ NoiseRatioDb	Signal to noise ratio, in unit of dB.
double	agcLevelDb	Automatic gain control level, in unit of dB.
GnssSignal	gnssSignalType	GnssSignalType mask
double	baseband↔ CarrierToNoise	Carrier-to-noise ratio of the signal measured at baseband, in unit of dB-Hz.
double	fullInter↔ SignalBias	The full inter-signal bias (ISB) in nanoseconds. This value is the sum of the estimated receiver-side and the space-segment-side inter-system bias, inter-frequency bias and inter-code bias.
double	fullInter↔ SignalBias↔ Uncertainty	Uncertainty associated with the full inter-signal bias in nanoseconds.

### 5.17.1.16 struct telux::loc::GnssMeasurementsClock

Specify GNSS measurements clock. The main equation describing the relationship between various components is:  $utcTimeNs = timeNs - (fullBiasNs + biasNs) - leapSecond * 1,000,000,000$

#### Data fields

Type	Field	Description
<a href="#">Gnss↔Measurements↔ClockValidity</a>	valid	Bitwise OR of GnssMeasurementsClockValidityType.
int16_t	leapSecond	Leap second, in unit of seconds.
int64_t	timeNs	Time, monotonically increasing as long as the power is on, in unit of nanoseconds.
double	time↔UncertaintyNs	Time uncertainty (one sigma), in unit of nanoseconds.
int64_t	fullBiasNs	Full bias, in uint of nanoseconds.
double	biasNs	Sub-nanoseconds bias, in unit of nonoseconds.
double	bias↔UncertaintyNs	Bias uncertainty (one sigma), in unit of nanoseconds.
double	driftNspS	Clock drift, in unit of nanoseconds/second.
double	drift↔Uncertainty↔NspS	Clock drift uncertainty (one sigma), in unit of nanoseconds/second.
uint32_t	hwClock↔Discontinuity↔Count	HW clock discontinuity count - incremented for each discontinuity in HW clock.

### 5.17.1.17 struct telux::loc::GnssMeasurements

Specify GNSS measurements clock and data. [GnssMeasurementInfo](#) is used to convey the satellite vehicle info whose measurements are actually used to generate the current position report. While [GnssMeasurements](#) contains the satellite measurements that device observed during tracking session, regardless the measurement is used or not used to compute the fix. Furthermore [GnssMeasurements](#) contains much richer set of information which can enable other third party engines to utilize the measurements and compute the position by itself.

#### Data fields

Type	Field	Description
<a href="#">Gnss↔Measurements↔Clock</a>	clock	GNSS measurements clock info.
vector< <a href="#">Gnss↔Measurements↔Data</a> >	measurements	GNSS measurements data.
bool	isNHz	Indicates the frequency for GNSS measurements generated at NHz or not.

### 5.17.1.18 struct telux::loc::LeapSecondChangeInfo

Specify leap second change event info.

#### Data fields

Type	Field	Description
<a href="#">TimeInfo</a>	timeInfo	GPS timestamp that corresponds to the last known leap second change event. The info can be available on two scenario: 1: This leap second change event has been scheduled and yet to happen 2: This leap second change event has already happened and next leap second change event has not yet been scheduled.
uint8_t	leapSeconds↔ BeforeChange	Number of leap seconds prior to the leap second change event that corresponds to the timestamp at timeInfo.
uint8_t	leapSeconds↔ AfterChange	Number of leap seconds after the leap second change event that corresponds to the timestamp at timeInfo.

### 5.17.1.19 struct telux::loc::LeapSecondInfo

Specify leap second info, including current leap second and leap second change event info if available.

#### Data fields

Type	Field	Description
<a href="#">LeapSecond↔ InfoValidity</a>	valid	Validity of <a href="#">LeapSecondInfo</a> fields.
uint8_t	current	Current leap seconds, in unit of seconds. This info will only be available only if the leap second change info is not available.
<a href="#">LeapSecond↔ ChangeInfo</a>	info	Leap second change event info. The info can be available on two scenario: 1: this leap second change event has been scheduled and yet to happen 2: this leap second change event has already happened and next leap second change event has not yet been scheduled. If leap second change info is available, to figure out the current leap second info, compare current gps time with <a href="#">LeapSecondChangeInfo::timeInfo</a> to know whether to choose leapSecondBefore or leapSecondAfter as current leap second.

### 5.17.1.20 struct telux::loc::LocationSystemInfo

Specify location system information.

#### Data fields

Type	Field	Description
<a href="#">Location↔ SystemInfo↔ Validity</a>	valid	validity of <a href="#">LocationSystemInfo::info</a>
<a href="#">LeapSecond↔ Info</a>	info	Current leap second and leap second info.

### 5.17.1.21 struct telux::loc::GnssEnergyConsumedInfo

Specify the info regarding energy consumed by GNSS engine.

#### Data fields

Type	Field	Description
<a href="#">GnssEnergyConsumedInfoValidity</a>	valid	Bitwise OR of GnssEnergyConsumedInfoValidityType to specify the valid fields in <a href="#">GnssEnergyConsumedInfo</a> .
uint64_t	energySinceFirstBoot	Energy consumed by the modem GNSS engine since device first ever bootup, in unit of 0.1 milli watt seconds. For an invalid reading, INVALID_ENERGY_CONSUMED is returned.

### 5.17.1.22 struct telux::loc::NmeaConfig

Specify the Nmea Config Parameters

#### Data fields

Type	Field	Description
<a href="#">NmeaSentenceConfig</a>	sentenceConfig	Specify the sentences to be configured.
<a href="#">GeodeticDatumType</a>	datumType	Specify the datum type to be configured.

### 5.17.1.23 struct telux::loc::RobustLocationVersion

Specify the versioning info of robust location module for the GNSS standard position engine (SPE).

#### Data fields

Type	Field	Description
uint8_t	major	Major version number.
uint16_t	minor	Minor version number.

### 5.17.1.24 struct telux::loc::RobustLocationConfiguration

Specify the robust location configuration used by the GNSS standard position engine (SPE)

#### Data fields

Type	Field	Description
<a href="#">RobustLocationConfig</a>	validMask	Validity mask
bool	enabled	Specify whether robust location feature is enabled or not.
bool	enabledForE911	Specify whether robust location feature is enabled or not when device is on E911 call.

Type	Field	Description
<a href="#">Robust↔ Location↔ Version</a>	version	Specify the version info of robust location module used by the GNSS standard position engine (SPE).

### 5.17.1.25 struct telux::loc::BodyToSensorMountParams

Specify vehicle body-to-Sensor mount parameters for use by dead reckoning positioning engine.

#### Data fields

Type	Field	Description
float	rollOffset	The misalignment of the sensor board along the horizontal plane of the vehicle chassis measured looking from the vehicle to forward direction. In unit of degrees. Range: [-180.0, 180.0].
float	yawOffset	The misalignment along the horizontal plane of the vehicle chassis measured looking from the vehicle to the right side. Positive pitch indicates vehicle is inclined such that forward wheels are at higher elevation than rear wheels. In unit of degrees. Range: [-180.0, 180.0].
float	pitchOffset	The angle between the vehicle forward direction and the sensor axis as seen from the top of the vehicle, and measured in counterclockwise direction. In unit of degrees. Range: [-180.0, 180.0].
float	offsetUnc	Single uncertainty number that may be the largest of the uncertainties for roll offset, pitch offset and yaw offset. In unit of degrees. Range: [-180.0, 180.0].

### 5.17.1.26 struct telux::loc::DREngineConfiguration

Specify the dead reckoning engine configuration parameters.

#### Data fields

Type	Field	Description
<a href="#">DRConfig↔ Validity</a>	validMask	Specify the valid fields.
<a href="#">BodyTo↔ SensorMount↔ Params</a>	mountParam	Body to sensor mount parameters used by dead reckoning positioning engine.
float	speedFactor	Vehicle Speed Scale Factor configuration input for the dead reckoning positioning engine. The multiplicative scale factor is applied to the received Vehicle Speed value (in meter/second) to obtain the true Vehicle Speed. Range is [0.9 to 1.1]. Note: The scale factor is specific to a given vehicle make & model.
float	speedFactor↔ Unc	Vehicle Speed Scale Factor Uncertainty (68% confidence) configuration input for the dead reckoning positioning engine. Range is [0.0 to 0.1]. Note: The scale factor uncertainty is specific to a given vehicle make & model.

Type	Field	Description
float	gyroFactor	Gyroscope Scale Factor configuration input for the dead reckoning positioning engine. The multiplicative scale factor is applied to received gyroscope value to obtain the true value. Range is [0.9 to 1.1]. Note: The scale factor is specific to the Gyroscope sensor and typically derived from either sensor data-sheet or from actual calibration.
float	gyroFactorUnc	Gyroscope Scale Factor uncertainty (68% confidence) configuration input for the dead reckoning positioning engine. Range is [0.0 to 0.1]. Note: The scale factor uncertainty is specific to the Gyroscope sensor and typically derived from either sensor data-sheet or from actual calibration.

### 5.17.1.27 struct telux::loc::XtraConfig

Xtra feature configuration parameters

#### Data fields

Type	Field	Description
uint32_t	download↔ IntervalMinute	Number of minutes between periodic, consecutive successful XTRA assistance data downloads. If 0 is specified, modem default download for XTRA assistance data will be performed.
uint32_t	download↔ TimeoutSec	Connection timeout when connecting backend for both xtra assistance data download and NTP time download. If 0 is specified, the download timeout value will use device default values.
uint32_t	download↔ RetryInterval↔ Minute	Interval to wait before retrying for xtra assistance data's download in case of failure. If 0 is specified, XTRA download retry will follow device default behavior and downloadRetryAttempts will also use device default value.
uint32_t	download↔ RetryAttempts	Total number of allowed retry attempts for assistance data's download in case of failure. If 0 is specified, XTRA download retry will follow device default behavior and downloadRetryIntervalMinute will also use device default value.
string	caPath	Path to the certificate authority (CA) repository that needs to be used for XTRA assistance data download. If empty string is specified, device default CA repository will be used.

Type	Field	Description
vector< string >	serverURLs	URLs from which XTRA assistance data will be fetched. At least one and up to three URLs need to be configured when this API is used.  The URLs, if provided, shall include the port number to be used for download.  Valid xtra server URLs should start with "https://".  Example of a valid URL : <a href="https://path.exampleserver.net:443">https://path.exampleserver.net:443</a>
vector< string >	ntpServerURLs	URLs for NTP server to fetch current time.  If no NTP server URL is provided, then device will use the default NTP server.  The URLs, if provided, shall include the port number to be used for download.  Example of a valid ntp server URL is: ntp.exampleserver.com:123.
bool	isIntegrity↔ Download↔ Enabled	Enable or disable XTRA integrity download.  true: enable XTRA integrity download. false: disable XTRA integrity download.
uint32_t	integrity↔ Download↔ IntervalMinute	Download interval for xtra integrity, only applicable if XTRA integrity download is enabled.  If 0 is specified, the download timeout value will use device default value.
<a href="#">DebugLog↔ Level</a>	daemon↔ DebugLog↔ Level	Level of debug log messages that will be logged.

### 5.17.1.28 struct telux::loc::XtraStatus

Specify Xtra assistant data's current status, validity and whether it is enabled.

#### Data fields

Type	Field	Description
bool	featureEnabled	XTRA assistance data and NTP time download is enabled or disabled.
<a href="#">XtraDataStatus</a>	xtraDataStatus	XTRA assistance data status. If XTRA assistance data download is not enabled, this field will be set to XTRA_DATA_STATUS_UNKNOWN.
uint32_t	xtraValidFor↔ Hours	Number of hours that xtra assistance data will remain valid.  This field will be valid when xtraDataStatus is set to XTRA_DATA_STATUS_VALID. For all other XtraDataStatus, this field will be set to 0.

### 5.17.1.29 class telux::loc::ILocationInfoBase

[ILocationInfoBase](#) provides interface to get basic position related information like latitude, longitude, altitude, timestamp.

#### Public member functions

- virtual [LocationInfoValidity](#) `getLocationInfoValidity ()=0`
- virtual [LocationTechnology](#) `getTechMask ()=0`
- virtual float `getSpeed ()=0`
- virtual double `getLatitude ()=0`
- virtual double `getLongitude ()=0`
- virtual double `getAltitude ()=0`
- virtual float `getHeading ()=0`
- virtual float `getHorizontalUncertainty ()=0`
- virtual float `getVerticalUncertainty ()=0`
- virtual uint64\_t `getTimeStamp ()=0`
- virtual float `getSpeedUncertainty ()=0`
- virtual float `getHeadingUncertainty ()=0`
- virtual uint64\_t `getElapsedRealTime ()=0`
- virtual uint64\_t `getElapsedRealTimeUncertainty ()=0`

#### 5.17.1.29.1 Member Function Documentation

##### 5.17.1.29.1.1 virtual LocationInfoValidity telux::loc::ILocationInfoBase::getLocationInfoValidity ( ) [pure virtual]

Retrieves the validity of the Location basic Info.

#### Returns

Location basic validity mask.

##### 5.17.1.29.1.2 virtual LocationTechnology telux::loc::ILocationInfoBase::getTechMask ( ) [pure virtual]

Retrieves technology used in computing this fix.

#### Returns

Location technology mask.

**5.17.1.29.1.3 virtual float telux::loc::ILocationInfoBase::getSpeed ( ) [pure virtual]**

Retrieves Speed.

**Returns**

speed in meters per second.

**5.17.1.29.1.4 virtual double telux::loc::ILocationInfoBase::getLatitude ( ) [pure virtual]**

Retrieves latitude. Positive and negative values indicate northern and southern latitude respectively

- Units: Degrees
- Range: -90.0 to 90.0

**Returns**

Latitude if available else returns NaN.

**5.17.1.29.1.5 virtual double telux::loc::ILocationInfoBase::getLongitude ( ) [pure virtual]**

Retrieves longitude. Positive and negative values indicate eastern and western longitude respectively

- Units: Degrees
- Range: -180.0 to 180.0

**Returns**

Longitude if available else returns NaN.

**5.17.1.29.1.6 virtual double telux::loc::ILocationInfoBase::getAltitude ( ) [pure virtual]**

Retrieves altitude above the WGS 84 reference ellipsoid.

- Units: Meters

**Returns**

Altitude if available else returns NaN.

**5.17.1.29.1.7 virtual float telux::loc::ILocationInfoBase::getHeading ( ) [pure virtual]**

Retrieves heading/bearing.

- Units: Degrees
- Range: 0 to 359.999

**Returns**

Heading if available else returns NaN.

**5.17.1.29.1.8 virtual float telux::loc::ILocationInfoBase::getHorizontalUncertainty ( ) [pure virtual]**

Retrieves the horizontal uncertainty.

- Units: Meters Uncertainty is defined with 68% confidence level.

**Returns**

Horizontal uncertainty.

**5.17.1.29.1.9 virtual float telux::loc::ILocationInfoBase::getVerticalUncertainty ( ) [pure virtual]**

Retrieves the vertical uncertainty.

- Units: Meters Uncertainty is defined with 68% confidence level.

**Returns**

Vertical uncertainty if available else returns NaN.

**5.17.1.29.1.10 virtual uint64\_t telux::loc::ILocationInfoBase::getTimeStamp ( ) [pure virtual]**

Retrieves UTC timeInfo for the location fix.

- Units: Milliseconds since Jan 1, 1970

**Returns**

TimeStamp in milliseconds if available else returns UNKNOWN\_TIMESTAMP which is zero(as UTC timeStamp has elapsed since January 1, 1970, it cannot be 0)

**5.17.1.29.1.11 virtual float telux::loc::ILocationInfoBase::getSpeedUncertainty ( ) [pure virtual]**

Retrieves 3-D speed uncertainty/accuracy.

- Units: Meters per Second Uncertainty is defined with 68% confidence level.

**Returns**

Speed uncertainty if available else returns NaN.

**5.17.1.29.1.12 virtual float telux::loc::ILocationInfoBase::getHeadingUncertainty ( ) [pure virtual]**

Retrieves heading uncertainty.

- Units: Degrees
- Range: 0 to 359.999 Uncertainty is defined with 68% confidence level.

**Returns**

Heading uncertainty if available else returns NaN.

**5.17.1.29.1.13 virtual uint64\_t telux::loc::ILocationInfoBase::getElapsedRealTime ( ) [pure virtual]**

Boot timestamp corresponding to the UTC timestamp for Location fix.

- Units: Nano-second

**Returns**

elapsed real time.

**5.17.1.29.1.14 virtual uint64\_t telux::loc::ILocationInfoBase::getElapsedRealTimeUncertainty ( ) [pure virtual]**

Retrieves elapsed real time uncertainty.

- Units: Nano-second

**Returns**

elapsed real time uncertainty.

**5.17.1.30 class telux::loc::ILocationInfoEx**

[ILocationInfoEx](#) provides interface to get richer position related information like latitude, longitude, altitude and other information like time stamp, session status, dop, reliabilities, uncertainties etc.

**Public member functions**

- virtual [LocationInfoExValidity](#) getLocationInfoExValidity ()=0

### 5.17.1.30.1 Member Function Documentation

#### 5.17.1.30.1.1 virtual [LocationInfoExValidity](#) `telux::loc::ILocationInfoEx::getLocationInfoExValidity ( )` [pure virtual]

Retrieves the validity of the location info ex. It provides the validity of various information like dop, reliabilities, uncertainties etc.

#### Returns

Location ex validity mask

#### 5.17.1.30.1.2 virtual float `telux::loc::ILocationInfoEx::getAltitudeMeanSeaLevel ( )` [pure virtual]

Retrieves the altitude with respect to mean sea level.

- Units: Meters

#### Returns

Altitude with respect to mean sea level if available else returns NaN.

#### 5.17.1.30.1.3 virtual float `telux::loc::ILocationInfoEx::getPositionDop ( )` [pure virtual]

Retrieves position dilution of precision.

#### Returns

Position dilution of precision if available else returns NaN. Range: 1 (highest accuracy) to 50 (lowest accuracy)

**5.17.1.30.1.4 virtual float telux::loc::ILocationInfoEx::getHorizontalDop ( ) [pure virtual]**

Retrieves horizontal dilution of precision.

**Returns**

Horizontal dilution of precision if available else returns NaN. Range: 1 (highest accuracy) to 50 (lowest accuracy)

**5.17.1.30.1.5 virtual float telux::loc::ILocationInfoEx::getVerticalDop ( ) [pure virtual]**

Retrieves vertical dilution of precision.

**Returns**

Vertical dilution of precision if available else returns NaN Range: 1 (highest accuracy) to 50 (lowest accuracy)

**5.17.1.30.1.6 virtual float telux::loc::ILocationInfoEx::getGeometricDop ( ) [pure virtual]**

Retrieves geometric dilution of precision.

**Returns**

geometric dilution of precision.

**5.17.1.30.1.7 virtual float telux::loc::ILocationInfoEx::getTimeDop ( ) [pure virtual]**

Retrieves time dilution of precision.

**Returns**

Time dilution of precision.

**5.17.1.30.1.8 virtual float telux::loc::ILocationInfoEx::getMagneticDeviation ( ) [pure virtual]**

Retrieves the difference between the bearing to true north and the bearing shown on magnetic compass. The deviation is positive when the magnetic north is east of true north.

- Units: Degrees

**Returns**

Magnetic Deviation if available else returns NaN

**5.17.1.30.1.9 virtual LocationReliability telux::loc::ILocationInfoEx::getHorizontalReliability ( ) [pure virtual]**

Specifies the reliability of the horizontal position.

**Returns**

[LocationReliability](#) of the horizontal position if available else returns UNKNOWN.

**5.17.1.30.1.10** `virtual LocationReliability telux::loc::ILocationInfoEx::getVerticalReliability ( ) [pure virtual]`

Specifies the reliability of the vertical position.

**Returns**

[LocationReliability](#) of the vertical position if available else returns UNKNOWN.

**5.17.1.30.1.11** `virtual float telux::loc::ILocationInfoEx::getHorizontalUncertaintySemiMajor ( ) [pure virtual]`

Retrieves semi-major axis of horizontal elliptical uncertainty.

- Units: Meters Uncertainty is defined with 39% confidence level.

**Returns**

Semi-major horizontal elliptical uncertainty if available else returns NaN.

**5.17.1.30.1.12** `virtual float telux::loc::ILocationInfoEx::getHorizontalUncertaintySemiMinor ( ) [pure virtual]`

Retrieves semi-minor axis of horizontal elliptical uncertainty.

- Units: Meters Uncertainty is defined with 39% confidence level.

**Returns**

Semi-minor horizontal elliptical uncertainty if available else returns NaN.

**5.17.1.30.1.13** `virtual float telux::loc::ILocationInfoEx::getHorizontalUncertaintyAzimuth ( ) [pure virtual]`

Retrieves elliptical horizontal uncertainty azimuth of orientation.

- Units: Decimal degrees
- Range: 0 to 180 Confidence for uncertainty is not specified.

**Returns**

Elliptical horizontal uncertainty azimuth of orientation if available else returns NaN.

**5.17.1.30.1.14 virtual float telux::loc::ILocationInfoEx::getEastStandardDeviation ( ) [pure virtual]**

Retrieves east standard deviation.

- Units: Meters Uncertainty is defined with 68% confidence level.

**Returns**

East Standard Deviation.

**5.17.1.30.1.15 virtual float telux::loc::ILocationInfoEx::getNorthStandardDeviation ( ) [pure virtual]**

Retrieves north standard deviation.

- Units: Meters Uncertainty is defined with 68% confidence level.

**Returns**

North Standard Deviation.

**5.17.1.30.1.16 virtual uint16\_t telux::loc::ILocationInfoEx::getNumSvUsed ( ) [pure virtual]**

Retrieves number of satellite vehicles used in position report.

**Returns**

number of Sv used.

**5.17.1.30.1.17 virtual SvUsedInPosition telux::loc::ILocationInfoEx::getSvUsedInPosition ( ) [pure virtual]**

Retrives the set of satellite vehicles that are used to calculate position.

**Returns**

set of satellite vehicles for different constellations.

**5.17.1.30.1.18 virtual void telux::loc::ILocationInfoEx::getSVIds ( std::vector< uint16\_t > & idsOfUsedSVs ) [pure virtual]**

Retrieves GNSS Satellite Vehicles used in position data.

**Parameters**

out	<i>idsOfUsedSVs</i>	Vector of Satellite Vehicle identifiers.
-----	---------------------	--

**5.17.1.30.1.19 virtual SbasCorrection telux::loc::ILocationInfoEx::getSbasCorrection ( ) [pure virtual]**

Retrieves navigation solution mask used to indicate SBAS corrections.

**Returns**

- SBAS (Satellite Based Augmentation System) Correction mask used.

**5.17.1.30.1.20 virtual GnssPositionTech telux::loc::ILocationInfoEx::getPositionTechnology ( ) [pure virtual]**

Retrieves position technology mask used to indicate which technology is used.

**Returns**

- Position technology used in computing this fix.

**5.17.1.30.1.21 virtual GnssKinematicsData telux::loc::ILocationInfoEx::getBodyFrameData ( ) [pure virtual]**

Retrieves position related information.

**5.17.1.30.1.22 virtual std::vector<GnssMeasurementInfo> telux::loc::ILocationInfoEx::getmeas↔ UsageInfo ( ) [pure virtual]**

Retrieves gnss measurement usage info.

**5.17.1.30.1.23 virtual SystemTime telux::loc::ILocationInfoEx::getGnssSystemTime ( ) [pure virtual]**

Retrieves type of gnss system.

**Returns**

- Type of Gnss System.

**5.17.1.30.1.24 virtual float telux::loc::ILocationInfoEx::getTimeUncMs ( ) [pure virtual]**

Retrieves time uncertainty. For PVT report from SPE engine, confidence level is at 99%. For PVT reports from other engines, confidence level is undefined.

**Returns**

- Time uncertainty in milliseconds.

### 5.17.1.30.1.25 virtual telux::common::Status telux::loc::ILocationInfoEx::getLeapSeconds ( uint8\_t & *leapSeconds* ) [pure virtual]

Retrieves leap seconds if available.

#### Parameters

out	<i>leapSeconds</i>	- leap seconds • Units: Seconds
-----	--------------------	------------------------------------

#### Returns

Status of leap seconds.

### 5.17.1.30.1.26 virtual telux::common::Status telux::loc::ILocationInfoEx::getVelocityEastNorthUp ( std::vector< float > & *velocityEastNorthUp* ) [pure virtual]

Retrieves east, North, Up velocity if available.

#### Parameters

out	<i>velocityEastNorthUp</i>	- east, North, Up velocity • Units: Meters/second
-----	----------------------------	--

#### Returns

Status of availability of east, North, Up velocity.

### 5.17.1.30.1.27 virtual telux::common::Status telux::loc::ILocationInfoEx::getVelocityUncertaintyEastNorthUp ( std::vector< float > & *velocityUncertaintyEastNorthUp* ) [pure virtual]

Retrieves east, North, Up velocity uncertainty if available. Uncertainty is defined with 68% confidence level.

#### Parameters

out	<i>velocity</i> <i>UncertaintyEast</i> <i>NorthUp</i>	- east, North, Up velocity uncertainty • Units: Meters/second
-----	---	--

#### Returns

Status of availability of east, North, Up velocity uncertainty.

**5.17.1.30.1.28** `virtual uint8_t telux::loc::ILocationInfoEx::getCalibrationConfidencePercent ( ) [pure virtual]`

Sensor calibration confidence percent, range [0, 100].

**Returns**

the percentage of calibration taking all the parameters into account.

**5.17.1.30.1.29** `virtual DrCalibrationStatus telux::loc::ILocationInfoEx::getCalibrationStatus ( ) [pure virtual]`

Sensor calibration status.

**Returns**

mask indicating the calibration status with respect to different parameters.

**5.17.1.30.1.30** `virtual LocationAggregationType telux::loc::ILocationInfoEx::getLocOutputEngType ( ) [pure virtual]`

Location engine type. When the type is set to LOC\_ENGINE\_SRC\_FUSED, the fix is the propagated/aggregated reports from all engines running on the system (e.g.: DR/SPE/PPE) based QTI algorithm. To check which location engine contributes to the fused output, check for locOutputEngMask.

**Returns**

the type of engine that was used for calculating the position fix.

**5.17.1.30.1.31** `virtual PositioningEngine telux::loc::ILocationInfoEx::getLocOutputEngMask ( ) [pure virtual]`

When loc output eng type is set to fused, this field indicates the set of engines contribute to the fix.

**Returns**

the combination of position engines used in calculating the position report when the loc output end type is set to fused.

**5.17.1.30.1.32** `virtual float telux::loc::ILocationInfoEx::getConformityIndex ( ) [pure virtual]`

When robust location is enabled, this field will indicate how well the various input data considered for navigation solution conforms to expectations.

**Returns**

values in the range [0.0, 1.0], with 0.0 for least conforming and 1.0 for most conforming.

**5.17.1.30.1.33** virtual LLAInfo telux::loc::ILocationInfoEx::getVRPBasedLLA ( ) [pure virtual]

Vehicle Reference Point(VRP) based latitude, longitude and altitude information.

**5.17.1.30.1.34** virtual std::vector<float> telux::loc::ILocationInfoEx::getVRPBasedENUVelocity ( ) [pure virtual]

VRP-based east, north and up velocity information.

#### Returns

- vector of directional velocities in this order {east velocity, north velocity, up velocity}

**5.17.1.30.1.35** virtual AltitudeType telux::loc::ILocationInfoEx::getAltitudeType ( ) [pure virtual]

Determination of altitude is assumed or calculated. ASSUMED means there may not be enough satellites to determine the precise altitude.

#### Returns

altitude type ASSUMED/CALCULATED or if not available then UNKNOWN.

**5.17.1.30.1.36** virtual ReportStatus telux::loc::ILocationInfoEx::getReportStatus ( ) [pure virtual]

Indicates the status of this report in terms of how optimally the report was calculated by the engine.

#### Returns

Status of the report. Returns [ReportStatus::UNKNOWN](#) if status is unavailable.

**5.17.1.30.1.37** virtual uint32\_t telux::loc::ILocationInfoEx::getIntegrityRiskUsed ( ) [pure virtual]

Integrity risk used for protection level parameters. Unit of 2.5e-10. Valid range is [1 to (4e9-1)]. Values other than valid range means integrity risk is disabled and [ILocationInfoEx::getProtectionLevelAlongTrack](#), [ILocationInfoEx::getProtectionLevelCrossTrack](#) and [ILocationInfoEx::getProtectionLevelVertical](#) will not be available.

**5.17.1.30.1.38** virtual float telux::loc::ILocationInfoEx::getProtectionLevelAlongTrack ( ) [pure virtual]

Along-track protection level at specified integrity risk, in unit of meter.

**5.17.1.30.1.39** virtual float telux::loc::ILocationInfoEx::getProtectionLevelCrossTrack ( ) [pure virtual]

Cross-track protection level at specified integrity risk, in unit of meter.

**5.17.1.30.1.40** virtual float telux::loc::!LocationInfoEx::getProtectionLevelVertical ( ) [pure virtual]

Vertical component protection level at specified integrity risk, in unit of meter.

**5.17.1.30.1.41** virtual std::vector<uint16\_t> telux::loc::!LocationInfoEx::getDgnssStationIds ( ) [pure virtual]

List of DGNSS station IDs providing corrections. Range:

- SBAS – 120 to 158 and 183 to 191
- Monitoring station – 1000-2023 (Station ID biased by 1000)
- Other values reserved.

### 5.17.1.31 class telux::loc::!SVInfo

[!SVInfo](#) provides interface to retrieve information about Satellite Vehicles, their position and health status.

#### Public member functions

- virtual [GnssConstellationType](#) getConstellation ()=0
- virtual uint16\_t getId ()=0
- virtual [SVHealthStatus](#) getSVHealthStatus ()=0
- virtual [SVStatus](#) getStatus ()=0
- virtual [SVInfoAvailability](#) getHasEphemeris ()=0
- virtual [SVInfoAvailability](#) getHasAlmanac ()=0
- virtual [SVInfoAvailability](#) getHasFix ()=0
- virtual float getElevation ()=0
- virtual float getAzimuth ()=0
- virtual float getSnr ()=0
- virtual float getCarrierFrequency ()=0
- virtual [GnssSignal](#) getSignalType ()=0
- virtual uint16\_t getGlonassFcn ()=0
- virtual double getBasebandCnr ()=0

#### 5.17.1.31.1 Member Function Documentation

**5.17.1.31.1.1 virtual GnssConstellationType telux::loc::ISVInfo::getConstellation ( ) [pure virtual]**

Indicates to which constellation this satellite vehicle belongs.

**Returns**

[GnssConstellationType](#) if available else returns UNKNOWN.

**5.17.1.31.1.2 virtual uint16\_t telux::loc::ISVInfo::getId ( ) [pure virtual]**

GNSS satellite vehicle ID. SV id range of each supported constellations mentioned in [GnssMeasurementInfo](#).

**Returns**

Identifier of the satellite vehicle otherwise 0(as 0 is not an ID for any of the SVs)

**5.17.1.31.1.3 virtual SVHealthStatus telux::loc::ISVInfo::getSVHealthStatus ( ) [pure virtual]**

Health status of satellite vehicle.

**Returns**

HealthStatus of Satellite Vehicle if available else returns UNKNOWN.

- [SVHealthStatus](#)

**5.17.1.31.1.4 virtual SVStatus telux::loc::ISVInfo::getStatus ( ) [pure virtual]**

Status of satellite vehicle.

**Note**

This API is work-in-progress and is subject to change.

**Returns**

Satellite Vehicle Status if available else returns UNKNOWN.

- [SVStatus](#)

**5.17.1.31.1.5 virtual SVInfoAvailability telux::loc::ISVInfo::getHasEphemeris ( ) [pure virtual]**

Indicates whether ephemeris information(which allows the receiver to calculate the satellite's position) is available.

**Returns**

[SVInfoAvailability](#) if Ephemeris exists or not else returns UNKNOWN.

**5.17.1.31.1.6 virtual SVInfoAvailability telux::loc::ISVInfo::getHasAlmanac ( ) [pure virtual]**

Indicates whether almanac information(which allows receivers to know which satellites are available for tracking) is available.

**Returns**

[SVInfoAvailability](#) if almanac exists or not else returns UNKNOWN.

**5.17.1.31.1.7 virtual SVInfoAvailability telux::loc::ISVInfo::getHasFix ( ) [pure virtual]**

Indicates whether the satellite is used in computing the fix.

**Returns**

[SVInfoAvailability](#), if satellite used or not else returns UNKNOWN.

**5.17.1.31.1.8 virtual float telux::loc::ISVInfo::getElevation ( ) [pure virtual]**

Retrieves satellite vehicle elevation angle.

- Units: Degrees
- Range: 0 to 90

**Returns**

Elevation if available else returns NaN.

**5.17.1.31.1.9 virtual float telux::loc::ISVInfo::getAzimuth ( ) [pure virtual]**

Retrieves satellite vehicle azimuth angle.

- Units: Degrees
- Range: 0 to 360

**Returns**

Azimuth if available else returns NaN.

**5.17.1.31.1.10 virtual float telux::loc::ISVInfo::getSnr ( ) [pure virtual]**

Retrieves signal-to-noise ratio of the signal measured at antenna of the satellite vehicle.

- Units: dB-Hz

**Returns**

SNR if available else returns 0.0 value.

**5.17.1.31.1.11 virtual float telux::loc::ISVInfo::getCarrierFrequency ( ) [pure virtual]**

Indicates the carrier frequency of the signal tracked.

**Returns**

carrier frequency in Hz else returns UNKNOWN\_CARRIER\_FREQ frequency when not supported.

**5.17.1.31.1.12 virtual GnssSignal telux::loc::ISVInfo::getSignalType ( ) [pure virtual]**

Indicates the validity for different types of signal for gps, galileo, beidou etc.

**Returns**

signalType mask else return UNKNOWN\_SIGNAL\_MASK when not supported.

**5.17.1.31.1.13 virtual uint16\_t telux::loc::ISVInfo::getGlonassFcn ( ) [pure virtual]**

Retrieves GLONASS frequency channel number in the range [1, 14] which is calculated as FCN [-7, 6] + 8.

**Returns**

GLONASS frequency channel number.

**5.17.1.31.1.14 virtual double telux::loc::ISVInfo::getBasebandCnr ( ) [pure virtual]**

Carrier-to-noise ratio of the signal measured at baseband.

- Units: dB-Hz

**Returns**

carrier-to-noise ratio at baseband else returns UNKNOWN\_BASEBAND\_CARRIER\_NOISE ratio when not supported.

**5.17.1.32 class telux::loc::IGnssSVInfo**

[IGnssSVInfo](#) provides interface to retrieve the list of SV info available and whether altitude is assumed or calculated.

**Public member functions**

- virtual [AltitudeType](#) [getAltitudeType](#) ()=0
- virtual std::vector< std::shared\_ptr< [ISVInfo](#) > > [getSVInfoList](#) ()=0

### 5.17.1.32.1 Member Function Documentation

#### 5.17.1.32.1.1 virtual AltitudeType telux::loc::IGnssSVInfo::getAltitudeType ( ) [pure virtual]

Indicates whether altitude is assumed or calculated.

#### Returns

[AltitudeType](#) if available else returns UNKNOWN.

#### 5.17.1.32.1.2 virtual std::vector<std::shared\_ptr<ISVInfo> > telux::loc::IGnssSVInfo::getSVInfoList ( ) [pure virtual]

Pointer to satellite vehicles information for all GNSS constellations except GPS.

#### Returns

Vector of pointer of [ISVInfo](#) object if available else returns empty vector.

### 5.17.1.33 class telux::loc::IGnssSignalInfo

[IGnssSignalInfo](#) provides interface to retrieve GNSS data information like jammer metrics and automatic gain control for satellite signal type.

#### Public member functions

- virtual [GnssData](#) getGnssData ()=0

### 5.17.1.33.1 Member Function Documentation

#### 5.17.1.33.1.1 virtual GnssData telux::loc::IGnssSignalInfo::getGnssData ( ) [pure virtual]

Retrieves jammer metric and Automatic Gain Control(AGC) corresponding to signal types. Jammer metric is linearly proportional to the sum of jammer and noise power at the GNSS antenna port.

#### Returns

List of jammer metric and a list of automatic gain control for signal type.

### 5.17.1.34 class telux::loc::LocationFactory

[LocationFactory](#) allows creation of location manager.

**Public member functions**

- `std::shared_ptr< ILocationManager > getLocationManager (telux::common::InitResponseCb callback=nullptr)`
- `std::shared_ptr< ILocationConfigurator > getLocationConfigurator (telux::common::InitResponseCb callback=nullptr)`
- `std::shared_ptr< IDgnssManager > getDgnssManager (DgnssDataFormat dataFormat=DgnssDataFormat::DATA_FORMAT_RTCM_3, telux::common::InitResponseCb callback=nullptr)`

**Static Public Member Functions**

- `static LocationFactory & getInstance ()`

**5.17.1.34.1 Member Function Documentation****5.17.1.34.1.1 static LocationFactory& telux::loc::LocationFactory::getInstance ( ) [static]**

Get Location Factory instance.

**5.17.1.34.1.2 std::shared\_ptr<ILocationManager> telux::loc::LocationFactory::getLocationManager ( telux::common::InitResponseCb callback = nullptr )**

Get instance of Location Manager

**Parameters**

<i>in</i>	<i>callback</i>	Optional callback to get the response of the manager initialization.
-----------	-----------------	--

**Returns**

Pointer of `ILocationManager` object.

**5.17.1.34.1.3 std::shared\_ptr<ILocationConfigurator> telux::loc::LocationFactory::getLocationConfigurator ( telux::common::InitResponseCb callback = nullptr )**

Get instance of Location Configurator.

**Parameters**

<i>in</i>	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.
-----------	-----------------	--

**Returns**

Pointer of `ILocationConfigurator` object.

**5.17.1.34.1.4** `std::shared_ptr<IDgnssManager> telux::loc::LocationFactory::getDgnssManager ( DgnssDataFormat dataFormat = DgnssDataFormat::DATA_FORMAT_RTCM_3, telux::common::InitResponseCb callback = nullptr )`

Get instance of Dgnss manager

#### Parameters

in	<i>callback</i>	Optional callback pointer to get the response of the manager initialisation.
----	-----------------	--

#### Returns

Pointer of [IDgnssManager](#) object.

### 5.17.1.35 class telux::loc::ILocationListener

Listener class for getting location updates and satellite vehicle information.

The methods in listener can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

#### Public member functions

- virtual void [onBasicLocationUpdate](#) (const std::shared\_ptr< [ILocationInfoBase](#) > &locationInfo)
- virtual void [onDetailedLocationUpdate](#) (const std::shared\_ptr< [ILocationInfoEx](#) > &locationInfo)
- virtual void [onDetailedEngineLocationUpdate](#) (const std::vector< std::shared\_ptr< [ILocationInfoEx](#) > > &locationEngineInfo)
- virtual void [onGnssSVInfo](#) (const std::shared\_ptr< [IGnssSVInfo](#) > &gnssSVInfo)
- virtual void [onGnssSignalInfo](#) (const std::shared\_ptr< [IGnssSignalInfo](#) > &info)
- virtual void [onGnssNmeaInfo](#) (uint64\_t timestamp, const std::string &nmea)
- virtual void [onGnssMeasurementsInfo](#) (const [telux::loc::GnssMeasurements](#) &measurementInfo)
- virtual void [onCapabilitiesInfo](#) (const [telux::loc::LocCapability](#) capabilityInfo)
- virtual [~ILocationListener](#) ()

#### 5.17.1.35.1 Constructors and Destructors

**5.17.1.35.1.1** `virtual telux::loc::ILocationListener::~~ILocationListener ( ) [virtual]`

Destructor of [ILocationListener](#)

#### 5.17.1.35.2 Member Function Documentation

**5.17.1.35.2.1 virtual void telux::loc::ILocationListener::onBasicLocationUpdate ( const std::shared\_ptr< ILocationInfoBase > & locationInfo ) [virtual]**

This function is called when device receives location update. When there are multiple engines running on the system, the received location information is fused report from all engines.

**Parameters**

in	<i>locationInfo</i>	- Location information like latitude, longitude, timeInfo other information such as heading, altitude and velocity etc.
----	---------------------	---

**5.17.1.35.2.2 virtual void telux::loc::ILocationListener::onDetailedLocationUpdate ( const std::shared\_ptr< ILocationInfoEx > & locationInfo ) [virtual]**

This function is called when device receives Gns location update. When there are multiple engines running on the system, the received location information is fused report from all engines.

**Parameters**

in	<i>locationInfo</i>	- Contains richer set of location information like latitude, longitude, timeInfo, heading, altitude, velocity and other information such as deviations, elliptical accuracies etc.
----	---------------------	--

**5.17.1.35.2.3 virtual void telux::loc::ILocationListener::onDetailedEngineLocationUpdate ( const std::vector< std::shared\_ptr< ILocationInfoEx > > & locationEngineInfo ) [virtual]**

This function is called when device receives multiple Gns location update from the different engine types requested, which are SPE/PPE/FUSED. This API will be called ONLY if we use startDetailedEngineReports.

**Parameters**

in	<i>locationInfo</i>	- Contains a list of location infos. Each element in the list corresponds to one of SPE/PPE/FUSED.
----	---------------------	--

**5.17.1.35.2.4 virtual void telux::loc::ILocationListener::onGnssSVInfo ( const std::shared\_ptr< IGnssSVInfo > & gnssSVInfo ) [virtual]**

This function is called when device receives GNSS satellite information.

**Parameters**

in	<i>gnssSVInfo</i>	- GNSS satellite information
----	-------------------	------------------------------

#### 5.17.1.35.2.5 virtual void telux::loc::ILocationListener::onGnssSignalInfo ( const std::shared\_ptr< IGnssSignalInfo > & info ) [virtual]

This function is called when device receives GNSS data information like jammer metrics and automatic gain control for satellite signal type.

##### Parameters

in	<i>info</i>	- GNSS signal info
----	-------------	--------------------

#### 5.17.1.35.2.6 virtual void telux::loc::ILocationListener::onGnssNmealInfo ( uint64\_t timestamp, const std::string & nmea ) [virtual]

This function is called when device receives GNSS NMEA sentences.

##### Parameters

in	<i>timestamp</i>	- Timestamp
in	<i>nmea</i>	- Nmea sentence

#### 5.17.1.35.2.7 virtual void telux::loc::ILocationListener::onGnssMeasurementsInfo ( const telux::loc::GnssMeasurements & measurementInfo ) [virtual]

This function is called when device receives signal measurement information such as satellite vehicle pseudo range, satellite vehicle clock time, carrier phase measurement etc. The frequency at which this API is called is determined by what was requested GnssReportType::MEASUREMENT or GnssReportType::HIGH\_RATE\_MEASUREMENT in [ILocationManager::startDetailedReports](#) and [ILocationManager::startDetailedEngineReports](#).

##### Parameters

in	<i>measurementInfo</i>	- GNSS measurement information
----	------------------------	--------------------------------

#### 5.17.1.35.2.8 virtual void telux::loc::ILocationListener::onCapabilitiesInfo ( const telux::loc::Loc↔Capability capabilityInfo ) [virtual]

This function is called when the capabilities of the location stack gets updated.

##### Parameters

in	<i>capabilityInfo</i>	- <a href="#">telux::loc::LocCapability</a> , capability information
----	-----------------------	--

### 5.17.1.36 class telux::loc::ILocationSystemInfoListener

**Public member functions**

- virtual void [onLocationSystemInfo](#) (const [LocationSystemInfo](#) &locationSystemInfo)
- virtual [~ILocationSystemInfoListener](#) ()

**5.17.1.36.1 Constructors and Destructors**

**5.17.1.36.1.1** virtual [telux::loc::ILocationSystemInfoListener::~~ILocationSystemInfoListener](#) ( )  
[virtual]

Destructor of [ILocationSystemInfoListener](#)

**5.17.1.36.2 Member Function Documentation**

**5.17.1.36.2.1** virtual void [telux::loc::ILocationSystemInfoListener::onLocationSystemInfo](#) ( const [LocationSystemInfo](#) & *locationSystemInfo* ) [virtual]

This function is called when device receives location related system information such as leap second change.

**Parameters**

in	<i>locationSystemInfo</i>	- contains location system information such as current leap seconds change
----	---------------------------	--

**5.17.1.37 class [telux::loc::ILocationConfigListener](#)**

[ILocationConfigListener](#) interface is used to receive notifications related to configuration events.

The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

**Public member functions**

- virtual void [onXtraStatusUpdate](#) (const [XtraStatus](#) xtraStatus)
- virtual [~ILocationConfigListener](#) ()

**5.17.1.37.1 Constructors and Destructors**

**5.17.1.37.1.1** virtual [telux::loc::ILocationConfigListener::~~ILocationConfigListener](#) ( ) [virtual]

**5.17.1.37.2 Member Function Documentation**

### 5.17.1.37.2.1 virtual void telux::loc::ILocationConfigListener::onXtraStatusUpdate ( const XtraStatus xtraStatus ) [virtual]

The API is invoked when there is any update in the Xtra assistance data.

in	<i>xtraStatus</i>	- Xtra assistant data's current status, validity and whether it is enabled.
----	-------------------	---

### 5.17.1.38 class telux::loc::ILocationManager

[ILocationManager](#) provides interface to register and remove listeners. It also allows to set and get configuration/ criteria for position reports. The new APIs([registerListenerEx](#), [deRegisterListenerEx](#), [startDetailedReports](#), [startBasicReports](#)) and old/deprecated APIs([registerListener](#), [removeListener](#), [setPositionReportTimeout](#), [setHorizontalAccuracyLevel](#), [setMinIntervalForReports](#)) should not be used interchangeably, either the new APIs should be used or the old APIs should be used.

#### Public Types

- using [GetEnergyConsumedCallback](#) = std::function< void([telux::loc::GnssEnergyConsumedInfo](#) energyConsumed, [telux::common::ErrorCode](#) error)>
- using [GetYearOfHwCallback](#) = std::function< void(uint16\_t yearOfHw, [telux::common::ErrorCode](#) error)>
- using [GetTerrestrialInfoCallback](#) = std::function< void(const std::shared\_ptr< [ILocationInfoBase](#) > terrestrialInfo)>

#### Public member functions

### 5.17.1.38.1 Member Typedef Documentation

**5.17.1.38.1.1** using [telux::loc::ILocationManager::GetEnergyConsumedCallback](#) = std::function<void([telux::loc::GnssEnergyConsumedInfo](#) energyConsumed, [telux::common::ErrorCode](#) error)>

This function is called with the response to [getEnergyConsumedInfoUpdate](#) API.

#### Parameters

in	<i>energyConsumed</i>	- Information regarding energy consumed by Gnss engine.
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

**5.17.1.38.1.2** using [telux::loc::ILocationManager::GetYearOfHwCallback](#) = std::function<void(uint16\_t yearOfHw, [telux::common::ErrorCode](#) error)>

This function is called with the response to [getYearOfHw](#) API.

#### Parameters

in	<i>yearOfHw</i>	- Year of hardware information.
in	<i>error</i>	- Return code which indicates whether the operation succeeded or not.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.38.1.3** using [telux::loc::ILocationManager::GetTerrestrialInfoCallback](#) = std::function<void(const std::shared\_ptr<[ILocationInfoBase](#)> terrestrialInfo)>

This function is called with the response to [getTerrestrialPosition](#) API.

in	<i>terrestrialInfo</i>	- basic position related information.
----	------------------------	---------------------------------------

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.38.2 Constructors and Destructors**

**5.17.1.38.2.1** `virtual telux::loc::ILocationManager::~~ILocationManager ( ) [virtual]`

Destructor of [ILocationManager](#)

**5.17.1.38.3 Member Function Documentation**

**5.17.1.38.3.1** `virtual bool telux::loc::ILocationManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of location subsystems and returns the result.

**Returns**

True if location subsystem is ready for service otherwise false.

**Deprecated** use [getServiceStatus\(\)](#)

**5.17.1.38.3.2** `virtual telux::common::ServiceStatus telux::loc::ILocationManager::getServiceStatus ( ) [pure virtual]`

This status indicates whether the object is in a usable state.

**Returns**

SERVICE\_AVAILABLE - If location manager is ready for service. SERVICE\_UNAVAILABLE - If location manager is temporarily unavailable. SERVICE\_FAILED - If location manager encountered an irrecoverable failure.

**5.17.1.38.3.3** `virtual std::future<bool> telux::loc::ILocationManager::onSubsystemReady ( ) [pure virtual]`

Wait for location subsystem to be ready.

**Returns**

A future that caller can wait on to be notified when location subsystem is ready.

**Deprecated** The callback mechanism introduced in the [LocationFactory::getLocationManager\(\)](#) API will provide the similar notification mechanism as [onSubsystemReady\(\)](#). This API will soon be removed from further releases.

#### 5.17.1.38.3.4 virtual telux::common::Status telux::loc::ILocationManager::registerListenerEx ( std::weak\_ptr< ILocationListener > *listener* ) [pure virtual]

Register a listener for specific updates from location manager like location, jamming info and satellite vehicle info. If enhanced position, using Dead Reckoning etc., is enabled, enhanced fixes will be provided. Otherwise raw GNSS fixes will be provided. The position reports will start only when startDetailedReports or startBasicReports is invoked.

##### Parameters

in	<i>listener</i>	- Pointer of <a href="#">ILocationListener</a> object that processes the notification.
----	-----------------	--

##### Returns

Status of registerListener i.e success or suitable status code.

#### 5.17.1.38.3.5 virtual telux::common::Status telux::loc::ILocationManager::deRegisterListenerEx ( std::weak\_ptr< ILocationListener > *listener* ) [pure virtual]

Remove a previously registered listener.

##### Parameters

in	<i>listener</i>	- Previously registered <a href="#">ILocationListener</a> that needs to be removed.
----	-----------------	---

##### Returns

Status of removeListener success or suitable status code

#### 5.17.1.38.3.6 virtual telux::common::Status telux::loc::ILocationManager::startDetailedReports ( uint32\_t *interval*, telux::common::ResponseCallback *callback* = *nullptr*, GnssReportTypeMask *reportMask* = DEFAULT\_GNSS\_REPORT ) [pure virtual]

Starts the richer location reports by configuring the time between them as the interval. Any of the 3 APIs that is startDetailedReports or startDetailedEngineReports or startBasicReports can be called one after the other irrespective of order, without calling stopReports in between any of them and the API which is called last will be honored for providing the callbacks. In case of multiple clients invoking this API with different intervals, if the platforms is configured, then the clients will receive the reports at their requested intervals. If not configured then all the clients will be serviced at the smallest interval among all clients' intervals. The supported periodicities are 100ms, 200ms, 500ms, 1sec, 2sec, nsec and a periodicity that a caller send which is not one of these will result in the implementation picking one of these periodicities. Calling this Api will result in [ILocationListener::onDetailedLocationUpdate](#), [ILocationListener::onGnssSVInfo](#), [ILocationListener::onGnssSignalInfo](#), [ILocationListener::onGnssNmeaInfo](#) and [ILocationListener::onGnssMeasurementsInfo](#) APIs on the listener being invoked, assuming they have not been disabled using the GnssReportTypeMask. If a client issues second request to this API then new request for GnssReportTypeMask will over write the previous call to this API.

in	<i>interval</i>	- Minimum time interval between two consecutive reports in milliseconds.
----	-----------------	--

E.g. If minInterval is 1000 milliseconds, reports will be provided with a periodicity of 1 second or more depending on the number of applications listening to location updates.

#### Parameters

in	<i>callback</i>	- Optional callback to get the response of set minimum interval for reports.
in	<i>reportMask</i>	- Optional field to specify which reports a client is interested in. By default all the reports will be enabled.

#### Returns

Status of startDetailedReports i.e. success or suitable status code.

```
5.17.1.38.3.7 virtual telux::common::Status telux::loc::ILocationManager::startDetailedEngineReports
( uint32_t interval, LocReqEngine engineType, telux::common::ResponseCallback
callback = nullptr, GnssReportTypeMask reportMask = DEFAULT_GNSS_REPORT )
[pure virtual]
```

Starts a session which may provide richer default combined position reports and position reports from other engines. The fused position report type will always be supported if at least one engine in the system is producing valid report. Any of the 3 APIs that is startDetailedReports or startDetailedEngineReports or startBasicReports can be called one after the other irrespective of order, without calling stopReports in between any of them and the API which is called last will be honored for providing the callbacks. In case of multiple clients invoking this API with different intervals, if the platform is configured, then the clients will receive the reports at their requested intervals. If not configured then all the clients will be serviced at the smallest interval among all clients' intervals. The supported periodicities are 100ms, 200ms, 500ms, 1sec, 2sec, nsec and a periodicity that a caller send which is not one of these will result in the implementation picking one of these periodicities. Calling this Api will result in [ILocationListener::onDetailedEngineLocationUpdate](#), [ILocationListener::onGnssSVInfo](#), [ILocationListener::onGnssSignalInfo](#), [ILocationListener::onGnssNmeaInfo](#) and [ILocationListener::onGnssMeasurementsInfo](#) APIs on the listener being invoked, assuming they have not been disabled using the GnssReportTypeMask. If a client issues second request to this API then new request for GnssReportTypeMask will over write the previous call to this API.

#### Parameters

in	<i>interval</i>	- Minimum time interval between two consecutive reports in milliseconds.
----	-----------------	--

E.g. If minInterval is 1000 milliseconds, reports will be provided with a periodicity of 1 second or more depending on the number of applications listening to location updates.

in	<i>engineType</i>	- The type of engine requested for fixes such as SPE or PPE or FUSED. The FUSED includes all the engines that are running to generate the fixes such as reports from SPE, PPE and DRE.
in	<i>callback</i>	- Optional callback to get the response of set minimum interval for reports.
in	<i>reportMask</i>	- Optional field to specify which reports a client is interested in. By default all the reports will be enabled.

## Returns

Status of startDetailedEngineReports i.e. success or suitable status code.

**5.17.1.38.3.8 virtual telux::common::Status telux::loc::ILocationManager::startBasicReports ( uint32\_t distanceInMeters, uint32\_t intervalInMs, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

Starts the Location report by configuring the time and distance between the consecutive reports. Any of the 3 APIs that is startDetailedReports or startDetailedEngineReports or startBasicReports can be called one after the other irrespective of order, without calling stopReports in between any of them and the API which is called last will be honored for providing the callbacks. In case of multiple clients invoking this API with different intervals, if the platforms is configured, then the clients will receive the reports at their requested intervals. If not configured then all the clients will be serviced at the smallest interval among all clients' intervals. The supported periodicities are 100ms, 200ms, 500ms, 1sec, 2sec, nsec and a periodicity that a caller send which is not one of these will result in the implementation picking one of these periodicities. This Api enables the onBasicLocationUpdate Api on the listener.

## Parameters

in	<i>distanceInMeters</i>	- distanceInMeters between two consecutive reports in meters. intervalInMs - Minimum time interval between two consecutive reports in milliseconds.
----	-------------------------	--

E.g. If intervalInMs is 1000 milliseconds and distanceInMeters is 100m, reports will be provided according to the condition that happens first. So we need to provide both the parameters for evaluating the report.

The underlying system may have a minimum distance threshold(e.g. 1 meter). Effective distance will not be smaller than this lower bound.

The effective distance may have a granularity level higher than 1 m, e.g. 5 m. So distanceInMeters being 59 may be honored at 60 m, depending on the system.

Where there is another application in the system having a session with shorter distance, this client may benefit and receive reports at that distance.

## Parameters

in	<i>callback</i>	- Optional callback to get the response of set minimum distance for reports.
----	-----------------	--

**Returns**

Status of startBasicReports i.e. success or suitable status code.

**5.17.1.38.3.9** `virtual telux::common::Status telux::loc::ILocationManager::registerForSystemInfoUpdates ( std::weak_ptr< ILocationSystemInfoListener > listener, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API registers a [ILocationSystemInfoListener](#) listener and will receive information related to location system that are not tied with location fix session, e.g.: next leap second event. The startBasicReports, startDetailedReports, startDetailedEngineReports does not need to be called before calling this API, in order to receive updates.

**Parameters**

in	<i>listener</i>	- Pointer of <a href="#">ILocationSystemInfoListener</a> object.
in	<i>callback</i>	- Optional callback to get the response of location system info.

**Returns**

Status of getLocationSystemInfo i.e success or suitable status code.

**5.17.1.38.3.10** `virtual telux::common::Status telux::loc::ILocationManager::deRegisterForSystemInfoUpdates ( std::weak_ptr< ILocationSystemInfoListener > listener, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API removes a previously registered listener and will also stop receiving informations related to location system for that particular listener.

**Parameters**

in	<i>listener</i>	- Previously registered <a href="#">ILocationSystemInfoListener</a> that needs to be removed.
in	<i>callback</i>	- Optional callback to get the response of location system info.

**Returns**

Status of deRegisterForSystemInfoUpdates success or suitable status code.

**5.17.1.38.3.11** `virtual telux::common::Status telux::loc::ILocationManager::requestEnergyConsumedInfo ( GetEnergyConsumedCallback cb ) [pure virtual]`

This API receives information on energy consumed by modem GNSS engine. If this API is called on this object while this is already a pending request, then it will overwrite the callback to be invoked and the callback from the previous invocation will not be called.

**Parameters**

in	<i>cb</i>	- callback to get the information of Gnss energy consumed.
----	-----------	--

**Returns**

Status of requestEnergyConsumedInfo i.e success or suitable status code.

**5.17.1.38.3.12 virtual telux::common::Status telux::loc::ILocationManager::stopReports ( telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]**

This API will stop reports started using startDetailedReports or startBasicReports or registerListener or setMinIntervalForReports.

**Parameters**

in	<i>callback</i>	- Optional callback to get the response of stop reports.
----	-----------------	--

**Returns**

Status of stopReports i.e. success or suitable status code.

**5.17.1.38.3.13 virtual telux::common::Status telux::loc::ILocationManager::getYearOfHw ( GetYearOfHwCallback *cb* ) [pure virtual]**

This API retrieves the year of hardware information.

**Parameters**

in	<i>cb</i>	- callback to get information of year of hardware.
----	-----------	--

**Returns**

Status of getYearOfHw i.e success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.38.3.14 virtual telux::common::Status telux::loc::ILocationManager::getTerrestrialPosition ( uint32\_t *timeoutMsec*, TerrestrialTechnology *techMask*, GetTerrestrialInfoCallback *cb*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]**

This API retrieves single-shot terrestrial position using the set of specified terrestrial technologies. This API can be invoked even while there is an on-going tracking session that was started using startBasicReports/startDetailedReports/startDetailedEngineReports. If this API is invoked while there is already a pending request for terrestrial position, the request will fail and ResponseCallback will get invoked with ErrorCode::OP\_IN\_PROGRESS. To cancel a pending request, use [ILocationManager::cancelTerrestrialPositionRequest](#). Before using this API, user consent needs to be set true via [ILocationConfigurator::provideConsentForTerrestrialPositioning](#).

in	<i>timeoutMsec</i>	- the time in milliseconds within which the client is expecting a response. If the system is unable to provide a report within this time, the ResponseCallback will be invoked with ErrorCode::OPERATION_TIMEOUT.
in	<i>techMask</i>	- the set of terrestrial technologies that are allowed to be used for producing the position.
in	<i>cb</i>	- callback to receive terrestrial position. This callback will only be invoked when ResponseCallback is invoked with SUCCESS.
in	<i>callback</i>	- Optional callback to get the response of getTerrestrialPosition.

### Returns

Status of getTerrestrialPosition i.e success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.38.3.15** `virtual telux::common::Status telux::loc::ILocationManager::cancelTerrestrial←  
PositionRequest ( telux::common::ResponseCallback callback = nullptr ) [pure  
virtual]`

This API cancels the pending request invoked by [ILocationManager::getTerrestrialPosition](#). If this API is invoked while there is no pending request for terrestrial position from [ILocationManager::getTerrestrialPosition](#), then ResponseCallback will be invoked with ErrorCode::INVALID\_ARGUMENTS.

### Parameters

in	<i>callback</i>	- Optional callback to get the response of cancelTerrestrialPositionRequest.
----	-----------------	--

### Returns

Status of cancelTerrestrialPositionRequest i.e success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.17.1.38.3.16** `virtual telux::loc::LocCapability telux::loc::ILocationManager::getCapabilities ( )  
[pure virtual]`

This API retrieves capability information.

<i>in</i>	<i>cb</i>	- callback to get information related to capability.
-----------	-----------	--

## Returns

Status of getCapabilities i.e success or suitable status code.

## Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.17.2 Enumeration Type Documentation

### 5.17.2.1 enum telux::loc::DgnssDataFormat [strong]

Defines RTCM injection data format

#### Enumerator

**DATA\_FORMAT\_UNKNOWN** Source data format is unknown  
**DATA\_FORMAT\_RTCM\_3** Source data format is RTCM\_3  
**DATA\_FORMAT\_3GPP\_RTK\_R15** Source data format is 3GPP RTK Rel-15

### 5.17.2.2 enum telux::loc::DgnssStatus [strong]

Defines status reported by cdfw for RTCM injection.

#### Enumerator

**DATA\_SOURCE\_NOT\_SUPPORTED** Dgnss subsystem doesn't support the data source  
**DATA\_FORMAT\_NOT\_SUPPORTED** Dgnss subsystem doesn't support the data format  
**OTHER\_SOURCE\_IN\_USE** After the source injects the data, dgnss subsystem discovers there is another higher priority source injecting the data at the same time, and the current injected data is dropped  
**MESSAGE\_PARSE\_ERROR** There is a parsing error such as unrecognized format, CRC check failure, value range check failure, etc.; the injected data is dropped  
**DATA\_SOURCE\_NOT\_USABLE** Data source is not usable anymore

### 5.17.2.3 enum telux::loc::HorizontalAccuracyLevel [strong]

Defines the horizontal accuracy level of the fix.

#### Enumerator

**LOW** Client requires low horizontal accuracy  
**MEDIUM** Client requires medium horizontal accuracy  
**HIGH** Client requires high horizontal accuracy

### 5.17.2.4 enum telux::loc::LocationReliability [strong]

Specifies the reliability of the position.

#### Enumerator

**UNKNOWN** Unknown location reliability  
**NOT\_SET** Location reliability is not set. The reliability of this position report could not be determined. It could be unreliable/reliable  
**VERY\_LOW** Location reliability is very low  
**LOW** Location reliability is low, little or no cross-checking is possible  
**MEDIUM** Location reliability is medium, limited cross-check passed  
**HIGH** Location reliability is high, strong cross-check passed

### 5.17.2.5 enum telux::loc::SbasCorrectionType

Specify set of navigation solutions that contribute to Gnss Location. Defines Satellite Based Augmentation System(SBAS) corrections. SBAS contributes to improve the performance of GNSS system.

#### Enumerator

**SBAS\_CORRECTION\_IONO** Bit mask to specify whether SBAS ionospheric correction is used  
**SBAS\_CORRECTION\_FAST** Bit mask to specify whether SBAS fast correction is used  
**SBAS\_CORRECTION\_LONG** Bit mask to specify whether SBAS long correction is used  
**SBAS\_INTEGRITY** Bit mask to specify whether SBAS integrity information is used  
**SBAS\_CORRECTION\_DGNSS** Bit mask to specify whether SBAS DGNSS correction is used  
**SBAS\_CORRECTION\_RTK** Bit mask to specify whether SBAS RTK correction is used  
**SBAS\_CORRECTION\_PPP** Bit mask to specify whether SBAS PPP correction is used  
**SBAS\_CORRECTION\_RTK\_FIXED** Bit mask to specify whether SBAS RTK fixed correction is used  
**SBAS\_CORRECTION\_ONLY\_SBAS\_CORRECTED\_SV\_USED\_** Bit mask to specify only SBAS corrected SV is used  
**SBAS\_COUNT** Bitset

### 5.17.2.6 enum telux::loc::AltitudeType [strong]

Indicates whether altitude is assumed or calculated.

#### Enumerator

**UNKNOWN** Unknown altitude type  
**CALCULATED** Altitude is calculated  
**ASSUMED** Altitude is assumed, there may not be enough satellites to determine the precise altitude

### 5.17.2.7 enum telux::loc::GnssConstellationType [strong]

Defines constellation type of GNSS.

#### Enumerator

**UNKNOWN** Unknown constellation type  
**GPS** GPS satellite  
**GALILEO** GALILEO satellite

**SBAS** SBAS satellite  
**COMPASS** COMPASS satellite.  
**Deprecated** constellation type is not supported.  
**GLONASS** GLONASS satellite  
**BDS** BDS satellite  
**QZSS** QZSS satellite  
**NAVIC** NAVIC satellite

#### 5.17.2.8 enum telux::loc::SVHealthStatus [strong]

Health status indicates whether satellite is operational or not. This information comes from the most recent data transmitted in satellite almanacs.

##### Enumerator

**UNKNOWN** Unknown sv health status  
**UNHEALTHY** satellite is not operational and cannot be used in position calculations  
**HEALTHY** satellite is fully operational

#### 5.17.2.9 enum telux::loc::SVStatus [strong]

Satellite vehicle processing status.

##### Enumerator

**UNKNOWN** Unknown sv status  
**IDLE** SV is not being actively processed  
**SEARCH** The system is searching for this SV  
**TRACK** SV is being tracked

#### 5.17.2.10 enum telux::loc::SVInfoAvailability [strong]

Indicates whether Satellite Vehicle info like ephemeris and almanac are present or not

##### Enumerator

**UNKNOWN** Unknown sv info availability  
**YES** Ephemeris or Almanac exists  
**NO** Ephemeris or Almanac doesn't exist

#### 5.17.2.11 enum telux::loc::GnssPositionTechType

Specifies which position technology was used to generate location information in the [ILocationInfoEx](#).

##### Enumerator

**GNSS\_DEFAULT** Technology used to generate location info is unknown.  
**GNSS\_SATELLITE** Satellites-based technology was used to generate location info.  
**GNSS\_CELLID** Cell towers were used to generate location info.  
**GNSS\_WIFI** Wi-Fi access points were used to generate location info.  
**GNSS\_SENSORS** Sensors were used to generate location info.

**GNSS\_REFERENCE\_LOCATION** Reference location was used to generate location info.  
**GNSS\_INJECTED\_COARSE\_POSITION** Coarse position injected into the location engine was used to generate location info.  
**GNSS\_AFLT** AFLT was used to generate location info.  
**GNSS\_HYBRID** GNSS and network-provided measurements were used to generate location info.  
**GNSS\_PPE** Precise position engine was used to generate location info.  
**GNSS\_VEHICLE** Location was calculated using Vehicular data.  
**GNSS\_VISUAL** Location was calculated using Visual data.  
**GNSS\_PROPAGATED** Location was calculated using Propagation logic, which uses cached measurements.

### 5.17.2.12 enum telux::loc::KinematicDataValidityType

Specifies related kinematics mask

#### Enumerator

**HAS\_LONG\_ACCEL** Navigation data has Forward Acceleration  
**HAS\_LAT\_ACCEL** Navigation data has Sideward Acceleration  
**HAS\_VERT\_ACCEL** Navigation data has Vertical Acceleration  
**HAS\_YAW\_RATE** Navigation data has Heading Rate  
**HAS\_PITCH** Navigation data has Body pitch  
**HAS\_LONG\_ACCEL\_UNC** Navigation data has Forward Acceleration  
**HAS\_LAT\_ACCEL\_UNC** Navigation data has Sideward Acceleration  
**HAS\_VERT\_ACCEL\_UNC** Navigation data has Vertical Acceleration  
**HAS\_YAW\_RATE\_UNC** Navigation data has Heading Rate  
**HAS\_PITCH\_UNC** Navigation data has Body pitch  
**HAS\_PITCH\_RATE\_BIT** Navigation data has Body pitch rate  
**HAS\_PITCH\_RATE\_UNC\_BIT** Navigation data has Body pitch rate uncertainty  
**HAS\_ROLL\_BIT** Navigation data has roll  
**HAS\_ROLL\_UNC\_BIT** Navigation data has roll uncertainty  
**HAS\_ROLL\_RATE\_BIT** Navigation data has roll rate  
**HAS\_ROLL\_RATE\_UNC\_BIT** Navigation data has roll rate uncertainty  
**HAS\_YAW\_BIT** Navigation data has yaw  
**HAS\_YAW\_UNC\_BIT** Navigation data has yaw uncertainty

### 5.17.2.13 enum telux::loc::GnssSystem [strong]

Specify the different types of constellation supported.

#### Enumerator

**GNSS\_LOC\_SV\_SYSTEM\_UNKNOWN** UNKNOWN satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_GPS** GPS satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_GALILEO** GALILEO satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_SBAS** SBAS satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_COMPASS** COMPASS satellite.

**Deprecated** constellation type is not supported.  
**GNSS\_LOC\_SV\_SYSTEM\_GLONASS** GLONASS satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_BDS** BDS satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_QZSS** QZSS satellite.  
**GNSS\_LOC\_SV\_SYSTEM\_NAVIC** NAVIC satellite.

#### 5.17.2.14 enum telux::loc::GnssTimeValidityType

Validity field for different system time in struct [TimeInfo](#).

##### Enumerator

**GNSS\_SYSTEM\_TIME\_WEEK\_VALID** valid systemWeek.  
**GNSS\_SYSTEM\_TIME\_WEEK\_MS\_VALID** valid systemMsec  
**GNSS\_SYSTEM\_CLK\_TIME\_BIAS\_VALID** valid systemClkTimeBias  
**GNSS\_SYSTEM\_CLK\_TIME\_BIAS\_UNC\_VALID** valid systemClkTimeUncMs  
**GNSS\_SYSTEM\_REF\_FCOUNT\_VALID** valid refFCount  
**GNSS\_SYSTEM\_NUM\_CLOCK\_RESETS\_VALID** valid numClockResets

#### 5.17.2.15 enum telux::loc::GlonassTimeValidity

Validity field for GLONASS time in struct [GlonassTimeInfo](#).

##### Enumerator

**GNSS\_CLO\_DAYS\_VALID** valid gloDays  
**GNSS\_GLOS\_MSEC\_VALID** valid gloMsec  
**GNSS\_GLO\_CLK\_TIME\_BIAS\_VALID** valid gloClkTimeBias  
**GNSS\_GLO\_CLK\_TIME\_BIAS\_UNC\_VALID** valid gloClkTimeUncMs  
**GNSS\_GLO\_REF\_FCOUNT\_VALID** valid refFCount  
**GNSS\_GLO\_NUM\_CLOCK\_RESETS\_VALID** valid numClockResets  
**GNSS\_GLO\_FOUR\_YEAR\_VALID** valid gloFourYear

#### 5.17.2.16 enum telux::loc::GnssSignalType

Specify GNSS Signal Type and RF Band used in struct [GnssMeasurementInfo](#) and [ISVInfo](#) class.

##### Enumerator

**GPS\_L1CA** Gnss signal is of GPS L1CA RF Band.  
**GPS\_L1C** Gnss signal is of GPS L1C RF Band.  
**GPS\_L2** Gnss signal is of GPS L2 RF Band.  
**GPS\_L5** Gnss signal is of GPS L5 RF Band.  
**GLONASS\_G1** Gnss signal is of GLONASS G1 (L1OF) RF Band.  
**GLONASS\_G2** Gnss signal is of GLONASS G2 (L2OF) RF Band.  
**GALILEO\_E1** Gnss signal is of GALILEO E1 RF Band.  
**GALILEO\_E5A** Gnss signal is of GALILEO E5A RF Band.  
**GALILEO\_E5B** Gnss signal is of GALILEO E5B RF Band.  
**BEIDOU\_B1** Gnss signal is of BEIDOU B1 RF Band.  
**BEIDOU\_B2** Gnss signal is of BEIDOU B2 RF Band.  
**QZSS\_L1CA** Gnss signal is of QZSS L1CA RF Band.

**QZSS\_L1S** Gnss signal is of QZSS L1S RF Band.  
**QZSS\_L2** Gnss signal is of QZSS L2 RF Band.  
**QZSS\_L5** Gnss signal is of QZSS L5 RF Band.  
**SBAS\_L1** Gnss signal is of SBAS L1 RF Band.  
**BEIDOU\_B1I** Gnss signal is of BEIDOU B1I RF Band.  
**BEIDOU\_B1C** Gnss signal is of BEIDOU B1C RF Band.  
**BEIDOU\_B2I** Gnss signal is of BEIDOU B2I RF Band.  
**BEIDOU\_B2AI** Gnss signal is of BEIDOU B2AI RF Band.  
**NAVIC\_L5** Gnss signal is of NAVIC L5 RF Band.  
**BEIDOU\_B2AQ** Gnss signal is of BEIDOU B2A\_Q RF Band.

### 5.17.2.17 enum telux::loc::LocCapabilityType

Specify Location Capabilities Type.

#### Enumerator

**TIME\_BASED\_TRACKING** Support time based tracking session via [ILocationManager::startDetailedReports](#), [ILocationManager::startDetailedEngineReports](#) and [ILocationManager::startBasicReports](#) with `distanceInMeters` set to 0.  
**DISTANCE\_BASED\_TRACKING** Support distance based tracking session via [ILocationManager::startBasicReports](#) with `distanceInMeters` specified.  
**GNSS\_MEASUREMENTS** Support Gnss Measurement data via [ILocationListener::onGnssMeasurementsInfo](#) when a tracking session is enabled.  
**CONSTELLATION\_ENABLEMENT** Support configure constellations via [ILocationConfigurator::configureConstellations](#).  
**CARRIER\_PHASE** Support carrier phase for Precise Positioning Measurement Engine (PPME).  
**QWES\_GNSS\_SINGLE\_FREQUENCY** Support GNSS Single Frequency feature.  
**QWES\_GNSS\_MULTI\_FREQUENCY** Supports GNSS Multi Frequency feature.  
**QWES\_VPE** Support VEPP license bundle is enabled. VEPP bundle include Carrier Phase features.  
**QWES\_CV2X\_LOCATION\_BASIC** Support for CV2X Location basic features. This includes features for GTS Time & Freq, [ILocationConfigurator::configureCTunc](#).  
**QWES\_CV2X\_LOCATION\_PREMIUM** Support for CV2X Location premium features. This includes features for CV2X Location Basic features, QDR3 feature and [ILocationConfigurator::configurePACE](#).  
**QWES\_PPE** Support PPE (Precise Positioning Engine) library is enabled or Precise Positioning Framework (PPF) is available. This includes features for Carrier Phase and SV Ephemeris.  
**QWES\_QDR2** Support QDR2\_C license bundle is enabled.  
**QWES\_QDR3** Support QDR3\_C license bundle is enabled.

### 5.17.2.18 enum telux::loc::LocationTechnologyType

Specify the set of technologies that contribute to [ILocationInfoBase](#).

#### Enumerator

**LOC\_GNSS** Location was calculated using GNSS-based technology.  
**LOC\_CELL** Location was calculated using Cell-based technology.  
**LOC\_WIFI** Location was calculated using WiFi-based technology.  
**LOC\_SENSORS** Location was calculated using Sensors-based technology.

- LOC\_REFERENCE\_LOCATION** Location was calculated using Reference location.
- LOC\_INJECTED\_COARSE\_POSITION** Location was calculated using Coarse position injected into the location engine.
- LOC\_AFLT** Location was calculated using AFLT.
- LOC\_HYBRID** Location was calculated using GNSS and network-provided measurements.
- LOC\_PPE** Location was calculated using Precise position engine.
- LOC\_VEH** Location was calculated using Vehicular data.
- LOC\_VIS** Location was calculated using Visual data.
- LOC\_PROPAGATED** Location was calculated using Propagation logic, which uses cached measurements.

### 5.17.2.19 enum telux::loc::LocationValidityType

Specify the valid fields in LocationInfoValidity User should determine whether a field in LocationInfoValidity is valid or not by checking the corresponding bit is set or not.

#### Enumerator

- HAS\_LAT\_LONG\_BIT** Location has valid latitude and longitude.
- HAS\_ALTITUDE\_BIT** Location has valid altitude.
- HAS\_SPEED\_BIT** Location has valid speed.
- HAS\_HEADING\_BIT** Location has valid heading.
- HAS\_HORIZONTAL\_ACCURACY\_BIT**
- HAS\_VERTICAL\_ACCURACY\_BIT** Location has valid vertical accuracy.
- HAS\_SPEED\_ACCURACY\_BIT** Location has valid speed accuracy.
- HAS\_HEADING\_ACCURACY\_BIT** Location has valid heading accuracy.
- HAS\_TIMESTAMP\_BIT** Location has valid timestamp.
- HAS\_ELAPSED\_REAL\_TIME\_BIT** Location has valid elapsed real time.
- HAS\_ELAPSED\_REAL\_TIME\_UNC\_BIT** Location has valid elapsed real time uncertainty.

### 5.17.2.20 enum telux::loc::LocationInfoExValidityType

Specify the valid fields in LocationInfoExValidityType. User should determine whether a field in LocationInfoExValidityType is valid or not by checking the corresponding bit is set or not.

#### Enumerator

- HAS\_ALTITUDE\_MEAN\_SEA\_LEVEL** valid altitude mean sea level
- HAS\_DOP** valid pdop, hdop, and vdop
- HAS\_MAGNETIC\_DEVIATION** valid magnetic deviation
- HAS\_HOR\_RELIABILITY** valid horizontal reliability
- HAS\_VER\_RELIABILITY** valid vertical reliability
- HAS\_HOR\_ACCURACY\_ELIP\_SEMI\_MAJOR** valid ellipsoid semi major
- HAS\_HOR\_ACCURACY\_ELIP\_SEMI\_MINOR** valid ellipsoid semi minor
- HAS\_HOR\_ACCURACY\_ELIP\_AZIMUTH** valid accuracy ellipsoid azimuth
- HAS\_GNSS\_SV\_USED\_DATA** valid gnss sv used in pos data
- HAS\_NAV\_SOLUTION\_MASK** valid navSolutionMask
- HAS\_POS\_TECH\_MASK** valid LocPosTechMask
- HAS\_SV\_SOURCE\_INFO** valid LocSvInfoSource
- HAS\_POS\_DYNAMICS\_DATA** valid position dynamics data

**HAS\_EXT\_DOP** valid gdop, tdop  
**HAS\_NORTH\_STD\_DEV** valid North standard deviation  
**HAS\_EAST\_STD\_DEV** valid East standard deviation  
**HAS\_NORTH\_VEL** valid North Velocity  
**HAS\_EAST\_VEL** valid East Velocity  
**HAS\_UP\_VEL** valid Up Velocity  
**HAS\_NORTH\_VEL\_UNC** valid North Velocity Uncertainty  
**HAS\_EAST\_VEL\_UNC** valid East Velocity Uncertainty  
**HAS\_UP\_VEL\_UNC** valid Up Velocity Uncertainty  
**HAS\_LEAP\_SECONDS** valid leap\_seconds  
**HAS\_TIME\_UNC** valid timeUncMs  
**HAS\_NUM\_SV\_USED\_IN\_POSITION** valid number of sv used  
**HAS\_CALIBRATION\_CONFIDENCE\_PERCENT** valid sensor calibrationConfidencePercent  
**HAS\_CALIBRATION\_STATUS** valid sensor calibrationConfidence  
**HAS\_OUTPUT\_ENG\_TYPE** valid output engine type  
**HAS\_OUTPUT\_ENG\_MASK** valid output engine mask  
**HAS\_CONFORMITY\_INDEX\_FIX** valid conformity index  
**HAS\_LLA\_VRP\_BASED** valid lla vrp based  
**HAS\_ENU\_VELOCITY\_VRP\_BASED** valid enu velocity vrp based  
**HAS\_ALTITUDE\_TYPE** valid altitude type  
**HAS\_REPORT\_STATUS** valid report status  
**HAS\_INTEGRITY\_RISK\_USED** valid integrity risk  
**HAS\_PROTECT\_LEVEL\_ALONG\_TRACK** valid protect level along track  
**HAS\_PROTECT\_LEVEL\_CROSS\_TRACK** valid protect level cross track  
**HAS\_PROTECT\_LEVEL\_VERTICAL** valid protect level vertical  
**HAS\_DGNSS\_STATION\_ID** valid dgnsStationId

### 5.17.2.21 enum telux::loc::GnssDataSignalTypes

Specify the GNSS signal type and RF band for jammer info and automatic gain control metric in [GnssData](#).

#### Enumerator

**GNSS\_DATA\_SIGNAL\_TYPE\_GPS\_L1CA** GPS L1CA RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GPS\_L1C** GPS L1C RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GPS\_L2C\_L** GPS L2C\_L RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GPS\_L5\_Q** GPS L5\_Q RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GLONASS\_G1** GLONASS G1 (L1OF) RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GLONASS\_G2** GLONASS G2 (L2OF) RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GALILEO\_E1\_C** GALILEO E1\_C RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GALILEO\_E5A\_Q** GALILEO E5A\_Q RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_GALILEO\_E5B\_Q** GALILEO E5B\_Q RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_BEIDOU\_B1\_I** BEIDOU B1\_I RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_BEIDOU\_B1C** BEIDOU B1C RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_BEIDOU\_B2\_I** BEIDOU B2\_I RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_BEIDOU\_B2A\_I** BEIDOU B2A\_I RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_QZSS\_L1CA** QZSS L1CA RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_QZSS\_L1S** QZSS L1S RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_QZSS\_L2C\_L** QZSS L2C\_L RF Band.  
**GNSS\_DATA\_SIGNAL\_TYPE\_QZSS\_L5\_Q** QZSS L5\_Q RF Band.

**GNSS\_DATA\_SIGNAL\_TYPE\_SBAS\_L1\_CA** SBAS L1\_CA RF Band.

**GNSS\_DATA\_SIGNAL\_TYPE\_NAVIC\_L5** NAVIC L5 RF Band.

**GNSS\_DATA\_SIGNAL\_TYPE\_BEIDOU\_B2A\_Q** BEIDOU B2A\_Q RF Band. Maximum number of signal types.

**GNSS\_DATA\_MAX\_NUMBER\_OF\_SIGNAL\_TYPES**

### 5.17.2.22 enum telux::loc::GnssDataValidityType

Specify valid mask of data fields in [GnssData](#).

#### Enumerator

**HAS\_JAMMER** Jammer Indicator is available

**HAS\_AGC** AGC is available

### 5.17.2.23 enum telux::loc::DrCalibrationStatusType

Specify the sensor calibration status in [ILocationInfoEx](#).

#### Enumerator

**DR\_ROLL\_CALIBRATION\_NEEDED** Indicate that roll calibration is needed. Need to take more turns on level ground.

**DR\_PITCH\_CALIBRATION\_NEEDED** Indicate that pitch calibration is needed. Need to take more turns on level ground.

**DR\_YAW\_CALIBRATION\_NEEDED** Indicate that yaw calibration is needed. Need to accelerate in a straight line.

**DR\_ODO\_CALIBRATION\_NEEDED** Indicate that odo calibration is needed. Need to accelerate in a straight line.

**DR\_GYRO\_CALIBRATION\_NEEDED** Indicate that gyro calibration is needed. Need to take more turns on level ground.

### 5.17.2.24 enum telux::loc::LocReqEngineType

Specifies the set of engines whose position reports are requested via `startDetailedEngineReports`.

#### Enumerator

**LOC\_REQ\_ENGINE\_FUSED\_BIT** Indicate that the fused/default position is needed to be reported back for the tracking sessions. The default position is the propagated/aggregated reports from all engines running on the system (e.g.: DR/SPE/PPE) according to QTI algorithm.

**LOC\_REQ\_ENGINE\_SPE\_BIT** Indicate that the unmodified SPE position is needed to be reported back for the tracking sessions.

**LOC\_REQ\_ENGINE\_PPE\_BIT** Indicate that the unmodified PPE position is needed to be reported back for the tracking sessions.

**LOC\_REQ\_ENGINE\_VPE\_BIT** Indicate that the unmodified VPE position is needed to be reported back for the tracking sessions.

### 5.17.2.25 enum telux::loc::LocationAggregationType

Specifies the type of engine for the reported fixes

#### Enumerator

**LOC\_OUTPUT\_ENGINE\_FUSED** This is the propagated/aggregated report from the fixes of all engines running on the system (e.g.: DR/SPE/PPE).

**LOC\_OUTPUT\_ENGINE\_SPE** This fix is the unmodified fix from modem GNSS engine

**LOC\_OUTPUT\_ENGINE\_PPE** This is the unmodified fix from PPP engine

**LOC\_OUTPUT\_ENGINE\_VPE** This is the unmodified fix from VPE engine.

### 5.17.2.26 enum telux::loc::PositioningEngineType

Specifies the type of engine responsible for fixes when the engine type is fused

#### Enumerator

**STANDARD\_POSITIONING\_ENGINE** For standard GNSS position engines.

**DEAD\_RECKONING\_ENGINE** For dead reckoning position engines.

**PRECISE\_POSITIONING\_ENGINE** For precise position engines.

**VP\_POSITIONING\_ENGINE** For VP position engine.

### 5.17.2.27 enum telux::loc::LeverArmType

Lever ARM type

#### Enumerator

**LEVER\_ARM\_TYPE\_GNSS\_TO\_VRP** Lever arm parameters regarding the VRP (Vehicle Reference Point) w.r.t the origin (at the GNSS Antenna)

**LEVER\_ARM\_TYPE\_DR\_IMU\_TO\_GNSS** Lever arm regarding GNSS Antenna w.r.t the origin at the IMU (inertial measurement unit) for DR (dead reckoning engine)

**LEVER\_ARM\_TYPE\_VEPP\_IMU\_TO\_GNSS** Lever arm regarding GNSS Antenna w.r.t the origin at the IMU (inertial measurement unit) for VEPP (vision enhanced precise positioning engine)

**Deprecated** enum type is not supported.

**LEVER\_ARM\_TYPE\_VPE\_IMU\_TO\_GNSS** Lever arm regarding GNSS Antenna w.r.t the origin at the IMU (inertial measurement unit) for VPE (vision positioning engine)

### 5.17.2.28 enum telux::loc::GnssMeasurementsDataValidityType

Specify valid fields in [GnssMeasurementsData](#).

#### Enumerator

**SV\_ID\_BIT** Validity of svId.

**SV\_TYPE\_BIT** Validity of svType.

**STATE\_BIT** Validity of stateMask.

**RECEIVED\_SV\_TIME\_BIT** Validity of receivedSvTimeNs and receivedSvTimeSubNs.

**RECEIVED\_SV\_TIME\_UNCERTAINTY\_BIT** Validity of receivedSvTimeUncertaintyNs.

**CARRIER\_TO\_NOISE\_BIT** Validity of carrierToNoiseDbHz.

**PSEUDORANGE\_RATE\_BIT** Validity of pseudorangeRateMps.  
**PSEUDORANGE\_RATE\_UNCERTAINTY\_BIT** Validity of pseudorangeRateUncertaintyMps.  
**ADR\_STATE\_BIT** Validity of adrStateMask.  
**ADR\_BIT** Validity of adrMeters.  
**ADR\_UNCERTAINTY\_BIT** Validity of adrUncertaintyMeters.  
**CARRIER\_FREQUENCY\_BIT** Validity of carrierFrequencyHz.  
**CARRIER\_CYCLES\_BIT** Validity of carrierCycles.  
**CARRIER\_PHASE\_BIT** Validity of carrierPhase.  
**CARRIER\_PHASE\_UNCERTAINTY\_BIT** Validity of carrierPhaseUncertainty.  
**MULTIPATH\_INDICATOR\_BIT** Validity of multipathIndicator.  
**SIGNAL\_TO\_NOISE\_RATIO\_BIT** Validity of signalToNoiseRatioDb.  
**AUTOMATIC\_GAIN\_CONTROL\_BIT** Validity of agcLevelDb.  
**GNSS\_SIGNAL\_TYPE** Validity of signal type.  
**BASEBAND\_CARRIER\_TO\_NOISE** Validity of basebandCarrierToNoise.  
**FULL\_ISB** Validity of fullInterSignalBias.  
**FULL\_ISB\_UNCERTAINTY** Validity of fullInterSignalBiasUncertainty.

### 5.17.2.29 enum telux::loc::GnssMeasurementsStateValidityType

Specify GNSS measurement state in [GnssMeasurementsData::stateMask](#).

#### Enumerator

**UNKNOWN\_BIT** State is unknown.  
**CODE\_LOCK\_BIT** State is "code lock".  
**BIT\_SYNC\_BIT** State is "bit sync".  
**SUBFRAME\_SYNC\_BIT** State is "subframe sync".  
**TOW\_DECODED\_BIT** State is "tow decoded".  
**MSEC\_AMBIGUOUS\_BIT** State is "msec ambiguous".  
**SYMBOL\_SYNC\_BIT** State is "symbol sync".  
**GLO\_STRING\_SYNC\_BIT** State is "GLONASS string sync".  
**GLO\_TOD\_DECODED\_BIT** State is "GLONASS TOD decoded".  
**BDS\_D2\_BIT\_SYNC\_BIT** State is "BDS D2 bit sync".  
**BDS\_D2\_SUBFRAME\_SYNC\_BIT** State is "BDS D2 subframe sync".  
**GAL\_E1BC\_CODE\_LOCK\_BIT** State is "Galileo E1BC code lock".  
**GAL\_E1C\_2ND\_CODE\_LOCK\_BIT** State is "Galileo E1C second code lock".  
**GAL\_E1B\_PAGE\_SYNC\_BIT** State is "Galileo E1B page sync".  
**SBAS\_SYNC\_BIT** State is "SBAS sync".

### 5.17.2.30 enum telux::loc::GnssMeasurementsAdrStateValidityType

Specify accumulated delta range state in [GnssMeasurementsData::adrStateMask](#).

#### Enumerator

**UNKNOWN\_STATE** State is unknown.  
**VALID\_BIT** State is valid.  
**RESET\_BIT** State is "reset".  
**CYCLE\_SLIP\_BIT** State is "cycle slip".

### 5.17.2.31 enum telux::loc::GnssMeasurementsMultipathIndicator

Specify the GNSS multipath indicator state in [GnssMeasurementsData::multipathIndicator](#).

#### Enumerator

**UNKNOWN\_INDICATOR** Multipath indicator is unknown.

**PRESENT** Multipath indicator is present.

**NOT\_PRESENT** Multipath indicator is not present.

### 5.17.2.32 enum telux::loc::GnssMeasurementsClockValidityType

Specify the valid fields in [GnssMeasurementsClock](#).

#### Enumerator

**LEAP\_SECOND\_BIT** Validity of leapSecond.

**TIME\_BIT** Validity of timeNs.

**TIME\_UNCERTAINTY\_BIT** Validity of timeUncertaintyNs.

**FULL\_BIAS\_BIT** Validity of fullBiasNs.

**BIAS\_BIT** Validity of biasNs.

**BIAS\_UNCERTAINTY\_BIT** Validity of biasUncertaintyNs.

**DRIFT\_BIT** Validity of driftNsps.

**DRIFT\_UNCERTAINTY\_BIT** Validity of driftUncertaintyNsps.

**HW\_CLOCK\_DISCONTINUITY\_COUNT\_BIT** Validity of hwClockDiscontinuityCount.

### 5.17.2.33 enum telux::loc::LeapSecondInfoValidityType

Specify the valid fields in [LeapSecondInfo](#).

#### Enumerator

**LEAP\_SECOND\_SYS\_INFO\_CURRENT\_LEAP\_SECONDS\_BIT** Validity of [LeapSecondInfo::current](#).

**LEAP\_SECOND\_SYS\_INFO\_LEAP\_SECOND\_CHANGE\_BIT** Validity of [LeapSecondInfo::info](#).

### 5.17.2.34 enum telux::loc::LocationSystemInfoValidityType

Specify the set of valid fields in [LocationSystemInfo](#)

#### Enumerator

**LOCATION\_SYS\_INFO\_LEAP\_SECOND** contains current leap second or leap second change info

### 5.17.2.35 enum telux::loc::GnssEnergyConsumedInfoValidityType

Specify the valid fields in [GnssEnergyConsumedInfo](#).

#### Enumerator

**ENERGY\_CONSUMED\_SINCE\_FIRST\_BOOT\_BIT** validity of [GnssEnergyConsumedInfo](#)

### 5.17.2.36 enum telux::loc::AidingDataType

Specifies the set of aiding data. This is referenced in the deleteAidingData for deleting any aiding data.

#### Enumerator

**AIDING\_DATA\_EPHEMERIS** Mask to delete ephemeris aiding data

**AIDING\_DATA\_DR\_SENSOR\_CALIBRATION** Mask to delete calibration data from dead reckoning position engine

### 5.17.2.37 enum telux::loc::TerrestrialTechnologyType

Specifies the set of terrestrial technologies.

#### Enumerator

**GTP\_WWAN** Cell-based technology

### 5.17.2.38 enum telux::loc::NmeaSentenceType

Specifies the HLOS generated NMEA sentence types.

#### Enumerator

**GGA** GGA NMEA sentence

**RMC** RMC NMEA sentence

**GSA** GSA NMEA sentence

**VTG** VTG NMEA sentence

**GNS** GNS NMEA sentence

**DTM** DTM NMEA sentence

**GPGSV** GPGSV NMEA sentence for SVs from GPS constellation

**GLGSV** GLGSV NMEA sentence for SVs from GLONASS constellation

**GAGSV** GAGSV NMEA sentence for SVs from GALILEO constellation

**GQGSV** GQGSV NMEA sentence for SVs from QZSS constellation

**GBGSV** GBGSV NMEA sentence for SVs from BEIDOU constellation

**GIGSV** GIGSV NMEA sentence for SVs from NAVIC constellation

**ALL** All NMEA sentences

### 5.17.2.39 enum telux::loc::GeodeticDatumType [strong]

Specify the Geodetic datum for NMEA sentence types that are generated.

#### Enumerator

**GEODETIC\_TYPE\_NONE** No type

**GEODETIC\_TYPE\_WGS\_84** Geodetic datum type to indicate the use of World Geodetic System 1984 (WGS84) system

**GEODETIC\_TYPE\_PZ\_90** Geodetic datum type to indicate the use of PZ90/GLONASS system

### 5.17.2.40 enum telux::loc::RobustLocationConfigType

Specify the valid mask for robust location configuration used by the GNSS standard position engine (SPE).

#### Enumerator

**VALID\_ENABLED** Validity of enabled  
**VALID\_ENABLED\_FOR\_E911** Validity of enabledForE911.  
**VALID\_VERSION** Validity of version.

### 5.17.2.41 enum telux::loc::DRConfigValidityType

Specify the valid mask for the configuration parameters of dead reckoning position engine

#### Enumerator

**BODY\_TO\_SENSOR\_MOUNT\_PARAMS\_VALID** Validity of body to sensor mount parameters.  
**VEHICLE\_SPEED\_SCALE\_FACTOR\_VALID** Validity of vehicle speed scale factor.  
**VEHICLE\_SPEED\_SCALE\_FACTOR\_UNC\_VALID** Validity of vehicle speed scale factor uncertainty.  
**GYRO\_SCALE\_FACTOR\_VALID** Validity of gyro scale factor.  
**GYRO\_SCALE\_FACTOR\_UNC\_VALID** Validity of gyro scale factor uncertainty.

### 5.17.2.42 enum telux::loc::GnssReportType

Specifies the set of gnss reports.

#### Enumerator

**LOCATION** Location reports  
**SATELLITE\_VEHICLE** Satellite reports  
**NMEA** Nmea reports  
**DATA** Data reports  
**MEASUREMENT** Low rate measurement reports. Currently the rate is defined to be 1 Hz.  
**HIGH\_RATE\_MEASUREMENT** High rate measurement reports. Currently the rate is defined to be 10 Hz. Client cannot specify rates. The data in high rate would be different that from low rate. Also there might be difference in accuracy of fields for the both the rates.

### 5.17.2.43 enum telux::loc::EngineType [strong]

Specify the position engine types

#### Enumerator

**UNKNOWN** Unknown engine type.  
**SPE** Standard GNSS position engine.  
**PPE** Precise position engine.  
**DRE** Dead reckoning position engine.  
**VPE** Vision positioning engine.

### 5.17.2.44 enum telux::loc::LocationEngineRunState [strong]

Specify the position engine run state

#### Enumerator

**UNKNOWN** Unknown engine run state.

**SUSPENDED** Request the position engine to be put into suspended state. When put in this state the QDR engine will discard calibration data.

**RUNNING** Request the position engine to be put into running state.

**SUSPEND\_RETAIN** Request the position engine to be put into suspend state while retaining any calibration data. While configuring this engine state via [ILocationConfigurator::configure←EngineState](#), the vehicle is expected to be stationary and should be set to **RUNNING** before the vehicle is expected to move(for example,on Ignition On). This state is applicable when the client expects QDR to retain necessary data for subsequent resume/reboot while being suspended.

### 5.17.2.45 enum telux::loc::ReportStatus [strong]

Specify the status of the report

#### Enumerator

**UNKNOWN** Report status is unknown.

**SUCCESS** Report status is successful. The engine is able to calculate the desired fix. Most of the fields in [ILocationInfoEx](#) will be valid.

**INTERMEDIATE** Report is still in progress. The engine has not completed its calculations when this report was generated. Accuracy of various fields is non-optimal. Only some of the fields in [ILocationInfoEx](#) will be valid.

**FAILURE** Report status has failed. The engine is not able to calculate the fix. Most of the fields in [ILocationInfoEx](#) will be invalid.

### 5.17.2.46 enum telux::loc::DebugLogLevel [strong]

Specify the logcat debug level during XTRA's param configuration. Currently, only XTRA daemon will support the runtime configuration of the debug log level.

#### Enumerator

**DEBUG\_LOG\_LEVEL\_NONE** No message is logged.

**DEBUG\_LOG\_LEVEL\_ERROR** Only error level debug messages will get logged.

**DEBUG\_LOG\_LEVEL\_WARNING** Only warning and error level debug messages will get logged.

**DEBUG\_LOG\_LEVEL\_INFO** Only info, warning and error level debug messages will get logged.

**DEBUG\_LOG\_LEVEL\_DEBUG** Only debug, info, warning and error level debug messages will get logged.

**DEBUG\_LOG\_LEVEL\_VERBOSE** Verbose, debug, info, warning and error level debug messages will get logged.

### 5.17.2.47 enum telux::loc::XtraDataStatus [strong]

Provides the status of the previously downloaded Xtra data.

**Enumerator**

**STATUS\_UNKNOWN** If XTRA feature is disabled or if XTRA feature is enabled, but XTRA daemon has not yet retrieved the assistance data status from modem on early stage of device bootup, xtra data status will be unknown.

**STATUS\_NOT\_AVAIL** If XTRA feature is enabled, but XTRA data is not present on the device.

**STATUS\_NOT\_VALID** If XTRA feature is enabled, XTRA data has been downloaded ever but no longer valid.

**STATUS\_VALID** If XTRA feature is enabled, XTRA data has been downloaded and is currently valid.

**5.17.2.48 enum telux::loc::LocConfigIndicationsType**

Enum of all the possible indications invoked by a Location Configurator listener.

**Enumerator**

**LOC\_CONF\_IND\_XTRA\_STATUS**

**5.17.3 Variable Documentation**

**5.17.3.1 const float telux::loc::UNKNOWN\_CARRIER\_FREQ = -1**

**5.17.3.2 const int telux::loc::UNKNOWN\_SIGNAL\_MASK = 0**

**5.17.3.3 const double telux::loc::UNKNOWN\_BASEBAND\_CARRIER\_NOISE = 0.0**

**5.17.3.4 const uint64\_t telux::loc::UNKNOWN\_TIMESTAMP = 0**

**5.17.3.5 const float telux::loc::DEFAULT\_TUNC\_THRESHOLD = 0.0**

Default value for threshold of time uncertainty. Units: milli-seconds.

**5.17.3.6 const int telux::loc::DEFAULT\_TUNC\_ENERGY\_THRESHOLD = 0**

Default value for energy consumed of time uncertainty. The default here means that the engine is allowed to use infinite power. Units: 100 micro watt second.

**5.17.3.7 const uint64\_t telux::loc::INVALID\_ENERGY\_CONSUMED = 0xffffffffffffff**

0xffffffffffffff indicates an invalid reading for energy consumed info.

**5.17.3.8 const uint32\_t telux::loc::DEFAULT\_GNSS\_REPORT = 0xffffffff**

0xffffffff indicates all the reports are enabled.

## 5.18 common

This section contains APIs related to Logger, Command Callbacks, Error Codes and [Version](#) information. Also contains Macros to print message at different log level.

### 5.18.1 Data Structure Documentation

#### 5.18.1.1 class telux::common::ICommandCallback

Base command callback class is responsible for single shot asynchronous callback. This callback will be invoked only once when the operation succeeds or fails.

##### Public member functions

- virtual [~ICommandCallback](#) ()

##### 5.18.1.1.1 Constructors and Destructors

5.18.1.1.1 virtual telux::common::ICommandCallback::~ICommandCallback ( ) [virtual]

#### 5.18.1.2 class telux::common::ICommandResponseCallback

General command response callback for most of the requests, client needs to implement this interface to get single shot response.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

##### Public member functions

- virtual void [commandResponse](#) (ErrorCode error)=0
- virtual [~ICommandResponseCallback](#) ()

##### 5.18.1.2.1 Constructors and Destructors

5.18.1.2.1 virtual telux::common::ICommandResponseCallback::~ICommandResponseCallback ( ) [virtual]

##### 5.18.1.2.2 Member Function Documentation

5.18.1.2.2.1 virtual void telux::common::ICommandResponseCallback::commandResponse ( ErrorCode *error* ) [pure virtual]

This function is called with the response to the command operation.

##### Parameters

in	<i>error</i>	- <a href="#">ErrorCode</a>
----	--------------	-----------------------------

### 5.18.1.3 class telux::common::DeviceConfig

#### Static Public Member Functions

- static bool [isMultiSimSupported](#) ()

#### 5.18.1.3.1 Member Function Documentation

##### 5.18.1.3.1.1 static bool telux::common::DeviceConfig::isMultiSimSupported ( ) [static]

Check whether multi SIM support available.

#### Returns

bool to determine multi SIM support

### 5.18.1.4 class telux::common::Log

#### Static Public Member Functions

- template<typename... MessageArgs>  
static void [logMessage](#) ([LogLevel](#) logLevel, const std::string &fileName, const std::string &lineNo, const int &component, MessageArgs...params)

#### 5.18.1.4.1 Member Function Documentation

##### 5.18.1.4.1.1 template<typename... MessageArgs> static void telux::common::Log::logMessage ( [LogLevel](#) *logLevel*, const std::string & *fileName*, const std::string & *lineNo*, const int & *component*, MessageArgs... *params* ) [static]

### 5.18.1.5 struct telux::common::SdkVersion

Structure of major, minor and patch version

#### Data fields

Type	Field	Description
int	major	Major <a href="#">Version</a> : This number will be incremented whenever significant changes or features are introduced
int	minor	Minor <a href="#">Version</a> : This number will be incremented when smaller features with some new APIs are introduced.
int	patch	Patch <a href="#">Version</a> : If the release only contains bug fixes, but no API change then the patch version would be incremented.

### 5.18.1.6 class telux::common::Version

Provides version of SDK.

## Static Public Member Functions

- static std::string [getReleaseName](#) ()
- static [SdkVersion](#) [getSdkVersion](#) ()

### 5.18.1.6.1 Member Function Documentation

#### 5.18.1.6.1.1 static std::string telux::common::Version::getReleaseName ( ) [static]

Get the release name.

#### Returns

String contains release name

#### 5.18.1.6.1.2 static SdkVersion telux::common::Version::getSdkVersion ( ) [static]

Get the Telematics SDK version, for example: 01.00.00

#### Returns

[SdkVersion](#) structure of major, minor and patch version

## 5.18.2 Enumeration Type Documentation

### 5.18.2.1 enum telux::common::Status [strong]

Defines all the status codes that all Telematics SDK APIs can return

#### Enumerator

**SUCCESS** API processing is successful, returned parameters are valid

**FAILED** API processing failure.

**NOCONNECTION** Connection to Socket server has not been established

**NOSUBSCRIPTION** Subscription not available

**INVALIDPARAM** Input parameters are invalid

**INVALIDSTATE** Invalid State

**NOTREADY** Subsystem is not ready

**NOTALLOWED** Operation not allowed

**NOTIMPLEMENTED** Functionality not implemented

**CONNECTIONLOST** Connection to Socket server lost

**EXPIRED** Expired

**ALREADY** Already registered handler

**NOSUCH** No such object

**NOTSUPPORTED** Not supported on target platform

**NOMEMORY** Not sufficient memory to process the request

### 5.18.2.2 enum telux::common::ErrorCode [strong]

Generic Error code for each API responses

#### Enumerator

**SUCCESS** No error

**RADIO\_NOT\_AVAILABLE** If radio did not start or is resetting

**GENERIC\_FAILURE** Generic Failure

**PASSWORD\_INCORRECT** For PIN/PIN2 methods only

**SIM\_PIN2** Operation requires SIM PIN2 to be entered

**SIM\_PUK2** Operation requires SIM PIN2 to be entered

**REQUEST\_NOT\_SUPPORTED** Not Supported request

**CANCELLED** Cancelled

**OP\_NOT\_ALLOWED\_DURING\_VOICE\_CALL** Data operation are not allowed during voice call on a Class C GPRS device

**OP\_NOT\_ALLOWED\_BEFORE\_REG\_TO\_NW** Data operation are not allowed before device registers in network

**SMS\_SEND\_FAIL\_RETRY** Fail to send SMS and need retry

**SIM\_ABSENT** Fail to set the location where CDMA subscription shall be retrieved because of SIM or RUIM are absent

**SUBSCRIPTION\_NOT\_AVAILABLE** Fail to find CDMA subscription from specified location

**MODE\_NOT\_SUPPORTED** Hardware does not support preferred network type

**FDN\_CHECK\_FAILURE** Command failed because recipient is not on FDN list

**ILLEGAL\_SIM\_OR\_ME** Network selection failed due to illegal SIM or ME

**MISSING\_RESOURCE** No logical channel available

**NO\_SUCH\_ELEMENT** Application not found on SIM

**DIAL\_MODIFIED\_TO USSD** DIAL request modified to USSD

**DIAL\_MODIFIED\_TO\_SS** DIAL request modified to SS

**DIAL\_MODIFIED\_TO\_DIAL** DIAL request modified to DIAL with different data

**USSD\_MODIFIED\_TO\_DIAL** USSD request modified to DIAL

**USSD\_MODIFIED\_TO\_SS** USSD request modified to SS

**USSD\_MODIFIED\_TO\_USSD** USSD request modified to different USSD request

**SS\_MODIFIED\_TO\_DIAL** SS request modified to DIAL

**SS\_MODIFIED\_TO\_USSD** SS request modified to USSD

**SUBSCRIPTION\_NOT\_SUPPORTED** Subscription not supported

**SS\_MODIFIED\_TO\_SS** SS request modified to different SS request

**LCE\_NOT\_SUPPORTED** LCE service not supported

**NO\_MEMORY** Not sufficient memory to process the request

**INTERNAL\_ERR** Hit unexpected vendor internal error scenario

**SYSTEM\_ERR** Hit platform or system error

**MODEM\_ERR** Hit unexpected modem error

**INVALID\_STATE** Unexpected request for the current state

**NO\_RESOURCES** Not sufficient resource to process the request

**SIM\_ERR** Received error from SIM card

**INVALID\_ARGUMENTS** Received invalid arguments in request

**INVALID\_SIM\_STATE** Cannot process the request in current SIM state

**INVALID\_MODEM\_STATE** Cannot process the request in current Modem state

**INVALID\_CALL\_ID** Received invalid call id in request

**NO\_SMS\_TO\_ACK** ACK received when there is no SMS to ack

**NETWORK\_ERR** Received error from network

**REQUEST\_RATE\_LIMITED** Operation denied due to overly-frequent requests

**SIM\_BUSY** SIM is busy

**SIM\_FULL** The target EF is full

**NETWORK\_REJECT** Request is rejected by network

**OPERATION\_NOT\_ALLOWED** Not allowed the request now

**EMPTY\_RECORD** The request record is empty

**INVALID\_SMS\_FORMAT** Invalid SMS format

**ENCODING\_ERR** Message not encoded properly

**INVALID\_SMSC\_ADDRESS** SMSC address specified is invalid

**NO\_SUCH\_ENTRY** No such entry present to perform the request

**NETWORK\_NOT\_READY** Network is not ready to perform the request

**NOT\_PROVISIONED** Device does not have this value provisioned

**NO\_SUBSCRIPTION** Device does not have subscription

**NO\_NETWORK\_FOUND** Network cannot be found

**DEVICE\_IN\_USE** Operation cannot be performed because the device is currently in use

**ABORTED** Operation aborted

**INCOMPATIBLE\_STATE** Operation cannot be performed because the device is in incompatible state

**NO\_EFFECT** Given request had to no effect

**DEVICE\_NOT\_READY** Device not ready

**MISSING\_ARGUMENTS** Missing one or more arguments

**PIN\_PERM\_BLOCKED** PIN is permanently blocked. The SIM is unusable.

**PIN\_BLOCKED** PIN is blocked. Unblock operation must be issued.

**MALFORMED\_MSG** Message was not formulated correctly by the control point or the message was corrupted during transmission

**INTERNAL** Internal error

**CLIENT\_IDS\_EXHAUSTED** Client IDs exhausted

**UNABORTABLE\_TRANSACTION** The specified transaction could not be aborted

**INVALID\_CLIENT\_ID** Could not find client's request

**NO\_THRESHOLDS** No thresholds specified in enable signal strength

**INVALID\_HANDLE** Invalid client handle was received

**INVALID\_PROFILE** Invalid profile index specified

**INVALID\_PINID** PIN in the request is invalid.

**INCORRECT\_PIN** PIN in the request is incorrect.

**CALL\_FAILED** Call origination failed in the lower layers

**OUT\_OF\_CALL** Request issued when packet data session disconnected

**MISSING\_ARG** TLV was missing in the request.

**ARG\_TOO\_LONG** Path in the request was too long.

**INVALID\_TX\_ID** The transaction ID supplied in the request does not match any pending transaction  
i.e. either the transaction was not received or it is already executed by the device

**OP\_NETWORK\_UNSUPPORTED** Selected operation is not supported by the network

**OP\_DEVICE\_UNSUPPORTED** Operation is not supported by device or SIM card

**NO\_FREE\_PROFILE** Maximum number of profiles are stored in the device and there is no more storage available to create a new profile

**INVALID\_PDP\_TYPE** PDP type specified is not supported

**INVALID\_TECH\_PREF** Invalid technology preference

**INVALID\_PROFILE\_TYPE** Invalid profile type is specified

**INVALID\_SERVICE\_TYPE** Invalid service type

**INVALID\_REGISTER\_ACTION** Invalid register action value specified in request

**INVALID\_PS\_ATTACH\_ACTION** Invalid PS attach action value specified in request

**AUTHENTICATION\_FAILED** Authentication error.

**SIM\_NOT\_INITIALIZED** PIN is not yet initialized because the SIM initialization has not finished. Try the PIN operation later.

**MAX\_QOS\_REQUESTS\_IN\_USE** Maximum QoS requests in use

**INCORRECT\_FLOW\_FILTER** Incorrect flow filter

**NETWORK\_QOS\_UNAWARE** Network QoS unaware

**INVALID\_ID** Invalid call ID was sent in the request

**REQUESTED\_NUM\_UNSUPPORTED** Requested message ID is not supported by the currently running software

**INTERFACE\_NOT\_FOUND** Cannot retrieve the FMC interface

**FLOW\_SUSPENDED** Flow suspended

**INVALID\_DATA\_FORMAT** Invalid data format

**GENERAL** General error

**UNKNOWN** Unknown error

**INVALID\_ARG** Parameters passed as input were invalid

**INVALID\_INDEX** MIP profile index is not within the valid range

**NO\_ENTRY** No message exists at the specified memory storage designation

**DEVICE\_STORAGE\_FULL** Memory storage specified in the request is full

**CAUSE\_CODE** There was an error in the request

**MESSAGE\_NOT\_SENT** Message could not be sent

**MESSAGE\_DELIVERY\_FAILURE** Message could not be delivered

**INVALID\_MESSAGE\_ID** Message ID specified for the message is invalid

**ENCODING** Message is not encoded properly

**AUTHENTICATION\_LOCK** Maximum number of authentication failures has been reached

**INVALID\_TRANSITION** Selected operating mode transition from the current operating mode is invalid

**NOT\_A\_MCAST\_IFACE** Not a MCAST interface

**MAX\_MCAST\_REQUESTS\_IN\_USE** MCAST request in use

**INVALID\_MCAST\_HANDLE** An invalid MCAST handle

**INVALID\_IP\_FAMILY\_PREF** IP family preference is invalid

**SESSION\_INACTIVE** Session inactive

**SESSION\_INVALID** Session not valid

**SESSION\_OWNERSHIP** Session ownership error

**INSUFFICIENT\_RESOURCES** Response is longer than the maximum supported size

**DISABLED** Disabled

**INVALID\_OPERATION** Device is not expecting the request.

**INVALID\_QMI\_CMD** Invalid QMI command

**TPDU\_TYPE** Message in memory contains a TPDU type that cannot be read

**SMSC\_ADDR** SMSC address specified is invalid

**INFO\_UNAVAILABLE** Information is not available

**SEGMENT\_TOO\_LONG** PRL segment size is too large

**SEGMENT\_ORDER** PRL segment order is incorrect

**BUNDLING\_NOT\_SUPPORTED** Bundling not supported

**OP\_PARTIAL\_FAILURE** Some personalization codes were set but an error prevented

**POLICY\_MISMATCH** Network policy does not match a valid NAT

**SIM\_FILE\_NOT\_FOUND** File is not present on the card.

**EXTENDED\_INTERNAL** Error from the the DS profile module, the extended error

**ACCESS\_DENIED** Access to the requested file is denied. This can occur when there is an attempt to access a PIN-protected file.

**HARDWARE\_RESTRICTED** Selected operating mode is invalid with the current wireless disable setting

**ACK\_NOT\_SENT** ACK could not be sent

**INJECT\_TIMEOUT** Inject timeout

**FDN\_RESTRICT** FDN restriction

**SUPS\_FAILURE\_CAUSE** Indicates supplementary services failure information;

**NO\_RADIO** Radio is not available

**NOT\_SUPPORTED** Operation is not supported

**CARD\_CALL\_CONTROL\_FAILED** SIM/R-UIM call control failed

**NETWORK\_ABORTED** Operation was released abruptly by the network

**MSG\_BLOCKED** Message blocked

**INVALID\_SESSION\_TYPE** Invalid session type

**INVALID\_PB\_TYPE** Invalid Phone Book type

**NO\_SIM** Action is being performed on a SIM that is not initialized.

**PB\_NOT\_READY** Phone Book not ready

**PIN\_RESTRICTION** PIN restriction

**PIN2\_RESTRICTION** PIN2 restriction

**PUK\_RESTRICTION** PUK restriction

**PUK2\_RESTRICTION** PUK2 restriction

**PB\_ACCESS\_RESTRICTED** Phone Book access restricted

**PB\_DELETE\_IN\_PROG** Phone Book delete in progress

**PB\_TEXT\_TOO\_LONG** Phone Book text too long

**PB\_NUMBER\_TOO\_LONG** Phone Book number too long

**PB\_HIDDEN\_KEY\_RESTRICTION** Phone Book hidden key restriction

**PB\_NOT\_AVAILABLE** Phone Book not available

**DEVICE\_MEMORY\_ERROR** Device memory error

**NO\_PERMISSION** No permission

**TOO\_SOON** Too soon

**TIME\_NOT\_ACQUIRED** Time not acquired

**OP\_IN\_PROGRESS** Operation is in progress

**DS\_PROFILE\_REG\_RESULT\_FAIL** General failure

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID\_HNDL** Request contains an invalid profile handle

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID\_OP** Invalid operation was requested

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID\_PROFILE\_TYPE** Request contains an invalid technology type

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID\_PROFILE\_NUM** Request contains an invalid profile number

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID\_IDENT** Request contains an invalid profile identifier

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID** Request contains an invalid argument other than profile number and profile identifier received

**DS\_PROFILE\_REG\_RESULT\_ERR\_LIB\_NOT\_INITED** Profile registry has not been initialized yet

**DS\_PROFILE\_REG\_RESULT\_ERR\_LEN\_INVALID** Request contains a parameter with invalid length

**DS\_PROFILE\_REG\_RESULT\_LIST\_END** End of the profile list was reached while searching for the requested profile

**DS\_PROFILE\_REG\_RESULT\_ERR\_INVALID\_SUBS\_ID** Request contains an invalid subscription identifier

**DS\_PROFILE\_REG\_INVALID\_PROFILE\_FAMILY** Request contains an invalid profile family

**DS\_PROFILE\_REG\_PROFILE\_VERSION\_MISMATCH** [Version](#) mismatch

**REG\_RESULT\_ERR\_OUT\_OF\_MEMORY** Out of memory

**DS\_PROFILE\_REG\_RESULT\_ERR\_FILE\_ACCESS** File access error

**DS\_PROFILE\_REG\_RESULT\_ERR\_EOF** End of field

**REG\_RESULT\_ERR\_VALID\_FLAG\_NOT\_SET** A valid flag is not set

**REG\_RESULT\_ERR\_OUT\_OF\_PROFILES** Out of profiles  
**REG\_RESULT\_NO\_EMERGENCY\_PDN\_SUPPORT** No emergency PDN support  
**V2X\_ERR\_EXCEED\_MAX** Exceed max allowed number  
**V2X\_ERR\_V2X\_DISABLED** V2x mode was not enabled  
**V2X\_ERR\_UNKNOWN\_SERVICE\_ID** The service id unknown  
**V2X\_ERR\_SRV\_ID\_L2\_ADDRS\_NOT\_COMPATIBLE** The service Id mismatch with L2 addr  
**V2X\_ERR\_PORT\_UNAVAIL** The port was occupied by others  
**DS\_PROFILE\_3GPP\_INVALID\_PROFILE\_FAMILY** Request contains an invalid 3GPP profile family  
**DS\_PROFILE\_3GPP\_ACCESS\_ERR** Error was encountered while accessing the 3GPP profiles  
**DS\_PROFILE\_3GPP\_CONTEXT\_NOT\_DEFINED** Specified 3GPP profile does not have a valid context  
**DS\_PROFILE\_3GPP\_VALID\_FLAG\_NOT\_SET** Specified 3GPP profile is marked invalid  
**DS\_PROFILE\_3GPP\_READ\_ONLY\_FLAG\_SET** Specified 3GPP profile is marked read-only  
**DS\_PROFILE\_3GPP\_ERR\_OUT\_OF\_PROFILES** Creation of a new 3GPP profile failed because the limit of 16 profiles has already been reached  
**DS\_PROFILE\_3GPP2\_ERR\_INVALID\_IDENT\_FOR\_PROFILE** Invalid profile identifier was received as part of the 3GPP2 profile modification request  
**DS\_PROFILE\_3GPP2\_ERR\_OUT\_OF\_PROFILE** Creation of a new 3GPP2 profile failed because the limit has already been reached  
**INTERNAL\_ERROR** Internal error  
**SERVICE\_ERROR** Service error  
**TIMEOUT\_ERROR** Timeout error  
**EXTENDED\_ERROR** Extended error  
**PORT\_NOT\_OPEN\_ERROR** Port not open  
**MEMCOPY\_ERROR** Memory copy error  
**INVALID\_TRANSACTION** Invalid transaction  
**ALLOCATION\_FAILURE** Allocation failure  
**TRANSPORT\_ERROR** Transport error  
**PARAM\_ERROR** Parameter error  
**INVALID\_CLIENT** Invalid client  
**FRAMEWORK\_NOT\_READY** Framework not ready  
**INVALID\_SIGNAL** Invalid signal  
**TRANSPORT\_BUSY\_ERROR** Transport busy error  
**SUBSYSTEM\_UNAVAILABLE** Underlying service currently unavailable  
**OPERATION\_TIMEOUT** Timeout error  
**ROLLBACK\_FAILED** Rollback to initial state failed

### 5.18.2.3 enum telux::common::ServiceStatus [strong]

Service status.

#### Enumerator

**SERVICE\_UNAVAILABLE**  
**SERVICE\_AVAILABLE**  
**SERVICE\_FAILED**

#### 5.18.2.4 enum telux::common::ProcType [strong]

This applies in system architectures where the modem is attached to an External Application Processor(EAP). The operations associated with the ProcType can be performed by SDK either on EAP or the modem's Internal Application Processor(IAP). This type specifies where the operation is carried out.

##### Enumerator

**LOCAL\_PROC** Perform the operation on the processor where the API is invoked.

**REMOTE\_PROC** Perform the operation on the application processor other than where the API is invoked.

#### 5.18.2.5 enum telux::common::LogLevel [strong]

Indicates supported logging levels.

##### Enumerator

**LEVEL\_NONE**

**LEVEL\_PERF** Prints messages with nanoseconds precision timestamp

**LEVEL\_ERROR** Prints perf and error messages only

**LEVEL\_WARNING** Prints perf, error and warning messages

**LEVEL\_INFO** Prints perf, errors, warning and information messages

**LEVEL\_DEBUG** Full logging including debug messages

## 5.19 C APIs

- [C Common APIs](#)
- [C Kinematics APIs](#)
- [C Radio APIs](#)
- [C Vehicle APIs](#)
- [C Config APIs](#)
- [C Packet APIs](#)

This section contains C APIs related to Cellular-V2X operation.

## 5.20 C Common APIs

This section contains C Common APIs related to Cellular-V2X operation.

The following common typedefs and macros are used by the C-V2X C APIs.

### 5.20.1 Data Structure Documentation

#### 5.20.1.1 struct v2x\_api\_ver\_t

Contains retrieved information about the SDK API library that is called. Each SDK component (Kinematics, Radio, Vehicle Data) implements a method to return this structure.

##### Data fields

Type	Field	Description
uint32_t	version_num	Version number of the interface.
char	build_date_↔ str[128]	Date of the build (part of the data string).
char	build_time_↔ str[128]	Time of the build (part of the data string).
char	build_details↔ _str[128]	Build details (part of the data string).

### 5.20.2 Enumeration Type Documentation

#### 5.20.2.1 enum v2x\_status\_enum\_type

Valid types for subsystem status, and return status codes for API function calls and callbacks.

##### Enumerator

**V2X\_STATUS\_SUCCESS** Operation is successful.

**V2X\_STATUS\_FAIL** Operation is unsuccessful. This is a generic error failure status that can be due to radio hardware resource limitations, geofencing, and so on.

**V2X\_STATUS\_ENO\_MEMORY** Failure due to a memory allocation issue.

**V2X\_STATUS\_EBADPARAM** One of the supplied parameters is bad.

**V2X\_STATUS\_EALREADY** Attempted step was already issued, and this call is not required.

**V2X\_STATUS\_KINEMATICS\_PLACEHOLDER** Begin the return codes associated with the Kinematics interface.

**V2X\_STATUS\_RADIO\_PLACEHOLDER** Begin the return codes associated with the Radio interface.

**V2X\_STATUS\_ECHANNEL\_UNAVAILABLE** Requested radio frequency cannot be used at this time.

**V2X\_STATUS\_RADIO\_NOT\_READY** Radio initialization failed due to v2x status.

**V2X\_STATUS\_VEHICLE\_PLACEHOLDER** Begin the return codes associated with the Vehicle Data interface.

## 5.21 C Kinematics APIs

This section contains C Kinematics APIs related to Cellular-V2X operation. For any new CV2x development, it is recommended to use the C++ `telux::loc::ILocationManager` APIs.

Abstraction of the system GNSS + DR solution for returning precision fixes with low latency via callbacks. This solution is used each time a fix is available, and it supports multiple callbacks to a short list of clients.

Common types are used for the motion and location reporting system of the platform. These types include the structures that are used to both configure the Kinematics subsystem and to report periodic fixes. The fixes are combinations of inertial/motion data and GNSS solutions determined (possibly directly) from satellite processing or dead-reckoning in degraded SV reception.

### 5.21.1 Define Documentation

#### 5.21.1.1 #define V2X\_KINEMATICS\_HANDLE\_BAD (-1)

Invalid handle returned by `v2x_kinematics_init()` upon an error.

### 5.21.2 Data Structure Documentation

#### 5.21.2.1 struct v2x\_GNSSstatus\_t

Contains status information for the GNSS satellite.

This structure is used for each reported fix to indicate the quality of the available constellation (or whether the constellation is not available).

#### Data fields

Type	Field	Description
bool	unavailable	Specifies whether a constellation is not equipped or is unavailable. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – GNSS is available</li> <li>• 1 – GNSS is unavailable</li> </ul>
bool	aPDOPof↔ Under5	Specifies whether dilution of precision is greater than 5. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not greater than 5</li> <li>• 1 – Greater than 5</li> </ul>
bool	inViewOf↔ Under5	Specifies whether fewer than five satellites are in view. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Five or more satellites are in view</li> <li>• 1 – Fewer than five satellites are in view</li> </ul>
bool	local↔ Corrections↔ Present	Specifies whether DGPS type corrections are used. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not used</li> <li>• 1 – Used</li> </ul>

Type	Field	Description
bool	network↔ Corrections↔ Present	Specifies whether RTK type corrections are used.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not used</li> <li>• 1 – Used</li> </ul>

### 5.21.2.2 struct v2x\_gnss\_fix\_rates\_supported\_list\_t

Defines supported GNSS fix generation rates (such as 1 Hz, 5 Hz, 10 Hz).

#### Data fields

Type	Field	Description
uint32_t	qty_rates_↔ supported	Specify whether the listing or discovery of the supported rates is supported.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>
pb_size_t	rates_↔ supported_hz_↔ _array_count	Number of supported rates.
uint32_t	rates_↔ supported_hz_↔ _array[32]	Array of data rates supported by the API.

### 5.21.2.3 struct v2x\_init\_t

Defines client initialization.

#### Data fields

Type	Field	Description
uint32_t	log_level_mask	Log levels as defined in syslog.h.
char	server_ip_↔ addr[32]	IP address of the server.

### 5.21.2.4 struct v2x\_kinematics\_capabilities\_t feature\_flags\_t

Defines Kinematics features supported by the hardware.

#### Data fields

Type	Field	Description
bool	has_3_axis_↔ gyro	Specifies whether the hardware supports 3-axis gyro. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>
bool	has_3_axis_↔ accelerometer	Specifies whether the hardware supports the 3-axis accelerometer. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>
bool	has_imu_↔ supplemented_↔ _dead_↔ reckoning	Specifies whether a dead reckoning (DR) solution is available and enabled or only GNSS is the result. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – GNSS is available</li> <li>• 1 – DR is available</li> </ul>
bool	has_yaw_rate_↔ _sensor	Specifies whether the IMU includes a yaw rate sensor. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Does not include sensor</li> <li>• 1 – Includes sensor</li> </ul>
bool	used_vehicle_↔ _speed	Specifies whether the DR algorithm uses the vehicle speed sensor. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Does not use sensor</li> <li>• 1 – Uses sensor</li> </ul>
bool	used_single_↔ wheel_ticks	Specifies whether the DR algorithm uses the single wheel ticks. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Does not use ticks</li> <li>• 1 – Uses ticks</li> </ul>
bool	used_front_↔ differential_↔ wheel_ticks	Specifies whether the DR algorithm uses two front differential wheel ticks. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Does not use ticks</li> <li>• 1 – Uses ticks</li> </ul>
bool	used_rear_↔ differential_↔ wheel_ticks	Specifies whether the DR algorithm uses two rear differential wheel ticks. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Does not use ticks</li> <li>• 1 – Uses ticks</li> </ul>

Type	Field	Description
bool	used_vehicle_↔ _dynamic_↔ model	Specifies whether the DR algorithm uses vehicle dynamic model factoring in differential ticks, steering, and so on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Does not use factoring</li> <li>• 1 – Uses factoring</li> </ul>

### 5.21.2.5 struct v2x\_rates\_t

Defines the rate type.

#### Data fields

Type	Field	Description
uint32_t	rate_report_hz	Requested or reported current number of fixes per second.
uint32_t	offset_↔ nanoseconds	Currently unsupported.

### 5.21.2.6 struct v2x\_kinematics\_capabilities\_t

Returned via v2x\_kinematics\_get\_capabilities() for the client to discover the lower level function that this system supports.

#### Data fields

Type	Field	Description
v2x_↔ kinematics_↔ _capabilities_↔ _t_feature_↔ flags_t	feature_flags	Features supported by the API.
uint32_t	max_fix_rate_↔ _supported_hz	Highest rate platform that supports GNSS fix generation (in Hz).
v2x_gnss_↔ fix_rates_↔ supported_↔ list_t	rates_list	Supported fix rates.

### 5.21.2.7 struct v2x\_location\_fix\_t

Contains a standardized set of parameters that are used for ITS applications.

The contents of this structure do not include every possible GNSS element (for example, raw range data is not included). These fields are via low latency for safety applications, both to use locally and to load into a J2945/1 or ETSI G5 EN302.637-2 CAM. For example, the fields are used for CAM-type and BSM-type safety beacons.

This structure is populated for each location or dead-reckoning fix, and it is supplied on the fix available callback.

Predefined J2735s can be used to communicate raw SV observations and RTK correction data. Currently, however, they are not supplied from this structure.

#### Data fields

Type	Field	Description
double	utc_fix_time	UTC time in seconds.
<a href="#">v2x_fix_mode_t</a>	fix_mode	Location engine used to produce this record. <b>Supported values:</b> No fix, 2D, 3D, RTCM
double	latitude	Latitude in degrees.
double	longitude	Longitude in degrees.
double	altitude	Altitude in meters above the geoid (mean sea level).
uint32_t	qty_SV_in_view	Number of usable space vehicles (SV) that should be in view.
uint32_t	qty_SV_used	Actual number of SVs used in this fix calculation.
<a href="#">v2x_GNSSstatus_t</a>	gnss_status	Status of the GNSS data.
bool	has_SemiMajorAxisAccuracy	Specifies whether the value of the SemiMajorAxisAccuracy field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	SemiMajorAxisAccuracy	Accuracy of the major axis, in meters.
bool	has_SemiMinorAxisAccuracy	Specifies whether the value of the SemiMinorAxisAccuracy field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	SemiMinorAxisAccuracy	Accuracy of the minor axis, in meters.
bool	has_SemiMajorAxisOrientation	Specifies whether the value of the SemiMajorAxisOrientation field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>

Type	Field	Description
double	SemiMajor↔ AxisOrientation	Orientation of the major axis, in meters.
bool	has_heading	Specifies whether the value of the heading field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	heading	Track degrees relative to true north.
bool	has_velocity	Specifies whether the value of the velocity field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	velocity	Speed over ground in meters/second.
bool	has_climb	Specifies whether the value of the climb field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	climb	Vertical speed in meters/second.
bool	has_lateral_↔ acceleration	Specifies whether the value of the lateral_acceleration field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	lateral_↔ acceleration	Acceleration in a latitudinal direction, in meters/second <sup>^2</sup> .
bool	has_↔ longitudinal_↔ acceleration	Specifies whether the value of the longitudinal acceleration field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	longitudinal_↔ acceleration	Acceleration in a longitudinal direction, in meters/second <sup>^2</sup> .
bool	has_vehicle_↔ vertical_↔ acceleration	Specifies whether the value of the vehicle_vertical_acceleration field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	vehicle_↔ vertical_↔ acceleration	Vertical acceleration of the vehicle in G force.
bool	has_yaw_rate↔ _degrees_per↔ _second	Specifies whether the value of the yaw_rate_degrees_per_second field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>

Type	Field	Description
double	yaw_rate_↔ degrees_per_↔ second	Yaw rate in degrees/second, per SAE J2735.
bool	has_yaw_rate_↔ _95pct_↔ confidence	Specifies whether the value of the yaw_rate_95pct_confidence field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	yaw_rate_↔ 95pct_↔ confidence	95% confidence (2 sigma) on the yaw rate in degrees/second.
bool	has_lane_↔ position_↔ number	Specifies whether the value of the lane_position_number field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	lane_position_↔ _number	Current lane number, where 0 is either the outer-most edge of the hard shoulder or off-road.
bool	has_lane_↔ position_↔ 95pct_↔ confidence	Specifies whether the value of the lane_position_95pct_confidence field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
double	lane_position_↔ _95pct_↔ confidence	95% confidence range on the lane position.
bool	has_time_↔ confidence	Specifies whether the value of the time_confidence field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
float	time_↔ confidence	95% (2 sigma) confidence in number of seconds.
bool	has_heading_↔ confidence	Specifies whether the value of the heading_confidence field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
float	heading_↔ confidence	95% heading confidence in degrees.
bool	has_velocity_↔ confidence	Specifies whether the value of the velocity_confidence field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
float	velocity_↔ confidence	95% velocity confidence in meters/second.

Type	Field	Description
bool	has_elevation↔ _confidence	Specifies whether the value of the elevation_confidence field is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not valid</li> <li>• 1 – Valid</li> </ul>
float	elevation_↔ confidence	95% uncertainty range (2 sigma) confidence in meters.
uint32_t	leap_seconds	Indicates that both UTC and GPS are required because IEEE 1609.2 security requires operations to be performed in raw GPS time.

## 5.21.3 Enumeration Type Documentation

### 5.21.3.1 enum v2x\_fix\_mode\_t

Valid GNSS fix modes.

#### Enumerator

**V2X\_GNSS\_MODE\_NOT\_SEEN** SV is unavailable or not in view.

**V2X\_GNSS\_MODE\_NO\_FIX** No SV fix.

**V2X\_GNSS\_MODE\_2D** 2D fix with latitude and longitude information.

**V2X\_GNSS\_MODE\_3D** 3D fix with latitude, longitude, and altitude information.

## 5.21.4 Function Documentation

### 5.21.4.1 v2x\_api\_ver\_t v2x\_kinematics\_api\_version ( void )

Gets the compiled API version interface (as an integer number).

#### Returns

[v2x\\_api\\_ver\\_t](#) – Filled with the version number, build date, and detailed build information.

#### 5.21.4.2 `v2x_kinematics_handle_t v2x_kinematics_init ( v2x_init_t * param, v2x_kinematics_init_callback_t cb, void * context )`

Initializes the Kinematics library.

##### Associated data types

[v2x\\_init\\_t](#)

[v2x\\_kinematics\\_init\\_callback\\_t](#)

##### Parameters

in	<i>param</i>	Pointer to the structure that contains parameters for the IP address of the server, logging level, and so on.
in	<i>cb</i>	Callback function called when initialization is complete.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

##### Returns

Handle number to use with subsequent calls.

[V2X\\_KINEMATICS\\_HANDLE\\_BAD](#) – Upon an error.

### 5.21.4.3 v2x\_status\_enum\_type v2x\_kinematics\_start\_rate\_notification ( v2x\_kinematics\_handle\_t *handle*, v2x\_kinematics\_rate\_notification\_listener\_t *cb*, void \* *context* )

Gets the current rate and offset from the Kinematics library.

#### Associated data types

[v2x\\_kinematics\\_handle\\_t](#)

[v2x\\_kinematics\\_rate\\_notification\\_listener\\_t](#)

#### Parameters

in	<i>handle</i>	Handle number to use with subsequent calls. If there is an error in initialization, the value is -1.
in	<i>cb</i>	Callback function used to report rate notification changes.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

#### Returns

Indication of success or failure from [v2x\\_status\\_enum\\_type](#).

#### 5.21.4.4 `v2x_status_enum_type v2x_kinematics_set_rate ( v2x_kinematics_handle_t handle, v2x_rates_t * rate, v2x_kinematics_set_rate_callback_t cb, void * context )`

Sets the current rate and offset from the Kinematics library.

##### Associated data types

[v2x\\_kinematics\\_handle\\_t](#)

[v2x\\_rates\\_t](#)

[v2x\\_kinematics\\_set\\_rate\\_callback\\_t](#)

##### Parameters

in	<i>handle</i>	Handle number to use with subsequent calls. If there is an error in initialization, the value is -1.
in	<i>rate</i>	Pointer to the rate structure filled with the fix timing parameters.
in	<i>cb</i>	Callback function called when rates and offsets are successfully set. This parameter can be NULL.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

##### Returns

Indication of success or failure from [v2x\\_status\\_enum\\_type](#).

**5.21.4.5 v2x\_status\_enum\_type v2x\_kinematics\_register\_listener ( v2x\_kinematics\_↔  
\_handle\_t *handle*, v2x\_kinematics\_newfix\_listener\_t *listener*, void \* *context*  
)**

Registers for a Kinematics result listener callback at the requested rate.

#### Associated data types

[v2x\\_kinematics\\_handle\\_t](#)

[v2x\\_kinematics\\_newfix\\_listener\\_t](#)

#### Parameters

in	<i>handle</i>	Handle number to use with subsequent calls. If there is an error in initialization, the value is -1.
in	<i>listener</i>	Callback function to use for this listener.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

#### Detailed description

This function requests GNSS fix/motion callbacks at a specified rate (Hz) with a specified offset.

Only certain rates are supported (such as 1 Hz, 2 Hz, 5 Hz, 10 Hz), which are obtained from [v2x\\_kinematics\\_get\\_capabilities\(\)](#).

Currently, a request cannot be made for a rate slower than 1 Hz.

#### Returns

Indication of success or failure from [v2x\\_status\\_enum\\_type](#).

#### 5.21.4.6 `v2x_status_enum_type v2x_kinematics_deregister_listener ( v2x_kinematics_handle_t handle, v2x_kinematics_deregister_callback_t cb, void * context )`

Deregisters a previously registered GNSS fix that the listener established earlier via `v2x_kinematics_register_listener()`.

#### Associated data types

`v2x_kinematics_handle_t`  
`v2x_kinematics_deregister_callback_t`

#### Parameters

in	<i>handle</i>	Handle number of the registered fix.
in	<i>cb</i>	Callback function to use for this listener. This parameter can be NULL.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

#### Returns

Indication of success or failure from `v2x_status_enum_type`.

#### 5.21.4.7 `v2x_status_enum_type v2x_kinematics_final ( v2x_kinematics_handle_t handle, v2x_kinematics_final_callback_t cb, void * context )`

Terminates the Kinematics library.

##### Associated data types

[v2x\\_kinematics\\_handle\\_t](#)

[v2x\\_kinematics\\_final\\_callback\\_t](#)

##### Parameters

in	<i>handle</i>	Handle number of the library.
in	<i>cb</i>	Callback function called when termination is complete. This parameter can be NULL.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

##### Returns

Indication of success or failure from [v2x\\_status\\_enum\\_type](#).

**5.21.4.8 void v2x\_kinematics\_enable\_fixes ( v2x\_kinematics\_handle\_t *handle* )**

Enables the Kinematics fixes from GNSS.

**Associated data types**

[v2x\\_kinematics\\_handle\\_t](#)

**Parameters**

in	<i>handle</i>	Unique identifier for the library.
----	---------------	------------------------------------

**Returns**

None.

**5.21.4.9 void v2x\_kinematics\_disable\_fixes ( v2x\_kinematics\_handle\_t *handle* )**

Disables the Kinematics fixes from GNSS.

**Associated data types**

[v2x\\_kinematics\\_handle\\_t](#)

**Parameters**

in	<i>handle</i>	Unique identifier for the library.
----	---------------	------------------------------------

**Returns**

None.

## 5.22 C Radio APIs

This section contains C Radio APIs related to Cellular-V2X operation. Applications need to have "radio" Linux group permissions to be able to operate successfully with underlying services. For any new CV2x development, it is recommended to use the C++ [telux::cv2x::\\*](#) APIs.

Abstraction of the radio driver parameters for a V2X broadcast socket interface, including 3GPP CV2X QoS bandwidth contracts.

### 5.22.1 Define Documentation

#### 5.22.1.1 **#define V2X\_RADIO\_HANDLE\_BAD (-1)**

Invalid handle returned by [v2x\\_radio\\_init\(\)](#) and [v2x\\_radio\\_init\\_v2\(\)](#) upon an error.

#### 5.22.1.2 **#define V2X\_MAX\_RADIO\_SESSIONS (10)**

Limit on the number of simultaneous RmNet Radio interfaces this library can have open at once.

Typically, there are only a few actual radios. On the same radio however, one interface can be for IP traffic, and another interface can be for non-IP traffic.

#### 5.22.1.3 **#define V2X\_RX\_WILDCARD\_PORTNUM (9000)**

Wildcard value for a port number. When the wildcard is used, all V2X received traffic is routed.

#### 5.22.1.4 **#define MAX\_POOL\_IDS\_LIST\_LEN (20)**

Maximum length of the pool ID list that is returned in [v2x\\_iface\\_capabilities\\_t](#).

#### 5.22.1.5 **#define MAX\_MALICIOUS\_IDS\_LIST\_LEN (50)**

Maximum length of the malicious ID list that can be passed in [v2x\\_radio\\_update\\_trusted\\_ue\\_list\(\)](#).

#### 5.22.1.6 **#define MAX\_TRUSTED\_IDS\_LIST\_LEN (50)**

Maximum length of the trusted ID list that can be passed in [v2x\\_radio\\_update\\_trusted\\_ue\\_list\(\)](#).

#### 5.22.1.7 **#define MAX\_SUBSCRIBE\_SIDS\_LIST\_LEN (10)**

Maximum length for the subscribed service ID list that can be passed in [v2x\\_radio\\_rx\\_sock\\_create\\_and\\_bind\\_v2\(\)](#).

#### 5.22.1.8 **#define MAX\_FILTER\_IDS\_LIST\_LEN (50)**

Maximum length for the L2 ID list that can be passed in [v2x\\_set\\_l2\\_filters\(\)](#) and [v2x\\_cancel\\_l2\\_filters](#).

#### 5.22.1.9 **#define V2X\_MAX\_ANTENNAS\_SUPPORTED (2)**

Maximum number of antennas that is supported. Used in [v2x\\_tx\\_status\\_report\\_t](#)

**5.22.1.10 #define V2X\_MAX\_TX\_POOL\_NUM (2)**

Maximum number of V2X Tx pools that is supported. Used in [v2x\\_radio\\_status\\_ex\\_t](#)

**5.22.1.11 #define V2X\_MAX\_RX\_POOL\_NUM (4)**

Maximum number of V2X Rx pools that is supported. Used in [v2x\\_radio\\_status\\_ex\\_t](#)

**5.22.1.12 #define V2X\_MAX\_SLSS\_SYNC\_REF\_UE\_NUM (16)**

Maximum number of detected SLSS sync reference UEs. Used in [v2x\\_slss\\_rx\\_info\\_t](#)

**5.22.2 Data Structure Documentation****5.22.2.1 struct v2x\_status\_info\_t**

Encapsulates CV2X Tx/Rx status and cause of failure.

**Data fields**

Type	Field	Description
<a href="#">v2x_radio_↔ status_type_t</a>	status	Tx/Rx status
<a href="#">v2x_radio_↔ cause_type_t</a>	cause	Cause of failure

**5.22.2.2 struct v2x\_radio\_status\_t**

Encapsulates status of CV2X radio.

**Data fields**

Type	Field	Description
<a href="#">v2x_status_↔ info_t</a>	tx_status	TX status
<a href="#">v2x_status_↔ info_t</a>	rx_status	RX status

**5.22.2.3 struct v2x\_pool\_status\_t**

Encapsulates status for single TX/RX pool.

**Data fields**

Type	Field	Description
uint8_t	pool_id	pool ID
<a href="#">v2x_status_↔ info_t</a>	status	Tx/Rx pool status

### 5.22.2.4 struct v2x\_radio\_status\_ex\_t

V2X overall radio status and per pool status.

#### Data fields

Type	Field	Description
<a href="#">v2x_radio_status_t</a>	status	CV2X overall TX/RX status
uint8_t	tx_pool_size	Number of Tx pools in array of pool_status.
<a href="#">v2x_pool_status_t</a>	tx_pool_status[V2X_MAX_TX_POOL_NUM]	CV2X Tx pool status.
uint8_t	rx_pool_size	Number of Rx pools in array of pool_status.
<a href="#">v2x_pool_status_t</a>	rx_pool_status[V2X_MAX_RX_POOL_NUM]	CV2X Rx pool status.

### 5.22.2.5 struct trusted\_ue\_info\_t

Contains time confidence, position confidence, and propagation delay for a trusted UE.

#### Data fields

Type	Field	Description
uint32_t	source_l2_id	L2 ID of the trusted source
float	time_uncertainty	Time uncertainty in milliseconds.
uint16_t	time_confidence_level	Deprecated. Use time_uncertainty instead. Confidence level of the time period. <b>Supported values:</b> 0 through 127, where 0 is invalid or unavailable and 127 is the most confident
uint16_t	position_confidence_level	Confidence level of the position. <b>Supported values:</b> 0 through 127, where 0 is invalid or unavailable and 127 is the most confident
uint32_t	propagation_delay	Propagation delay in microseconds.

### 5.22.2.6 struct tx\_pool\_id\_info\_t

Contains minimum and maximum EARFCNs for a Tx pool ID. Multiple Tx Pools allow the same radio and overall frequency range to be shared for multiple types of traffic like V2V and V2X. Each pool ID and frequency range corresponds to a certain type of traffic. Both edge guard bands are not included in the EARFCN range reported. The calculation for the full bandwidth includes both edge guard bands is:  
bandwidth(MHz) = (max\_freq-min\_freq)/9. This struct is used in [v2x\\_iface\\_capabilities\\_t](#).

**Data fields**

<b>Type</b>	<b>Field</b>	<b>Description</b>
uint8_t	pool_id	ID of the Tx pool.
uint16_t	min_freq	Minimum EARFCN of this pool.
uint16_t	max_freq	Maximum EARFCN of this pool.

### 5.22.2.7 struct v2x\_iface\_capabilities\_t

Contains information on the capabilities of a Radio interface.

#### Data fields

Type	Field	Description
int	link_ip_MTU↔ _bytes	Maximum data payload length (in bytes) of a packet supported by the IP Radio interface.
int	link_non_ip↔ MTU_bytes	Maximum data payload length (in bytes) of a packet supported by the non-IP Radio interface.
v2x↔ concurrency↔ sel_t	max↔ supported↔ concurrency	Indicates whether this interface supports concurrent WWAN with V2X (PC5).
uint16_t	non_ip_tx↔ payload↔ offset_bytes	<p>Byte offset in a non-IP Tx packet before the actual payload begins. In 3GPP CV2X, the first byte after the offset is the 1-byte V2X Family ID.</p> <p>This offset is to the left for a per-packet Tx header that includes Tx information that might be inserted in front of the packet payload (in subsequent releases).</p> <p>An example of Tx information is MAC/Phy parameters (power, rate, retransmissions policy, and so on).</p> <p>Currently, this value is expected to be 0. But it is reserved to support possible per-packet Tx/Rx headers that might be added in future releases of this API.</p>
uint16_t	non_ip_rx↔ payload↔ offset_bytes	<p>Byte offset in a non-IP Rx packet before the actual payload begins. Initially, this value is zero. But it allows for later insertion of per-packet Rx information (sometimes called metadata) to be added to the front of the data payload. An example of Rx information is MAC/Phy measurements (receive signal strength, timestamps, and so on).</p> <p>The V2X Family ID is considered as part of the payload in the 3GPP CV2X. Higher layers (applications that are clients to this API) must remove or advance past that 1 byte to get to the more familiar actual WSMP/Geonetworking payload.</p>
uint16_t	int_min↔ periodicity↔ multiplier_ms	<p>Lowest number of milliseconds requested for a bandwidth.</p> <p>This value is also the basis for all possible bandwidth reservation periods. For example, if this multiplier=100 ms, applications can only reserve bandwidths of 100 ms, 200 ms, up to 1000 ms.</p>
uint16_t	int↔ maximum↔ periodicity_ms	Least frequent bandwidth periodicity that is supported. Above this value, use event-driven periodic messages of a period larger than this value.
unsigned	supports↔ 10ms↔ periodicity: 1	<p>Indicates whether n*10 ms periodicities are supported.</p> <p><b>Supported values:</b></p> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>

Type	Field	Description
unsigned	supports_↔ 20ms_↔ periodicity: 1	Indicates whether an n*20 ms bandwidth reservation is supported. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>
unsigned	supports_↔ 50ms_↔ periodicity: 1	Indicates whether 50 ms periodicity is supported. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>
unsigned	supports_↔ 100ms_↔ periodicity: 1	Indicates whether the basic minimum periodicity of 100 ms is supported. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not supported</li> <li>• 1 – Supported</li> </ul>
unsigned	max_quantity↔ _of_auto_↔ retrans: 4	Maximum number automatic retransmissions. <b>Supported values:</b> 0 through 15
unsigned	size_of_↔ layer2_mac_↔ address: 4	Size of the L2 MAC address. Different Radio Access Technologies have different-sized L2 MAC addresses: 802.11 has 6 bytes, whereas 3GPP PC5 has only 3 bytes. Because a randomized MAC address comes from an HSM with good pseudo random entropy, higher layers must know how many bytes of the MAC address to generate.
uint16_t	v2x_number_↔ of_priority_↔ levels	Number of different priority levels supported. For example, 8 is the current 3GPP standard (where a lower number means a higher priority).
uint16_t	highest_↔ priority_value	Least urgent priority number supported by this radio. Higher numbers are lower priority, so if the full range is supported, this value is <a href="#">V2X_PRIO_BACKGROUND</a> .
uint16_t	lowest_↔ priority_value	Highest priority value (most urgent traffic). Lower numbers are higher priority, so if the highest level supported this value is <a href="#">V2X_PRIO_MOST_URGENT</a> .
uint16_t	max_qty_SP↔ S_flows	Maximum number of supported SPS reservations.
uint16_t	max_qty_non↔ _SPS_flows	Maximum number of supported event flows (non-SPS ports).
int32_t	max_tx_pwr	Maximum supported transmission power in dBm.
int32_t	min_tx_pwr	Minimum supported transmission power in dBm.
uint32_t	tx_pool_ids_↔ supported_len	Length of the tx_pool_ids_supported array.
<a href="#">tx_pool_id_↔ info_t</a>	tx_pool_ids_↔ supported[M↔ <a href="#">AX_POOL_I↔ DS_LIST_L↔ EN]</a>	Array of Tx pool IDs and their associated minimum and maximum frequencies.

### 5.22.2.8 struct v2x\_tx\_bandwidth\_reservation\_t

Used when requesting a QoS bandwidth contract, which is implemented in PC5 3GPP V2-X radio as a *Semi Persistent Flow* (SPS).

The underlying radio providing the interface might support periodicities of various granularity in 100 ms integer multiples (such as 200 ms, 300 ms, and 400 ms).

The reservation is also used internally as a handle.

#### Data fields

Type	Field	Description
int	v2xid	Variable length 4-byte PSID or ITS_AID, or another application ID.
<a href="#">v2x_priority_et</a>	priority	Specifies one of the 3GPP levels of priority for the traffic that is pre-reserved on the SPS flow. Use <a href="#">v2x_radio_query_capabilities()</a> to get the exact number of supported priority levels.
int	period_↔ interval_ms	Bandwidth-reserved periodicity interval in milliseconds. There are limits on which intervals the underlying radio supports. Use the capabilities query method to discover the <code>int_min_periodicity_multiplier_ms</code> and <code>int_maximum_periodicity_ms</code> supported intervals.
int	tx_↔ reservation_↔ size_bytes	Number of Tx bandwidth bytes that are sent every periodicity interval.

### 5.22.2.9 struct v2x\_chan\_meas\_params\_t

Contains the measurement parameters for configuring the MAC/Phy radio channel measurements (such as CBR utilization).

The radio chip contains requests on radio measurement parameters that API clients can use to specify the following:

- How their higher-level application requires the CBR/CBP to be measured
- Over which time window
- When to send a report

#### Data fields

Type	Field	Description
int	channel_↔ measurement_↔ _interval_us	Duration in microseconds of the sliding window size.
int	rs_threshold_↔ decidbm	Parameter to the radio CBR measurement that is used for determining how busy the channel is. Signals weaker than the specified receive strength (RSRP, or RSSI) are not considered to be in use (busy).

### 5.22.2.10 struct v2x\_chan\_measurements\_t

Periodically returned by the radio with all measurements about the radio channel, such as the amount of noise and bandwidth saturation (channel\_busy\_percentage, or CBR).

#### Data fields

Type	Field	Description
float	channel_busy_↔ _percentage	No measurement parameters are supplied.
float	noise_floor	Measurement of the background noise for a quiet channel.
float	time_↔ uncertainty	V2X time uncertainty in milliseconds.

### 5.22.2.11 struct v2x\_radio\_calls\_t

Contains callback functions used in a v2x\_radio\_init() and v2x\_radio\_init\_v2 call.

The radio interface uses these callback functions for events such as completion of initialization, a Layer-02 MAC address change, or a status event (loss of sufficient GPS time precision to transmit).

These callbacks are related to a specific radio interface, and its MAC/Phy parameters, such as transmit power, bandwidth utilization, and changes in radio status.

#### Data Fields

- void(\* v2x\_radio\_init\_complete)(v2x\_status\_enum\_type status, void \*context)
- void(\* v2x\_radio\_status\_listener)(v2x\_event\_t event, void \*context)
- void(\* v2x\_radio\_chan\_meas\_listener)(v2x\_chan\_measurements\_t \*measurements, void \*context)
- void(\* v2x\_radio\_l2\_addr\_changed\_listener)(int new\_l2\_address, void \*context)
- void(\* v2x\_radio\_macphy\_change\_complete\_cb)(void \*context)
- void(\* v2x\_radio\_capabilities\_listener)(v2x\_iface\_capabilities\_t \*caps, void \*context)
- void(\* v2x\_service\_status\_listener)(v2x\_service\_status\_t status, void \*context)

#### 5.22.2.11.1 Field Documentation

##### 5.22.2.11.1.1 void(\* v2x\_radio\_calls\_t::v2x\_radio\_init\_complete)(v2x\_status\_enum\_type status, void \*context)

Callback that indicates initialization is complete.

#### Associated data types

[v2x\\_status\\_enum\\_type](#)

#### Parameters

in	<i>status</i>	Updated current radio status that indicates whether transmit and receive are ready.
in	<i>context</i>	Pointer to the context that was supplied during initial registration.

**5.22.2.11.1.2 void(\* v2x\_radio\_calls\_t::v2x\_radio\_status\_listener) (v2x\_event\_t event, void \*context)**

Callback made when the status in the radio changes. For example, in response to a fault when there is a loss of GPS timing accuracy.

**Deprecated** This callback is deprecated, please consider use v2x\_ext\_radio\_status\_listener instead.

**Associated data types**

[v2x\\_event\\_t](#)

**Parameters**

in	<i>event</i>	Delivery of the event that just occurred, such losing the ability to transmit.
in	<i>context</i>	Pointer to the context of the caller who originally registered for this callback.

**5.22.2.11.1.3 void(\* v2x\_radio\_calls\_t::v2x\_radio\_chan\_meas\_listener) (v2x\_chan\_measurements\_t \*measurements, void \*context)**

Callback made from lower layers when periodic radio measurements are prepared.

**Associated data types**

[v2x\\_chan\\_measurements\\_t](#)

**Parameters**

in	<i>measurements</i>	Pointer to the periodic measurements.
in	<i>context</i>	Pointer to the context of the caller who originally registered for this callback.

**5.22.2.11.1.4 void(\* v2x\_radio\_calls\_t::v2x\_radio\_l2\_addr\_changed\_listener) (int new\_l2\_address, void \*context)**

Callback made by the platform SDK when the MAC address (L2 SRC address) changes.

**Parameters**

in	<i>new_l2_address</i>	New L2 source address as an integer (because the L2 address is 3 bytes).
in	<i>context</i>	Pointer to the context of the caller who originally registered for this callback.

**5.22.2.11.1.5 void(\* v2x\_radio\_calls\_t::v2x\_radio\_macphy\_change\_complete\_cb) (void \*context)**

Callback made to indicate that the requested radio MAC/Phy change (such as channel/frequency and power) has completed.

**Parameters**

in	<i>context</i>	Pointer to the context of the caller who originally registered for this callback.
----	----------------	---

**5.22.2.11.1.6 void(\* v2x\_radio\_calls\_t::v2x\_radio\_capabilities\_listener) (v2x\_iface\_capabilities\_t \*caps, void \*context)**

Callback made when V2X capabilities change.

**Associated data types**

[v2x\\_iface\\_capabilities\\_t](#)

**Parameters**

in	<i>caps</i>	Pointer to the capabilities of this interface.
in	<i>context</i>	Pointer to the context of the caller who originally registered for this callback.

**5.22.2.11.1.7 void(\* v2x\_radio\_calls\_t::v2x\_service\_status\_listener) (v2x\_service\_status\_t status, void \*context)**

Callback made when the service status changes.

**Associated data types**

[v2x\\_service\\_status\\_t](#)

**Parameters**

in	<i>status</i>	Service status.
in	<i>context</i>	Pointer to the context of the caller who originally registered for this callback.

### 5.22.2.12 struct v2x\_sps\_mac\_details\_t

Contains MAC information that is reported from the actual MAC SPS in the radio. The offsets can periodically change on any given transmission report.

#### Data fields

Type	Field	Description
uint32_t	periodicity_↔ in_use_ns	Actual transmission interval period (in nanoseconds) scheduled relative to 1PP 0:00.00 time.
uint16_t	currently_↔ reserved_↔ periodic_bytes	Actual number of bytes currently reserved at the MAC layer. This number can be slightly larger than original request.
uint32_t	tx_↔ reservation_↔ offset_ns	Actual offset, from a 1PPS pulse and Tx flow periodicity, that the MAC selected and is using for the transmit reservation.  If data goes to the radio with enough time, it can be transmitted on the medium in the next immediately scheduled slot.
uint64_t	utc_time_ns	Absolute UTC start time of next selected grant, in nanoseconds.

### 5.22.2.13 struct v2x\_per\_sps\_reservation\_calls\_t

Callback functions used in `v2x_radio_tx_sps_sock_create_and_bind()` calls.

#### Data Fields

- `void(* v2x_radio_l2_reservation_change_complete_cb )(void *context, v2x_sps_mac_details_t *details)`
- `void(* v2x_radio_sps_offset_changed )(void *context, v2x_sps_mac_details_t *details)`

#### 5.22.2.13.1 Field Documentation

##### 5.22.2.13.1.1 `void(* v2x_per_sps_reservation_calls_t::v2x_radio_l2_reservation_change_complete_cb)(void *context, v2x_sps_mac_details_t *details)`

Callback made upon completion of a reservation change that a `v2x_radio_tx_reservation_change()` call initiated for a MAC/Phy contention.

The current SPS offset and reservation parameter are passed in the details structure returned by the pointer details.

#### Associated data types

[v2x\\_sps\\_mac\\_details\\_t](#)

#### Parameters

in	<i>context</i>	Pointer to the application context.
in	<i>details</i>	Pointer to the MAC information.

**5.22.2.13.1.2** `void(* v2x_per_sps_reservation_calls_t::v2x_radio_sps_offset_changed)(void *context, v2x_sps_mac_details_t *details)`

Callback periodically made when the MAC SPS timeslot changes. The new reservation offset is in the details structure returned by pointer details.

#### Associated data types

[v2x\\_sps\\_mac\\_details\\_t](#)

#### Parameters

in	<i>measurements</i>	Pointer to the channel measurements.
in	<i>context</i>	Pointer to the context.

#### Detailed description

This callback can occur when a MAC contention triggers a new reservation time slot to be selected. It is relevant only to connections opened with [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\(\)](#).

### 5.22.2.14 struct v2x\_slss\_sync\_ref\_ue\_info\_t

Encapsulates parameters of an SLSS sync reference UE. Used in [v2x\\_slss\\_rx\\_info\\_t](#).

#### Data fields

Type	Field	Description
uint16_t	slss_id	The SLSS ID of the sync reference UE that is defined in 3GPP TS 36.331 chapter 6.3.8.
bool	in_coverage	Indicates whether or not the UE is in coverage of GNSS that is defined in 3GPP TS 36.331 chapter 6.5.2.
<a href="#">v2x_slss_sync_pattern_t</a>	pattern	Indicates the SLSS sync pattern of the UE that is defined in 3GPP TS 36.331 chapter 6.3.8.
uint8_t	rsrp	SLSS RSRP value of the UE in dBm is ((float)rsrp - 256)/2.
bool	selected	Indicates whether or not the sync reference UE has been selected as the timing source.

### 5.22.2.15 struct v2x\_slss\_rx\_info\_t

Encapsulates parameters of CV2X SLSS Rx Information.

Used in [v2x\\_get\\_slss\\_rx\\_info](#) and [v2x\\_slss\\_rx\\_info\\_listener](#).

#### Data fields

Type	Field	Description
uint32_t	num_ue	The number of SLSS sync reference UEs in array ueInfo.
<a href="#">v2x_slss_sync_ref_ue_info_t</a>	ue_info[V2X_MAX_SLS_SYNC_REF_UE_NUM]	Array of detected SLSS sync reference UEs.

### 5.22.2.16 struct v2x\_tx\_flow\_info\_t

Advanced parameters that can be specified for Tx SPS and event-driven flows.

#### Data fields

Type	Field	Description
<a href="#">v2x_auto_retransmit_policy_t</a>	retransmit_policy	V2X retransmit policy.
uint8_t	default_tx_power_valid	Indicates whether the default Tx power is specified. <b>Supported values:</b> <ul style="list-style-type: none"> <li>0 – Default power is not specified</li> <li>1 – Default power is specified and is valid</li> </ul>
int32_t	default_tx_power	Default power used for transmission.

Type	Field	Description
uint8_t	mcs_index_↔ valid	Indicates whether the MCS index is specified. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Index is not specified</li> <li>• 1 – Index is specified and is valid</li> </ul>
uint8_t	mcs_index	MCS index number
uint8_t	tx_pool_id_↔ valid	Indicates whether the Tx pool ID is valid. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – ID is not specified</li> <li>• 1 – ID is specified and is valid</li> </ul>
uint8_t	tx_pool_id	ID of the Tx pool.
uint8_t	is_unicast_↔ valid	Indicates whether is_unicast is specified. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Is unicast is not specified</li> <li>• 1 – Is unicast is specified and is valid</li> </ul>
uint8_t	is_unicast	Non zero if requested flow is unicast. Note: Unicast flows ignore subscribed Service Ids

### 5.22.2.17 struct v2x\_sock\_info\_t

Parameters to identify a Tx or Rx socket.

#### Data fields

Type	Field	Description
int	sock	Pointer to the file descriptor for the socket.
struct sockaddr_↔ in6	sockaddr	IPv6 socket address. The sockaddr_in6 buffer is initialized with the IPv6 source address and source port that are used for the bind() function.

### 5.22.2.18 struct v2x\_sid\_list\_t

Parameters to identify a service ID list.

#### Data fields

Type	Field	Description
int	length	number of services IDs included in the array of sid.
uint32_t	sid[ <a href="#">MAX_S_↔</a> <a href="#">UBSCRIBE_↔</a> <a href="#">SIDS_LIST_↔</a> <a href="#">LEN</a> ]	array of service IDs.

### 5.22.2.19 struct v2x\_tx\_sps\_flow\_info\_t

Advanced parameters that can be specified for Tx SPS flows.

#### Data fields

Type	Field	Description
<a href="#">v2x_tx_↔ bandwidth↔ _reservation_t</a>	reservation	Transmit reservation information.
<a href="#">v2x_tx_flow_↔ info_t</a>	flow_info	Transmit resource information about the SPS Tx flow.

### 5.22.2.20 struct socket\_info\_t

Parameters that can be specified for the creation of CV2X socket.

#### Data fields

Type	Field	Description
uint32_t	service_id	V2X service ID bound to the CV2X socket.
uint16_t	local_port	Local port number of the CV2X socket used for binding.

### 5.22.2.21 struct src\_l2\_filter\_info\_t

Contains remote UE source L2 ID that expecting to filter.

#### Data fields

Type	Field	Description
uint32_t	src_l2_id	< remote UE L2 addr to filter. Duration, in millisecond (resolution 100 msec).
uint32_t	duration_ms	/* Proximity service per packet priority (PPPP), packets with priority above this value will be dropped. Range 0-7, 0 mean all of the pkts will be dropped.
uint8_t	pppp	

### 5.22.2.22 struct v2x\_rf\_tx\_info\_t

Tx status per Tx chain and Tx power per Tx antenna for a specific transport block.

#### Data fields

Type	Field	Description
<a href="#">rf_status_t</a>	status	Fault detection status for a specific Tx chain.
int32_t	power	The target Tx power after MPR/AMPR reduction for a specific Tx antenna in dBm*10 format. Invalid value is -700, it means the corresponding antenna is not being used for the transmission of this transport block.

### 5.22.2.23 struct v2x\_tx\_status\_report\_t

Information on Tx status of a V2X transport block that is reported from low layer.

1. A V2X Tx packet might trigger multiple reports because of the segmentaion and re-Tx in low layer.
2. If a transport block is dropped in low layer, no report will be triggered for that transport block.
3. The power in the array of rfInfo is the target Tx power value in dBm\*10 after MPR/AMPR reduction for a specific Tx antenna. The status in the array of rfInfo is the fault detection status for a specific Tx chain.
  - In CDD mode, two antennas have transmission for a specific transport block, both rfInfo[0].power and rfInfo[1].power are valid (not -700), rfInfo[i].status is reflecting the status of Tx chain/Tx antenna i.
  - In TXD mode, data transmission swtiches between two antennas/chains and only one antenna/chain has transmission for a specific transport block, the Tx antenna being used has valid power (not -700) in the array of rfInfo, rfInfo[i].status is reflecting the status of Tx chain i or the status of the Tx antenna i whose power is valid (not -700) in the array of rfInfo. Used in [v2x\\_tx\\_status\\_report\\_listener](#)

#### Data fields

Type	Field	Description
<a href="#">v2x_rf_tx_info_t</a>	<a href="#">rf_info[V2X_MAX_ANNAS_SUPPOTED]</a>	Tx status per Tx chain and Tx power per Tx antenna.
uint8_t	num_rb	Number of resource blocks used for the transport block.
uint8_t	start_rb	Start resource block index used for the transport block.
uint8_t	mcs	Modulation and coding scheme used for the transport block that is defined in 3GPP TS 36.213.
uint8_t	seg_num	Total number of segments of a V2X packet.
<a href="#">v2x_segment_type_t</a>	seg_type	Segment type of the transport block.
<a href="#">v2x_tx_type_t</a>	tx_type	Indication of new Tx or re-Tx of the transport block.
uint16_t	ota_timing	OTA timing in format of system frame number*10 + subframe number.
uint16_t	port	Port number that can be used to link the report to a specific Tx flow which has the same source port number.

## 5.22.3 Enumeration Type Documentation

### 5.22.3.1 enum v2x\_concurrency\_sel\_t

Describes whether the radio chip modem should attempt or support concurrent 3GPP CV2X operation with a WWAN 4G/5G data call.

Some chips are only capable of operating on CV2X. In this case:

- The callers can only request V2X\_WWAN\_NONCONCURRENT.

- The interface parameters that are returned list `v2x_concurrency_sel_t` as the value for `V2X_WAN_NONCONCURRENT`.

#### Enumerator

**`V2X_WWAN_NONCONCURRENT`** No simultaneous WWAN + CV2X on this interface.

**`V2X_WWAN_CONCURRENT`** Interface allows requests for concurrent support of WWAN + CV2X connections.

#### 5.22.3.2 enum `v2x_event_t`

Event indications sent asynchronously from the radio via callbacks that indicate the state of the radio. The state can change in response to the loss of timing precision or a geofencing change.

**Deprecated** This enum type is deprecated, please consider use `v2x_radio_status_ex_t` instead.

#### Enumerator

**`V2X_INACTIVE`** V2X communication is disabled.

**`V2X_ACTIVE`** V2X communication is enabled. Transmit and receive are possible.

**`V2X_TX_SUSPENDED`** Small loss of timing precision occurred. Transmit is no longer supported.

**`V2X_RX_SUSPENDED`** Radio can no longer receive any messages.

**`V2X_TXRX_SUSPENDED`** Radio can no longer transmit or receive for some reason.

### 5.22.3.3 enum v2x\_priority\_et

Range of supported priority levels, where a lower number means a higher priority. For example, 8 is the current 3GPP standard.

#### Enumerator

**V2X\_PRIO\_MOST\_URGENT** Highest priority.  
**V2X\_PRIO\_1**  
**V2X\_PRIO\_2**  
**V2X\_PRIO\_3**  
**V2X\_PRIO\_4**  
**V2X\_PRIO\_5**  
**V2X\_PRIO\_6**  
**V2X\_PRIO\_BACKGROUND** Lowest priority.

### 5.22.3.4 enum v2x\_service\_status\_t

Valid service availability states.

#### Enumerator

**SERVICE\_UNAVAILABLE**  
**SERVICE\_AVAILABLE**  
**SERVICE\_FAILED**

### 5.22.3.5 enum v2x\_radio\_status\_type\_t

Defines possible values for CV2X radio RX/TX status.

1. If Rx is in inactive state, Tx should also be in inactive state.
2. If Rx is in active state, Tx should be in active(normal case) or suspended state(sensing or tunnel mode).
3. If Rx is in suspended state, Tx should be in suspended state. Used in [v2x\\_status\\_info\\_t](#)

#### Enumerator

**V2X\_RADIO\_STATUS\_INACTIVE** RX/TX is inactive  
**V2X\_RADIO\_STATUS\_ACTIVE** RX/TX is active  
**V2X\_RADIO\_STATUS\_SUSPENDED** RX/TX is suspended  
**V2X\_RADIO\_STATUS\_UNKNOWN** RX/TX status unknown

### 5.22.3.6 enum v2x\_radio\_cause\_type\_t

Defines possible values for cause of CV2X radio failure. The cause code is only associated with cv2x suspend/inactive status, if cv2x is active, the cause code has no meaning. Used in [v2x\\_status\\_info\\_t](#)

#### Enumerator

**V2X\_RADIO\_CAUSE\_TIMING** CV2X is suspended due to the outage of timing reference.  
**V2X\_RADIO\_CAUSE\_CONFIG** CV2X is inactive due to v2x.xml is missing, invalid, or expired.

- V2X\_RADIO\_CAUSE\_UE\_MODE** CV2X is inactive due to CV2X mode is not started.
- V2X\_RADIO\_CAUSE\_GEOPOLYGON** CV2X is inactive due to UE enters a geo-polygon that does not support cv2x.
- V2X\_RADIO\_CAUSE\_THERMAL** CV2X is suspended when the device's temperature is high.
- V2X\_RADIO\_CAUSE\_THERMAL\_ECALL** CV2X is suspended when the device's temperature is high and emergency call is ongoing.
- V2X\_RADIO\_CAUSE\_GEOPOLYGON\_SWITCH** CV2X is suspended when UE switches to a new geopolygon that also supports CV2X and UE is already in CV2X active status, CV2X status will change to active after the update is done.
- V2X\_RADIO\_CAUSE\_SENSING** CV2X Tx is suspended when GNSS signal recovers or CV2X mode just starts. UE needs sensing for 1 second before Tx can begin, Tx status will change to active after sensing is done.
- V2X\_RADIO\_CAUSE\_LPM** CV2X is inactive when UE enters Low Power Mode.
- V2X\_RADIO\_CAUSE\_DISABLED** CV2X is inactive due to CV2X is disabled in the EFS.
- V2X\_RADIO\_CAUSE\_NO\_GNSS** CV2X is inactive due to GNSS signal is not available when starting CV2X.
- V2X\_RADIO\_CAUSE\_INVALID\_LICENSE** CV2X is inactive due to invalid license.
- V2X\_RADIO\_CAUSE\_UNKNOWN** Invalid cause type only used internally.

### 5.22.3.7 enum v2x\_auto\_retransmit\_policy\_t

V2X Tx retransmission policies supported by the modem.

#### Enumerator

- V2X\_AUTO\_RETRANSMIT\_DISABLED** Retransmit mode is disabled.
- V2X\_AUTO\_RETRANSMIT\_ENABLED** Retransmit mode is enabled.
- V2X\_AUTO\_RETRANSMIT\_DONT\_CARE** Modem falls back to its default behavior.

### 5.22.3.8 enum v2x\_slss\_sync\_pattern\_t

Defines possible values for SLSS sync pattern. Used in [v2x\\_slss\\_sync\\_ref\\_ue\\_info\\_t](#)

#### Enumerator

- V2X\_SLSS\_SYNC\_PATTERN\_OFFSET\_IND\_1** UE transmits SLSS in subframes indicated by the syncOffsetIndicator1 specified in V2X configuration.
- V2X\_SLSS\_SYNC\_PATTERN\_OFFSET\_IND\_2** UE transmits SLSS in subframes indicated by the syncOffsetIndicator2 specified in V2X configuration.
- V2X\_SLSS\_SYNC\_PATTERN\_OFFSET\_IND\_3** UE transmits SLSS in subframes indicated by the syncOffsetIndicator3 specified in V2X configuration.
- V2X\_SLSS\_SYNC\_PATTERN\_ODD\_RESERVED** UE transmits SLSS in odd-numbered reserved subframes.
- V2X\_SLSS\_SYNC\_PATTERN\_EVEN\_RESERVED** UE transmits SLSS in even-numbered reserved subframes.
- V2X\_SLSS\_SYNC\_PATTERN\_UNKNOWN** Unkown SLSS sync pattern.

### 5.22.3.9 enum traffic\_ip\_type\_t

V2X Ip Types

#### Enumerator

**TRAFFIC\_IP** Use Ip type traffic.

**TRAFFIC\_NON\_IP** Use Non-Ip type traffic.

### 5.22.3.10 enum rf\_status\_t

Fault detection for Tx chain that including PA and front end.

#### Enumerator

- INACTIVE** The Tx chain is not working.
- OPERATIONAL** The Tx chain is operational.
- FAULT** Fault detected on the Tx chain.

### 5.22.3.11 enum v2x\_segment\_type\_t

Defines possible values for the segment type of a transport block.

#### Enumerator

- FIRST** V2X packet is segmented, it's the first transport block.
- LAST** V2X packet is segmented, it's the last transport block.
- MIDDLE** V2X packet is segmented, it's a transport block between first and last.
- ONLY\_ONE** V2X packet is not segmented, it's the only one transport block.

### 5.22.3.12 enum v2x\_tx\_type\_t

Defines new Tx or re-Tx type relevant to a transport block.

#### Enumerator

- V2X\_NEW\_TX** New Tx of the V2X transport block.
- V2X\_RE\_TX** Re-Tx of the V2X transport block.
- V2X\_SLSS\_TX** Tx of SLSS.

## 5.22.4 Function Documentation

### 5.22.4.1 uint16\_t v2x\_convert\_priority\_to\_traffic\_class ( v2x\_priority\_et priority )

Converts a traffic priority to one of the 255 IPv6 traffic class bytes that are used in the data plane to indicate per-packet priority on non-SPS (event driven) data ports.

#### Associated data types

[v2x\\_priority\\_et](#)

#### Parameters

in	<i>priority</i>	Packet priority that is to be converted to an IPv6 traffic class. This priority is between the lowest and highest priority values returned in <a href="#">v2x_iface_capabilities_t</a> .
----	-----------------	--

#### Detailed description

This function is symmetric and is a reverse operation.

The traffic priority is one of the values between `min_priority_value` and `max_priority_value` returned in the [v2x\\_iface\\_capabilities\\_t](#) query.

**Returns**

IPv6 traffic class for achieving the calling input parameter priority level.

#### 5.22.4.2 `v2x_priority_et v2x_convert_traffic_class_to_priority ( uint16_t traffic_class )`

Maps an IPv6 traffic class to a V2X priority value.

##### Parameters

in	<i>traffic_class</i>	IPv6 traffic classification that came in a packet from the radio.
----	----------------------	---

##### Detailed description

This function is the inverse of the [v2x\\_convert\\_priority\\_to\\_traffic\\_class\(\)](#) function. It is symmetric and is a reverse operation.

##### Returns

Priority level (between highest and lowest priority values) equivalent to the input IPv6 traffic class parameter.

#### 5.22.4.3 `v2x_api_ver_t v2x_radio_api_version ( )`

Method used to query the platform SDK for its version number, build information, and build date.

##### Returns

[v2x\\_api\\_ver\\_t](#) – Contains the build date and API version number.

#### 5.22.4.4 `v2x_status_enum_type v2x_radio_query_capabilities ( v2x_iface_↔ capabilities_t * caps )`

Gets the capabilities of CV2X radio.

##### Associated data types

[v2x\\_iface\\_capabilities\\_t](#)

##### Parameters

out	<i>caps</i>	Pointer to the <a href="#">v2x_iface_capabilities_t</a> structure, which contains the capabilities of this specific interface.
-----	-------------	--

##### Returns

[V2X\\_STATUS\\_SUCCESS](#) – The radio is ready for data-plane sockets to be created and bound.

Error code – If there is a problem (see [v2x\\_status\\_enum\\_type](#)).

#### 5.22.4.5 `v2x_status_enum_type v2x_radio_deinit ( v2x_radio_handle_t handle )`

De-initializes a specific Radio interface.

##### Associated data types

[v2x\\_radio\\_handle\\_t](#)

##### Parameters

in	<i>handle</i>	Handle to the Radio that was initialized.
----	---------------	---

##### Returns

Indication of success or failure (see [v2x\\_status\\_enum\\_type](#)).

##### Dependencies

The interface must be pre-initialized with [v2x\\_radio\\_init\(\)](#) or [v2x\\_radio\\_init\\_v2\(\)](#). The handle from that function must be used as the parameter in this function.

#### 5.22.4.6 `int v2x_radio_rx_sock_create_and_bind ( v2x_radio_handle_t handle, int * sock, struct sockaddr_in6 * rx_sockaddr )`

Opens a new V2X radio receive socket, and initializes the given sockaddr buffer. The socket is also bound as an AF\_INET6 UDP type socket.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface.
out	<i>sock</i>	Pointer to the socket that, on success, returns the socket descriptor. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .
out	<i>rx_sockaddr</i>	Pointer to the IPv6 UDP socket. The sockaddr_in6 buffer is initialized with the IPv6 source address and source port that are used for the bind.

#### Detailed description

You can execute any sockopts that are appropriate for this type of socket (AF\_INET6).

The port number for the receive path is not exposed, but it is in the sockaddr\_ll structure (if the caller is interested).

#### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check errno.h.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

#### Dependencies

The interface must be pre-initialized with `v2x_radio_init()` or `v2x_radio_init_v2()`. The handle from that function must be used as the parameter in this function.

### 5.22.4.7 `int v2x_radio_rx_sock_create_and_bind_v2 ( v2x_radio_handle_t handle, int id_ist_len, uint32_t * id_list, int * sock, struct sockaddr_in6 * rx_sockaddr )`

Opens a new V2X radio receive socket with specific service IDs for subscription, and initializes the given sockaddr buffer. The socket is also bound as an AF\_INET6 UDP type socket.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface.
in	<i>id_ist_len</i>	Identifies the length of service ID list.
in	<i>id_list</i>	Pointer to the service ID list for subscription, subscribe wildcard if input nullptr.
out	<i>sock</i>	Pointer to the socket that, on success, returns the socket descriptor. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .
out	<i>rx_sockaddr</i>	Pointer to the IPv6 UDP socket. The sockaddr_in6 buffer is initialized with the IPv6 source address and source port that are used for the bind.

#### Detailed description

You can execute any sockopts that are appropriate for this type of socket (AF\_INET6).

This API can be used to subscribe wildcard, catchall port, or specific service IDs. The Rx port should be set with `v2x_set_rx_port()` before any subscription via this API, otherwise a default port number will be used.

Wildcard is used to receive all traffic. Only one port can be registered as wildcard port. Once wildcard is registered successfully, all received packets will be directed to wildcard port, and any subscription for specific service IDs or catchall port at other ports will be invalid. The parameter `id_list` of this API should be set to a null list for wildcard subscription.

Catchall port is used to receive packets with non-registered service IDs (via specific service IDs subscription). Only one port can be registered as catchall port. If catchall port is registered successfully, received packets with non-registered service ID will be directed to catchall port. All specific service IDs subscription (if any) should be performed before catchall port subscription. The parameter `id_list` of this API should include all non-registered service IDs for catchall port subscription.

Any port different from catchall port can be used to receive packets with specific service IDs. Only one port can be registered for a single service ID, a list of service IDs can be registered at a single port. To subscribe specific service IDs at a given Rx port, a Tx flow must be pre-setup with the Tx service ID set to any service ID included in the list of specific service IDs and the Tx source port set to the same port number as Rx port. The parameter `id_list` of this API should include all interested service IDs for the given Rx port.

## Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check `errno.h`.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

## Dependencies

The interface must be pre-initialized with `v2x_radio_init()`. The handle from that function must be used as the parameter in this function. The Rx port must be pre-set with `v2x_set_rx_port()`, otherwise a default port number will be used. For any specific service ID subscription, a Tx flow must be pre-setup using one of the following methods:

- [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_only\\_create\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_only\\_create\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v3\(\)](#)

#### 5.22.4.8 `int v2x_radio_rx_sock_create_and_bind_v3 ( v2x_radio_handle_t handle, uint16_t port_num, int id_list_len, uint32_t * id_list, int * sock, struct sockaddr_in6 * rx_sockaddr )`

Opens a new V2X radio receive socket with specific service IDs for subscription and specific port number for the receive path, and initializes the given sockaddr buffer. The socket is also bound as an AF\_INET6 UDP type socket.

This `v2x_radio_rx_sock_create_and_bind_v3()` method differs from `v2x_radio_rx_sock_create_and_bind_v2()` in that you can use the `port_num` parameter to specify the port number for the receive path.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface.
in	<i>port_num</i>	Identifies the port number for the receive path.
in	<i>id_list_len</i>	Identifies the length of service ID list.
in	<i>id_list</i>	Pointer to the service ID list for subscription, subscribe wildcard if input nullptr.
out	<i>sock</i>	Pointer to the socket that, on success, returns the socket descriptor. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .
out	<i>rx_sockaddr</i>	Pointer to the IPv6 UDP socket. The <code>sockaddr_in6</code> buffer is initialized with the IPv6 source address and source port that are used for the bind.

#### Detailed description

You can execute any sockopts that are appropriate for this type of socket (AF\_INET6).

This API can be used to subscribe wildcard, catchall port, or specific service IDs.

Wildcard is used to receive all traffic. Only one port can be registered as wildcard port. Once wildcard is registered successfully, all received packets will be directed to wildcard port, and any subscription for specific service IDs or catchall port at other ports will be invalid. The parameter `id_list` of this API should be set to a null list for wildcard subscription.

Catchall port is used to receive packets with non-registered service IDs (via specific service IDs subscription). Only one port can be registered as catchall port. If catchall port is registered successfully, received packets with non-registered service ID will be directed to catchall port. All specific service IDs subscription (if any) should be performed before catchall port subscription. The parameter `id_list` of this API should include all non-registered service IDs for catchall port subscription.

Any port different from catchall port can be used to receive packets with specific service IDs. Only one port can be registered for a single service ID, a list of service IDs can be registered at a single port. To subscribe specific service IDs at a given Rx port, a Tx flow must be pre-setup with the Tx service ID set to any service ID included in the list of specific service IDs and the Tx source port set to the same

port number as Rx port. The parameter `id_list` of this API should include all interested service IDs for the given Rx port.

### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check `errno.h`.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

### Dependencies

The interface must be pre-initialized with `v2x_radio_init()`. The handle from that function must be used as the parameter in this function. For any specific service ID subscription, a Tx flow must be pre-setup using one of the following methods:

- [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_only\\_create\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_only\\_create\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v3\(\)](#)

#### 5.22.4.9 int v2x\_radio\_enable\_rx\_meta\_data ( v2x\_radio\_handle\_t handle, bool enable, int id\_list\_len, uint32\_t \* id\_list )

Enable or disable the meta data report for the packets corresponding to the service IDs.

If enabled, the meta data report would be generated in addition to the actual OTA payload packet, and it comes from the same data interface as the OTA packet itself, it consist of RF RSSI (received signal strength indicator) status, 32-bit SCI Format 1 (3GPP TS 36.213, section 14.1), packet delay estimation, L2 destination ID, and the resource blocks used for the packet's transmission: subframe, subchannel index.

##### Associated data types

[v2x\\_radio\\_handle\\_t](#)

##### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface.
in	<i>enable</i>	enable or disable the meta data
in	<i>id_list_len</i>	number of the service IDs provided in the <i>id_list</i>
in	<i>id_list</i>	Pointer to the Rx service ID list

##### Detailed description

This function extracts the received packet's meta data from the payload, currently only NON-IP packets can have the meta data reported, it is not supported yet for IP packets.

If the meta data report is enabled for certain services, call [v2x\\_parse\\_rx\\_meta\\_data](#) to extract the meta data by providing a pointer to a object of type [rx\\_packet\\_meta\\_data\\_t](#), and the real payload.

##### Returns

0 – On success.

#### 5.22.4.10 int v2x\_radio\_sock\_create\_and\_bind ( v2x\_radio\_handle\_t handle, v2x\_tx\_sps\_flow\_info\_t \* tx\_flow\_info, v2x\_per\_sps\_reservation\_calls\_t \* calls, int tx\_sps\_portnum, int tx\_event\_portnum, int rx\_portnum, v2x\_↔ sid\_list\_t \* rx\_id\_list, v2x\_sock\_info\_t \* tx\_sps\_sock, v2x\_sock\_info\_t \* tx\_event\_sock, v2x\_sock\_info\_t \* rx\_sock )

Creates Tx SPS socket, Tx Event socket and Rx socket with specified parameters. The socket is also bound as an AF\_INET6 UDP type socket.

This [v2x\\_radio\\_sock\\_create\\_and\\_bind\(\)](#) method is the combination of function [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)/[v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v2](#) in the transmit direction and function [v2x\\_radio\\_rx\\_sock\\_create\\_and\\_bind\\_v3\(\)](#) in the receiving direction.

##### Associated data types

[v2x\\_radio\\_handle\\_t](#)

in	<i>handle</i>	Identifies the initialized Radio interface.
in	<i>tx_flow_info</i>	Pointer to the Tx SPS or event flow information. To create event flow, set reservation.v2xid and flow_info in this structure.
in	<i>calls</i>	Pointer to reservation callbacks or listeners. This parameter is called when underlying radio MAC parameters change related to the SPS bandwidth contract. For example, the callback after a reservation change, or if the timing offset of the SPS adjusts itself in response to traffic. This parameter passes NULL if no callbacks are required.
in	<i>tx_sps_portnum</i>	Requested Tx source port number for SPS transmissions, or -1 for no Tx sps flow.
in	<i>tx_event_portnum</i>	Requested Tx source port number for event transmissions, or -1 for no Tx event flow.
in	<i>rx_portnum</i>	Requested Rx destination port number, or -1 for no Rx subscription.
in	<i>rx_id_list</i>	Pointer to the Rx service ID list for subscription, subscribe wildcard if input nullptr.
out	<i>tx_sps_sock</i>	Pointer to the Tx sps socket that, on success, returns the socket descriptor and the IPv6 socket address. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .
out	<i>tx_event_sock</i>	Pointer to the Tx event socket that, on success, returns the socket descriptor and the IPv6 socket address. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .
out	<i>rx_sock</i>	Pointer to the Rx socket that, on success, returns the socket descriptor and the IPv6 socket address. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .

### Detailed description

You can execute any sockopts that are appropriate for this type of socket (AF\_INET6).

This API can be used for the registration of both Tx and Rx. It sets up sockets on the requested port numbers. A negative port number corresponds to no actions for Tx or Rx.

Wildcard is used to receive all traffic. Only one port can be registered as wildcard port. Once wildcard is registered successfully, all received packets will be directed to wildcard port, and any subscription for specific service IDs or catchall port at other ports will be invalid. The parameter *rx\_id\_list* of this API should be set to a null list for wildcard subscription.

Catchall port is used to receive packets with non-registered service IDs (via specific service IDs subscription). Only one port can be registered as catchall port. If catchall port is registered successfully, received packets with non-registered service ID will be directed to catchall port. All specific service IDs subscription (if any) should be performed before catchall port subscription. The parameter *rx\_id\_list* of this API should include all non-registered service IDs for catchall port subscription.

Any port different from catchall port can be used to receive packets with specific service IDs. Only one port can be registered for a single service ID, a list of service IDs can be registered at a single port. To subscribe specific service IDs at a given Rx port, a Tx flow should also be set up using this API. The parameter *rx\_id\_list* should include all interested service IDs for the given Rx port, the parameter *tx\_flow\_info.reservation.v2xid* should be set to one of the service ID included in *rx\_id\_list*, the

parameter tx\_sps\_portnum or tx\_event\_portnum should be set to the same port number as rx\_portnum.

### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check errno.h.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

### Dependencies

The interface must be pre-initialized with v2x\_radio\_init(). The handle from that function must be used as the parameter in this function.

**5.22.4.11** `int v2x_radio_tx_sps_sock_create_and_bind ( v2x_radio_handle_t handle, v2x_tx_bandwidth_reservation_t * res, v2x_per_sps_reservation_calls_t * calls, int sps_portnum, int event_portnum, int * sps_sock, struct sockaddr_in6 * sps_sockaddr, int * event_sock, struct sockaddr_in6 * event_sockaddr )`

Creates and binds a socket with a bandwidth-reserved (SPS) Tx flow with the requested ID, priority, periodicity, and size on a specified source port number. The socket is created as an IPv6 UDP socket.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)  
[v2x\\_tx\\_bandwidth\\_reservation\\_t](#)  
[v2x\\_per\\_sps\\_reservation\\_calls\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface on which this data connection is made.
in	<i>res</i>	Pointer to the parameter structure (how often the structure is sent, how many bytes are reserved, and so on).
in	<i>calls</i>	Pointer to reservation callbacks or listeners. This parameter is called when underlying radio MAC parameters change related to the SPS bandwidth contract. For example, the callback after a reservation change, or if the timing offset of the SPS adjusts itself in response to traffic. This parameter passes NULL if no callbacks are required.
in	<i>sps_portnum</i>	Requested source port number for the bandwidth reserved SPS transmissions.
in	<i>event_portnum</i>	Requested source port number for the bandwidth reserved event transmissions, or -1 for no event port.
out	<i>sps_sock</i>	Pointer to the socket that is bound to the requested port for Tx with reserved bandwidth.
out	<i>sps_sockaddr</i>	Pointer to the IPv6 UDP socket. The sockaddr_in6 buffer is initialized with the IPv6 source address and source port that are used for the bind() function. The caller can then use the buffer for subsequent sendto() function calls.
out	<i>event_sock</i>	Pointer to the socket that is bound to the event-driven transmission port.
out	<i>event_sockaddr</i>	Pointer to the IPV6 UDP socket. The sockaddr_in6 buffer is initialized with the IPv6 source address and source port that are used for the bind() function. The caller can then use the buffer for subsequent sendto() function calls.

## Detailed description

The radio attempts to reserve the flow with the specified size and rate passed in the request parameters.

This function is used only for Tx. It sets up two UDP sockets on the requested two HLOS port numbers.

For only a single SPS flow, indicate the event port number by using a negative number or NULL for the event\_sockaddr. For a single event-driven port, use [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\(\)](#) instead.

Because the modem endpoint requires a specific global address, all data sent on these sockets must have a configurable IPv6 destination address for the non-IP traffic.

The Priority parameter of the SPS reservation is used only for the reserved Tx bandwidth (SPS) flow. The non-SPS/event-driven data sent to the event\_portnum parameter is prioritized on the air, based on the IPv6 Traffic Class of the packet.

The caller is expected to identify two unused local port numbers to use for binding: one for the event-driven flow and one for the SPS flow.

This call is a blocking call. When it returns, the sockets are ready to use, assuming there is no error.

## Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check errno.h.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

## Dependencies

The interface must be pre-initialized with [v2x\\_radio\\_init\(\)](#) or [v2x\\_radio\\_init\\_v2\(\)](#). The handle from that function must be used as the parameter in this function.

#### 5.22.4.12 `int v2x_radio_tx_sps_only_create ( v2x_radio_handle_t handle, v2x_tx_↔ bandwidth_reservation_t * res, v2x_per_sps_reservation_calls_t * calls, int sps_portnum, int * sps_sock, struct sockaddr_in6 * sps_sockaddr )`

Creates a socket with a bandwidth-reserved (SPS) Tx flow.

Only SPS transmissions are to be implemented for the socket, which is created as an IPv6 UDP socket.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)  
[v2x\\_tx\\_bandwidth\\_reservation\\_t](#)  
[v2x\\_per\\_sps\\_reservation\\_calls\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface on which this data connection is made.
in	<i>res</i>	Pointer to the parameter structure (how often the structure is sent, how many bytes are reserved, and so on).
in	<i>calls</i>	Pointer to reservation callbacks or listeners. This parameter is called when underlying radio MAC parameters change related to the SPS bandwidth contract. For example, the callback after a reservation change, or if the timing offset of the SPS adjusts itself in response to traffic. This parameter passes NULL if no callbacks are required.
in	<i>sps_portnum</i>	Requested source port number for the bandwidth reserved SPS transmissions.
out	<i>sps_sock</i>	Pointer to the socket that is bound to the requested port for Tx with reserved bandwidth.
out	<i>sps_sockaddr</i>	Pointer to the IPv6 UDP socket. The <code>sockaddr_in6</code> buffer is initialized with the IPv6 source address and source port that are used for the <code>bind()</code> function. The caller can then use the buffer for subsequent <code>sendto()</code> function calls.

#### Detailed description

The radio attempts to reserve the flow with the specified size and rate passed in the request parameters.

This function is used only for Tx. It sets up a UDP socket on the requested HLOS port number.

Because the modem endpoint requires a specific global address, all data sent on the socket must have a configurable IPv6 destination address for the non-IP traffic.

The Priority parameter of the SPS reservation is used only for the reserved Tx bandwidth (SPS) flow.

The caller is expected to identify an unused local port number for the SPS flow.

This call is a blocking call. When it returns, the socket is ready to use, assuming there is no error.

**Returns**

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check errno.h.
- EINVAL – On failure to find the interface or get bad parameters.

**Dependencies**

The interface must be pre-initialized with `v2x_radio_init()` or `v2x_radio_init_v2()`. The handle from that function must be used as the parameter in this function.

### 5.22.4.13 `v2x_status_enum_type v2x_radio_tx_reservation_change ( int * sps_sock, v2x_tx_bandwidth_reservation_t * updated_reservation )`

Adjusts the reservation for transmit bandwidth.

#### Associated data types

[v2x\\_tx\\_bandwidth\\_reservation\\_t](#)

#### Parameters

out	<i>sps_sock</i>	Pointer to the socket bound to the requested port.
in	<i>updated_reservation</i>	Pointer to a bandwidth reservation with new reservation information.

#### Detailed description

This function will not update reservation priority. Can be used as follows:

- When the bandwidth requirement changes in periodicity (for example, due to an application layer DCC algorithm)
- Because the packet size is increasing (for example, due to a growing path history size in a BSM).

When the reservation change is complete, a callback to the structure is passed in a `v2x_radio_init()` or `v2x_radio_init_v2()` call.

#### Returns

[V2X\\_STATUS\\_SUCCESS](#).

Error code – If there is a problem (see [v2x\\_status\\_enum\\_type](#)).

#### Dependencies

An SPS flow must have been successfully initialized with the [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\(\)](#).

#### 5.22.4.14 `int v2x_radio_tx_event_sock_create_and_bind ( const char * interface, int v2x_id, int event_portnum, struct sockaddr_in6 * event_sock_addr, int * sock )`

Opens and binds an event-driven socket (one with no bandwidth reservation). The socket is bound as an AF\_INET6 UDP type socket.

##### Parameters

in	<i>interface</i>	Pointer to the operating system name to use. This interface is an RmNet interface (HLOS).
in	<i>v2x_id</i>	Used for transmissions that are ultimately mapped to an L2 destination address.
in	<i>event_portnum</i>	Local port number to which the socket is bound. Used for transmissions of this ID.
out	<i>event_sock_addr</i>	Pointer to the sockaddr_ll structure buffer to be initialized.
out	<i>sock</i>	Pointer to the file descriptor. Loaded when the function is successful.

##### Detailed description

This function is used only for Tx when no periodicity is available for the application type. If you know your transmit data periodicity, use [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\(\)](#) instead.

These event-driven sockets pay attention to QoS parameters in the IP socket.

##### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check `errno.h`.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

#### 5.22.4.15 `v2x_status_enum_type v2x_radio_start_measurements ( v2x_radio_↔ _handle_t handle, v2x_chan_meas_params_t * measure_this_way )`

Requests a channel utilization (CBP/CBR) measurement result on a channel.

##### Associated data types

[v2x\\_radio\\_handle\\_t](#)

[v2x\\_chan\\_meas\\_params\\_t](#)

##### Parameters

in	<i>handle</i>	Handle to the port.
in	<i>measure_this_way</i>	Indicates how and what to measure, and how often to send results. Some higher-level standards (like J2945/1 and ETSI TS102687 DCC) have specific time windows and items to measure.

##### Detailed description

This function uses the callbacks passed in during initialization to deliver the measurements. Measurement callbacks continue until the Radio interface is closed.

##### Returns

[V2X\\_STATUS\\_SUCCESS](#) – The radio is now ready for data-plane sockets to be created and bound.

[V2X\\_STATUS\\_FAIL](#) – CBR measurement is not supported yet.

##### Dependencies

The interface must be pre-initialized with `v2x_radio_init()` or `v2x_radio_init_v2()`. The handle from that function must be used as the parameter in this function.

#### 5.22.4.16 `v2x_status_enum_type v2x_radio_stop_measurements ( v2x_radio_handle_t handle )`

Discontinues any periodic MAC/Phy channel measurements and the reporting of them via listener calls.

##### Associated data types

[v2x\\_radio\\_handle\\_t](#)

##### Parameters

in	<i>handle</i>	Handle to the radio measurements to be stopped.
----	---------------	---

##### Returns

[V2X\\_STATUS\\_SUCCESS](#).

##### Dependencies

The measurements must have been started with [v2x\\_radio\\_start\\_measurements\(\)](#).

### 5.22.4.17 int v2x\_radio\_sock\_close ( int \* sock\_fd )

Closes a specified socket file descriptor and deregisters any modem resources associated with it (such as reserved SPS bandwidth contracts).

#### Parameters

in	<i>sock_fd</i>	Socket file descriptor.
----	----------------	-------------------------

#### Detailed description

This function works on receive, SPS, or event-driven sockets.

The socket file descriptor must be closed when the client exits. We recommend using a trap to catch controlled shutdowns.

#### Returns

Integer value of the close(sock) operation.

#### Dependencies

The socket must have been opened with one of the following methods:

- [v2x\\_radio\\_rx\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_only\\_create\(\)](#)
- [v2x\\_radio\\_tx\\_sps\\_only\\_create\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v2\(\)](#)
- [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v3\(\)](#)

**5.22.4.18 void v2x\_radio\_set\_log\_level ( int *new\_level*, int *use\_syslog* )**

Configures the V2X log level and destination for SDK and lower layers.

**Parameters**

in	<i>new_level</i>	Log level to set to one of the standard syslog levels (LOG_ERR, LOG_INFO, and so on).
in	<i>use_syslog</i>	Destination: send to stdout (0) or syslog (otherwise).

**Returns**

None.

**5.22.4.19 v2x\_event\_t cv2x\_status\_poll ( uint64\_t \* *status\_age\_useconds* )**

Polls for the recent V2X status.

**Parameters**

out	<i>status_age_useconds</i>	Pointer to the age in microseconds of the last event (radio status) that is being reported.
-----	----------------------------	---

**Detailed description**

This function does not generate any modem control traffic. For efficiency, it simply returns the most recently cached value that was reported from the modem (often reported at a high rate or frequent rate from the modem).

**Returns**

Indication of success or failure (see [v2x\\_status\\_enum\\_type](#)).

### 5.22.4.20 int v2x\_radio\_trigger\_l2\_update ( v2x\_radio\_handle\_t *handle* )

Triggers the modem to change its source L2 address by randomly generating a new address.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)

#### Parameters

in	<i>handle</i>	Initialized Radio interface on which this data connection is made.
----	---------------	--

#### Detailed description

When the change is complete, clients are notified of the new L2 address via the [v2x\\_radio\\_calls\\_t::v2x\\_radio\\_l2\\_addr\\_changed\\_listener\(\)](#) callback function.

#### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check errno.h.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

**5.22.4.21** `int v2x_radio_update_trusted_ue_list ( unsigned int malicious_list_len, unsigned int malicious_list[MAX_MALICIOUS_IDS_LIST_LEN], unsigned int trusted_list_len, trusted_ue_info_t trusted_list[MAX_TRUSTED_IDS_LIST_LEN] )`

Updates the list of malicious and trusted IDs tracked by the modem.

#### Associated data types

[trusted\\_ue\\_info\\_t](#)

#### Parameters

in	<i>malicious_list_len</i>	Number of malicious IDs in <i>malicious_list</i> .
in	<i>malicious_list</i>	List of malicious IDs.
in	<i>trusted_list_len</i>	Number of trusted IDs in <i>trusted_list</i> .
in	<i>trusted_list</i>	List of trusted IDs.

#### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check `errno.h`.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

**5.22.4.22** `int v2x_radio_tx_sps_sock_create_and_bind_v2 ( v2x_radio_handle_t handle, v2x_tx_sps_flow_info_t * sps_flow_info, v2x_per_sps_reservation_calls_t * calls, int sps_portnum, int event_portnum, int * sps_sock, struct sockaddr_in6 * sps_sockaddr, int * event_sock, struct sockaddr_in6 * event_sockaddr )`

Creates and binds a socket with a bandwidth-reserved (SPS) Tx flow with the requested ID, priority, periodicity, and size on a specified source port number. The socket is created as an IPv6 UDP socket.

This `v2x_radio_tx_sps_sock_create_and_bind_v2()` method differs from `v2x_radio_tx_sps_sock_create_and_bind()` in that you can use the `sps_flow_info` parameter to specify transmission resource information about the Tx flow.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)  
[v2x\\_tx\\_sps\\_flow\\_info\\_t](#)  
[v2x\\_per\\_sps\\_reservation\\_calls\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface on which this data connection is made.
in	<i>sps_flow_info</i>	Pointer to the flow information in the <a href="#">v2x_tx_sps_flow_info_t</a> structure.
in	<i>calls</i>	Pointer to reservation callbacks or listeners. This parameter is called when underlying radio MAC parameters change related to the SPS bandwidth contract. For example, the callback after a reservation change, or if the timing offset of the SPS adjusts itself in response to traffic. This parameter passes NULL if no callbacks are required.
in	<i>sps_portnum</i>	Requested source port number for the bandwidth reserved SPS transmissions.
in	<i>event_portnum</i>	Requested source port number for the bandwidth reserved event transmissions, or -1 for no event port.
out	<i>sps_sock</i>	Pointer to the socket that is bound to the requested port for Tx with reserved bandwidth.
out	<i>sps_sockaddr</i>	Pointer to the IPv6 UDP socket. The <code>sockaddr_in6</code> buffer is initialized with the IPv6 source address and source port that are used for the <code>bind()</code> function. The caller can then use the buffer for subsequent <code>sendto()</code> function calls.
out	<i>event_sock</i>	Pointer to the socket that is bound to the event-driven transmission port.
out	<i>event_sockaddr</i>	Pointer to the IPV6 UDP socket. The <code>sockaddr_in6</code> buffer is initialized with the IPv6 source address and source port that are used for the <code>bind()</code> function. The caller can then use the buffer for subsequent <code>sendto()</code> function calls.

## Detailed description

The radio attempts to reserve the flow with the specified size and rate passed in the request parameters.

This function is used only for Tx. It sets up two UDP sockets on the requested two HLOS port numbers.

For only a single SPS flow, indicate the event port number by using a negative number or NULL for the event\_sockaddr. For a single event-driven port, use [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\(\)](#) or [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v2\(\)](#) or [v2x\\_radio\\_tx\\_event\\_sock\\_create\\_and\\_bind\\_v3\(\)](#) instead.

Because the modem endpoint requires a specific global address, all data sent on these sockets must have a configurable IPv6 destination address for the non-IP traffic.

The Priority parameter of the SPS reservation is used only for the reserved Tx bandwidth (SPS) flow. The non-SPS/event-driven data sent to the event\_portnum parameter is prioritized on the air, based on the IPv6 Traffic Class of the packet.

The caller is expected to identify two unused local port numbers to use for binding: one for the event-driven flow and one for the SPS flow.

This call is a blocking call. When it returns, the sockets are ready to use, assuming there is no error.

## Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check errno.h.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

## Dependencies

The interface must be pre-initialized with [v2x\\_radio\\_init\(\)](#) or [v2x\\_radio\\_init\\_v2\(\)](#). The handle from that function must be used as the parameter in this function.

**5.22.4.23** `int v2x_radio_tx_sps_only_create_v2 ( v2x_radio_handle_t handle,  
v2x_tx_sps_flow_info_t * sps_flow_info, v2x_per_sps_reservation_calls_t * calls,  
int sps_portnum, int * sps_sock, struct sockaddr_in6 * sps_sockaddr )`

Creates a socket with a bandwidth-reserved (SPS) Tx flow.

Only SPS transmissions are to be implemented for the socket, which is created as an IPv6 UDP socket.

This `v2x_radio_tx_sps_only_create_v2()` method differs from `v2x_radio_tx_sps_only_create()` in that you can use the `sps_flow_info` parameter to specify transmission resource information about the Tx flow.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)  
[v2x\\_tx\\_sps\\_flow\\_info\\_t](#)  
[v2x\\_per\\_sps\\_reservation\\_calls\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface on which this data connection is made.
in	<i>sps_flow_info</i>	Pointer to the flow information in the <a href="#">v2x_tx_sps_flow_info_t</a> structure.
in	<i>calls</i>	Pointer to reservation callbacks or listeners. This parameter is called when underlying radio MAC parameters change related to the SPS bandwidth contract. For example, the callback after a reservation change, or if the timing offset of the SPS adjusts itself in response to traffic. This parameter passes NULL if no callbacks are required.
in	<i>sps_portnum</i>	Requested source port number for the bandwidth reserved SPS transmissions.
out	<i>sps_sock</i>	Pointer to the socket that is bound to the requested port for Tx with reserved bandwidth.
out	<i>sps_sockaddr</i>	Pointer to the IPv6 UDP socket. The <code>sockaddr_in6</code> buffer is initialized with the IPv6 source address and source port that are used for the <code>bind()</code> function. The caller can then use the buffer for subsequent <code>sendto()</code> function calls.

#### Detailed description

The radio attempts to reserve the flow with the specified size and rate passed in the request parameters.

This function is used only for Tx. It sets up a UDP socket on the requested HLOS port number.

Because the modem endpoint requires a specific global address, all data sent on the socket must have a configurable IPv6 destination address for the non-IP traffic.

The caller is expected to identify an unused local port number to use for binding the SPS flow.

This call is a blocking call. When it returns, the socket is ready to use, assuming there is no error.

**Returns**

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check `errno.h`.
- EINVAL – On failure to find the interface or get bad parameters.

**Dependencies**

The interface must be pre-initialized with `v2x_radio_init()` or `v2x_radio_init_v2()`. The handle from that function must be used as the parameter in this function.

#### 5.22.4.24 `v2x_status_enum_type v2x_radio_tx_reservation_change_v2 ( int * sps_sock, v2x_tx_sps_flow_info_t * updated_flow_info )`

Adjusts the reservation for transmit bandwidth.

This `v2x_radio_tx_reservation_change_v2()` method differs from `v2x_radio_tx_reservation_change()` in that you can use the `updated_flow_info` parameter to specify transmission resource information about the Tx flow.

##### Associated data types

[v2x\\_tx\\_sps\\_flow\\_info\\_t](#)

##### Parameters

out	<code>sps_sock</code>	Pointer to the socket bound to the requested port.
in	<code>updated_flow_info</code>	Pointer to the new reservation information.

##### Detailed description

This function will not update reservation priority. Can be used as follows:

- When the bandwidth requirement changes in periodicity (for example, due to an application layer DCC algorithm)
- Because the packet size is increasing (for example, due to a growing path history size in a BSM).

When the reservation change is complete, a callback to the structure is passed in a `v2x_radio_init()` or `v2x_radio_init_v2()` call.

##### Returns

`V2X_STATUS_SUCCESS`.

Error code – On failure (see [v2x\\_status\\_enum\\_type](#)).

##### Dependencies

An SPS flow must have been successfully initialized with `v2x_radio_tx_sps_sock_create_and_bind()` or `v2x_radio_tx_sps_sock_create_and_bind_v2()`.

#### 5.22.4.25 `v2x_status_enum_type v2x_radio_tx_event_flow_info_change ( int * sock, v2x_tx_flow_info_t * updated_flow_info )`

Adjusts the flow parameters for an existing Tx event socket.

##### Associated data types

[v2x\\_tx\\_flow\\_info\\_t](#)

##### Parameters

out	<i>sock</i>	Pointer to the socket bound to the requested port.
in	<i>updated_flow_info</i>	Pointer to the new flow parameters.

##### Detailed description

When the reservation change is complete, a callback to the structure is passed in a `v2x_radio_init()` or `v2x_radio_init_v2()` call.

This call is a blocking call. When it returns, the socket is ready to be use, assuming there is no error.

##### Returns

`V2X_STATUS_SUCCESS`.

Error code – On failure (see `v2x_status_enum_type`).

##### Dependencies

An event flow must have been successfully initialized with `v2x_radio_tx_event_sock_create_and_bind()` or `v2x_radio_tx_event_sock_create_and_bind_v2()` or `v2x_radio_tx_event_sock_create_and_bind_v3()`.

#### 5.22.4.26 `v2x_status_enum_type start_v2x_mode ( )`

Starts V2X mode.

The V2X radio status must be `INACTIVE`. If the status is `ACTIVE` or `SUSPENDED` (see `v2x_event_t`), call `stop_v2x_mode()` first.

This call is a blocking call. When it returns, V2X mode has been started, assuming there is no error.

##### Returns

`V2X_STATUS_SUCCESS`.

Otherwise:

- `V2X_STATUS_EALREADY` – Failure because V2X mode is already started.
- `V2X_STATUS_FAIL` – Other failure.

##### Dependencies

V2X radio status must be `V2X_INACTIVE` (`v2x_event_t`).

#### 5.22.4.27 `v2x_status_enum_type stop_v2x_mode ( )`

Stops V2X mode.

The V2X radio status must be `ACTIVE` or `SUSPENDED` (see `v2x_event_t`). If the status is `INACTIVE`, call `start_v2x_mode()` first.

This call is a blocking call. When it returns, V2X mode has been stopped, assuming there is no error.

##### Returns

`V2X_STATUS_SUCCESS`.

Otherwise:

- `V2X_STATUS_EALREADY` – Failure because V2X mode is already stopped.
- `V2X_STATUS_FAIL` – Other failure.

##### Dependencies

V2X radio status must be `V2X_ACTIVE`, `V2X_TX_SUSPENDED`, `V2X_RX_SUSPENDED`, or `V2X_TXRX_SUSPENDED`.

**5.22.4.28 v2x\_radio\_handle\_t v2x\_radio\_init\_v2 ( traffic\_ip\_type\_t ip\_type, v2x\_concurrency\_sel\_t mode, v2x\_radio\_calls\_t \* callbacks\_p, void \* ctx\_p )**

**Deprecated** This API has been deprecated. Please use v2x\_radio\_init\_v3() instead.

Initializes the Radio interface and sets the callback that will be used when events in the radio change (including when radio initialization is complete).

#### Associated data types

[traffic\\_ip\\_type\\_t](#)  
[v2x\\_concurrency\\_sel\\_t](#)  
[v2x\\_radio\\_calls\\_t](#)

#### Parameters

in	<i>ip_type</i>	The Ip or non-IP interface.
in	<i>mode</i>	WAN concurrency mode, although the radio might not support concurrency. Errors can be generated.
in	<i>callbacks</i>	Pointer to the <a href="#">v2x_radio_calls_t</a> structure that is prepopulated with function pointers used during radio events (such as loss of time synchronization or accuracy) for subscribers. This parameter also points to a callback for this initialization function.
in	<i>context</i>	Voluntary pointer to the first parameter on the callback.

#### Detailed description

This function call is a nonblocking, and it is a control plane action.

Use [v2x\\_radio\\_deinit\(\)](#) when radio operations are complete.

Currently, the channel and transmit power are not specified. They are specified with a subsequent call to [v2x\\_radio\\_calls\\_t::v2x\\_radio\\_init\\_complete\(\)](#) when initialization is complete.

#### Returns

Handle to the specified initialized radio. The handle is used for reconfiguring, opening or changing, and closing reservations.

**V2X\_RADIO\_HANDLE\_BAD** – If there is an error. No initialization callback is made.

**5.22.4.29** `int v2x_radio_init_v3 ( v2x_concurrency_sel_t mode, v2x_radio_calls_t * callbacks_p, void * ctx_p, v2x_radio_handle_t * ip_handle_p, v2x_radio_handle_t * non_ip_handle_p )`

Initializes Cv2x radio and sets the callback that will be used when events in the radio change (including when radio initialization is complete). The callers can get the handles of Cv2x IP and non-IP interface on success. The handle of interface is used for reconfiguring, opening or changing, and closing reservations.

#### Associated data types

[v2x\\_concurrency\\_sel\\_t](#)

[v2x\\_radio\\_calls\\_t](#)

#### Parameters

in	<i>mode</i>	WAN concurrency mode, although the radio might not support concurrency. Errors can be generated.
in	<i>callbacks</i>	Pointer to the <a href="#">v2x_radio_calls_t</a> structure that is prepopulated with function pointers used during radio events (such as loss of time synchronization or accuracy) for subscribers. This parameter also points to a callback for this initialization function.
in	<i>context</i>	Voluntary pointer to the first parameter on the callback.
out	<i>ip_handle_p</i>	Pointer to the handle of IP interface. Pass nullptr if IP interface is not used.
out	<i>non_ip_handle_p</i>	Pointer to the handle of non-IP interface. Pass nullptr if non-IP interface is not used.

#### Detailed description

This function call is a nonblocking, and it is a control plane action.

Use [v2x\\_radio\\_deinit\(\)](#) with either IP or non-IP handle when radio operations are complete.

Currently, the channel and transmit power are not specified. They are specified with a subsequent call to [v2x\\_radio\\_calls\\_t::v2x\\_radio\\_init\\_complete\(\)](#) when initialization is complete.

#### Returns

0 – On success.

Otherwise:

- EINVAL – Invalid input parameters.
- EPERM – Radio initialization failed.

#### Dependencies

This API might fail if the underlying Cv2x status is currently in an inactive state. Use [v2x\\_register\\_ext\\_radio\\_status\\_listener](#) to register a listener for CV2X overall Tx/Rx status, then use [v2x\\_get\\_ext\\_radio\\_status](#) to get current V2X overall radio status.

**5.22.4.30** `int v2x_radio_tx_event_sock_create_and_bind_v3 ( traffic_ip_type_t ip_type, int v2x_id, int event_portnum, v2x_tx_flow_info_t * event_flow_info, struct sockaddr_in6 * event_sockaddr, int * sock )`

Opens and binds an event-driven socket (one with no bandwidth reservation). The socket is bound as an AF\_INET6 UDP type socket.

This `v2x_radio_tx_event_sock_create_and_bind_v3()` method differs from `v2x_radio_tx_event_sock_create_and_bind_v2()` in that you can use the `traffic_ip_type_t` parameter to specify traffic ip type instead of requiring the interface name.

#### Associated data types

[v2x\\_tx\\_flow\\_info\\_t](#) [traffic\\_ip\\_type\\_t](#)

#### Parameters

in	<i>ip_type</i>	traffice_ip_type.
in	<i>v2x_id</i>	Used for transmissions that are ultimately mapped to an L2 destination address.
in	<i>event_portnum</i>	Local port number to which the socket is bound. Used for transmissions of this ID.
in	<i>event_flow_info</i>	Pointer to the event flow parameters.
out	<i>event_sock_addr</i>	Pointer to the <code>sockaddr_ll</code> structure buffer to be initialized.
out	<i>sock</i>	Pointer to the file descriptor. Loaded when the function is successful.

#### Detailed description

This function is used only for Tx when no periodicity is available for the application type. If you know your transmit data periodicity, use `v2x_radio_tx_sps_sock_create_and_bind()` or `v2x_radio_tx_sps_sock_create_and_bind_v2()` instead.

These event-driven sockets pay attention to QoS parameters in the IP socket.

#### Returns

0 – On success.

Otherwise:

- EPERM – Socket creation failed; for more details, check `errno.h`.
- EAFNOSUPPORT – On failure to find the interface.
- EACCES – On failure to get the MAC address of the device.

### 5.22.4.31 v2x\_status\_enum\_type get\_iface\_name ( traffic\_ip\_type\_t *ip\_type*, char \* *iface\_name*, size\_t *buffer\_len* )

Returns interface name set during radio initialization.

#### Associated data types

traffic\_ip\_type\_t

#### Parameters

in	<i>ip_type</i>	traffic_ip_type_t
out	<i>iface_name</i>	pointer to buffer for interface name
in	<i>buffer_len</i>	length of the buffer passed for interface name. Must be at least the max buffer size for an interface name (IFNAMSIZE).

#### Detailed description

This function should only be called after successfully initializing a radio.

#### Returns

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error. Interface name will be an empty string.

### 5.22.4.32 `int v2x_radio_tcp_sock_create_and_bind ( v2x_radio_handle_t handle, const v2x_tx_flow_info_t * event_info, const socket_info_t * sock_info, int * sock_fd, struct sockaddr_in6 * sockaddr )`

Creates a TCP socket for event Tx and Rx. The socket is bound as an AF\_INET6 TCP type socket.

This `v2x_radio_tcp_sock_create_and_bind()` API creates a new TCP socket and binds the socket to the IPv6 address of local IP interface with specified source port. Additionally, this API also registers a Tx event flow and subscribes Rx with specified service ID to enable TCP control and data packets in both transmitting and receiving directions.

If the created socket is expected to work as TCP client mode, the caller must establish a connection to the address specified using function `connect()`, and then use the socket for `send()` and `recv()` on successful connection. The caller must release the created socket and associated resources with `v2x_radio_sock_close()`.

If the created socket is expected to work as TCP server mode, the caller must mark the created socket as a listening socket with function `listen()`, that is, as a socket that will be used to accept incoming connection requests using `accept()`. The caller can then use the connected socket returned by `accept()` for `send()` and `recv()`. The caller must close all connected sockets returned by `accept()` with function `close()` first, and then release the listening socket and associated resources with `v2x_radio_sock_close()`.

This call is a blocking call. When it returns, the created TCP socket is ready to use, assuming there is no error.

#### Associated data types

[v2x\\_radio\\_handle\\_t](#)

#### Parameters

in	<i>handle</i>	Identifies the initialized Radio interface. The caller must specify IP interface for radio initialization.
in	<i>event_info</i>	Pointer to the Tx event flow information.
in	<i>sock_info</i>	Pointer to the TCP socket information.
out	<i>sock_fd</i>	Pointer to the socket that, on success, returns the TCP socket descriptor. The caller must release this socket with <a href="#">v2x_radio_sock_close()</a> .
out	<i>sockaddr</i>	Pointer to the address of TCP socket. The <code>sockaddr_in6</code> buffer is initialized with the IPv6 source address and source port that are used for the bind.

#### Detailed description

You can execute any socketopts that are appropriate for this type of socket (AF\_INET6).

**Returns**

0 – On success.

Otherwise:

- EINVAL – On failure to find the interface or get bad parameters.
- EPERM – Socket operation failed; for more details, check errno.h.

**Dependencies**

The interface used for IP communication must be pre-initialized with `v2x_radio_init()`. The handle from that function must be used as the parameter in this function.

### 5.22.4.33 v2x\_status\_enum\_type v2x\_set\_peak\_tx\_power ( int8\_t txPower )

Set RF peak cv2x transmit power. This affects the power for all existing flows and for any flow created in the future.

Precondition – v2x mode enabled.

#### Parameters

in	<i>txPower</i>	Desired global Cv2x peak tx power in dbm
----	----------------	--

#### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

### 5.22.4.34 v2x\_status\_enum\_type v2x\_set\_l2\_filters ( uint32\_t list\_len, src\_l2\_filter\_info \* list\_array )

Set src L2 ID list for filtering. This affects/disables receiving packets from the src L2 IDs in the list.

#### Parameters

in	<i>list_len</i>	number of rc L2 IDs, max value 50
in	<i>list_array</i>	array that stores the src L2 IDs, durations and pppp values for filter

#### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

### 5.22.4.35 v2x\_status\_enum\_type v2x\_remove\_l2\_filters ( uint32\_t list\_len, uint32\_t \* l2\_id\_list )

Remove specific src L2 ID list for filtering. This affects/enables receiving packets from the src L2 IDs in the list.

#### Parameters

in	<i>list_len</i>	number of rc L2 IDs, max value 50
in	<i>l2_id_list</i>	array that stores the src L2 IDs

#### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

### 5.22.4.36 v2x\_status\_enum\_type v2x\_register\_tx\_status\_report\_listener ( uint16\_t port, v2x\_tx\_status\_report\_listener callback )

Registers a listener for CV2X Tx status report.

**Associated data types**

v2x\_tx\_status\_report\_listener

**Parameters**

in	<i>port</i>	Set this value to the port number of registered Tx Flow if user wants to receive Tx status report associated with its own Tx flow. If user wants to receive Tx status report associated with all Tx flows in system, set this value to 0.
in	<i>callback</i>	Callback function of <a href="#">v2x_tx_status_report_listener</a> structure that is called on Tx status reports.

**Detailed description**

This function should be called before the enable of Tx status report by calling `v2x_set_tx_status_report` if the caller has interest in the notification of CV2X Tx status reports.

**Returns**

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error.

**Dependencies**

CV2X radio must be pre-initialized with `v2x_radio_init_v2()` or `v2x_radio_init_v3()`.

### 5.22.4.37 `v2x_status_enum_type v2x_deregister_tx_status_report_listener ( uint16_t port )`

Deregisters a listener for CV2X Tx status report.

**Associated data types**

v2x\_tx\_status\_report\_listener

**Parameters**

in	<i>port</i>	Port number of previously registered <a href="#">v2x_tx_status_report_listener</a> that is to be deregistered. If the listener is registered with port number 0, set this value to 0 to deregister the listener.
----	-------------	--

**Detailed description**

User will not receive Tx status reports after the deregistration.

**Returns**

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error.

**Dependencies**

CV2X radio must be pre-initialized with [v2x\\_radio\\_init\\_v2\(\)](#) or [v2x\\_radio\\_init\\_v3\(\)](#).

#### 5.22.4.38 `v2x_status_enum_type v2x_set_global_IPaddr ( uint8_t prefix_len, uint8_t * ipv6_addr )`

Set CV2X global IP address for the IP interface.

##### Parameters

in	<i>prefix_len</i>	CV2X global IP address prefix length in bits, range [64, 128]
in	<i>ipv6_addr</i>	CV2X global IP address.

##### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

#### 5.22.4.39 `v2x_status_enum_type v2x_set_ip_routing_info ( uint8_t * dest_mac_addr )`

Set CV2X IP interface global IP unicast routing information.

##### Parameters

in	<i>dest_mac_addr</i>	CV2X destination L2 address for unicast routing purpose. expecting a 6 bytes array address, in which the L2 addr stored in the last 3 entries in big endian order.
----	----------------------	--

##### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

#### 5.22.4.40 `v2x_status_enum_type v2x_get_ext_radio_status ( v2x_radio_status_ex_t * status )`

Get current V2X overall radio status and per pool status.

##### Parameters

out	<i>status</i>	Pointer to structure <code>v2x_radio_status_ex_t</code> , which contains V2X overall radio status and per pool status on success.
-----	---------------	---

##### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

#### 5.22.4.41 **v2x\_status\_enum\_type v2x\_register\_ext\_radio\_status\_listener ( v2x\_ext\_radio\_status\_listener callback )**

Registers a listener for CV2X overall Tx/Rx status and per pool status.

##### Associated data types

v2x\_ext\_radio\_status\_listener

##### Parameters

in	<i>callback</i>	Callback function of <a href="#">v2x_ext_radio_status_listener</a> structure that is called on CV2X Tx/Rx status change.
----	-----------------	--

##### Returns

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error.

#### 5.22.4.42 **v2x\_status\_enum\_type v2x\_get\_slss\_rx\_info ( v2x\_slss\_rx\_info\_t \* slss\_info )**

Get the current V2X SLSS Rx information.

##### Parameters

out	<i>slss_info</i>	Pointer to structure <a href="#">v2x_slss_rx_info_t</a> , which contains V2X SLSS Rx information on success.
-----	------------------	--

##### Returns

V2X\_STATUS\_SUCCESS on success. Error status otherwise.

#### 5.22.4.43 **v2x\_status\_enum\_type v2x\_register\_slss\_rx\_listener ( v2x\_slss\_rx\_listener callback )**

Registers a listener for CV2X SLSS Rx information.

##### Associated data types

v2x\_slss\_rx\_info\_listener

##### Parameters

in	<i>callback</i>	Callback function of <a href="#">v2x_slss_rx_listener</a> structure that is called on SLSS Rx information change.
----	-----------------	---

**Returns**

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error.

#### 5.22.4.44 **v2x\_status\_enum\_type v2x\_deregister\_slss\_rx\_listener ( v2x\_slss\_rx\_listener callback )**

Deregisters a listener for CV2X SLSS Rx information.

**Associated data types**

[v2x\\_slss\\_rx\\_info\\_listener](#)

**Parameters**

in	<i>callback</i>	Previously registered <a href="#">v2x_slss_rx_listener</a> that is to be deregistered.
----	-----------------	--

**Returns**

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error.

## 5.23 C Vehicle APIs

This section contains C Vehicle APIs related to Cellular-V2X operation. These APIs are provided as reference APIs to work with QTI reference hardware. Customers would need to modify the implementation of these APIs based on the specific H/W and CAN controller being used.

Abstraction of the vehicle system parameters required for CAM/BSM ITS beacons.

### 5.23.1 Define Documentation

#### 5.23.1.1 **#define V2X\_VDATA\_HANDLE\_BAD (-1)**

Invalid handle returned when there is an error.

#### 5.23.1.2 **#define V2X\_J2735\_TRACTION\_CONTROL\_MAX (4)**

Guard check value on [v2x\\_transmission\\_state\\_enum\\_type](#) for [V2X\\_TRANSMISSION\\_MAX](#). This value is used in a 3-bit bitfield in J2735.

#### 5.23.1.3 **#define V2X\_TRACTION\_CTRL\_MAX (4)**

Guard check value on [v2x\\_TractionControlStatus\\_enum\\_type](#) for [V2X\\_TRACTION\\_CTRL\\_MAX](#). This value is used in a 2-bit bitfield in J2735.

#### 5.23.1.4 **#define J2735\_ABS\_MAX (4)**

Guard check value on [v2x\\_AntiLockBrakeStatus\\_enum\\_type](#).

This value cannot be part of the enumeration because the value eventually ends up in 2-bit bitfield over the air.

#### 5.23.1.5 **#define V2X\_STABILITY\_CONTROL\_MAX (4)**

Guard check value on [v2x\\_StabilityControlStatus\\_enum\\_type](#).

This value is eventually used over the air in a 2-bit bitfield. The enumeration value must never be larger than 4.

#### 5.23.1.6 **#define V2X\_AUX\_BRAKE\_MAX (4)**

Guard check value on [v2x\\_AuxBrakeStatus\\_enum\\_type](#). This value must never be set this high.

## 5.23.2 Data Structure Documentation

### 5.23.2.1 union v2x\_control\_status\_ut

Contains information related to ABS, TCS, stability control state, and other vehicle output controls that might occur and be ongoing. This structure mirrors the J2735 bit frames.

#### Data fields

Type	Field	Description
struct <a href="#">v2x_control_status_ut</a>	bits	Bit values for control status information. Bit values for control status information.
unsigned short	word	Byte data access to the packed v2x_control_status union structure.

### 5.23.2.2 struct v2x\_control\_status\_ut.bits

Bit values for control status information.

#### Data fields

Type	Field	Description
unsigned	unused_padding: 1	Reserved for 16-bit alignment. This field is critical because of 16-bit word access to the packed <a href="#">v2x_control_status_ut</a> union structure.
<a href="#">v2x_AuxBrakeStatus_enum_type</a>	aux_brake_status: 2	Indicates whether the auxiliary braking system is on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
<a href="#">v2x_BrakeBoostApplied_enum_type</a>	brake_boost_applied: 2	Indicates whether the brakes are actively being boosted. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not boosted</li> <li>• 1 – Boosted</li> </ul>
<a href="#">v2x_StabilityControlStatus_enum_type</a>	stability_control_status: 2	Indicates whether stability control is on and engaged. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
<a href="#">v2x_AntiLockBrakeStatus_enum_type</a>	antilock_brake_status: 2	Indicates the status of the ABS.
<a href="#">v2x_TractionControlStatus_enum_type</a>	traction_control_status: 2	Indicates whether status of the TCS.

Type	Field	Description
unsigned	rightRear: 1	Indicates whether the right rear brakes are actively being applied. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not applied</li> <li>• 1 – Applied</li> </ul>
unsigned	rightFront: 1	Indicates whether the right front brakes are actively being applied. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not applied</li> <li>• 1 – Applied</li> </ul>
unsigned	leftRear: 1	Indicates whether the left rear brakes are actively being applied <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not applied</li> <li>• 1 – Applied</li> </ul>
unsigned	leftFront: 1	Indicates whether the front left brakes are actively being applied. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not applied</li> <li>• 1 – Applied</li> </ul>
unsigned	unavailable: 1	No information is available.

### 5.23.2.3 union vehicleEventFlags\_ut

Contains critical events and communication of ongoing events. Also is used for combinations of critical and not critical (wipers) events

This typedef can match the J2735 2016 version or another version you are working with.

#### Data fields

Type	Field	Description
struct <a href="#">vehicle↔ EventFlags_ut</a>	bits	Bit values for vehicle event flags. A flag indicates the state of the event.Bit values for vehicle event flags.
unsigned short	data	Sixteen-bit word access to the packed vehicleEventFlags union structure.

### 5.23.2.4 struct vehicleEventFlags\_ut.bits

Bit values for vehicle event flags. A flag indicates the state of the event.

#### Data fields

Type	Field	Description
unsigned	unused: 3	Reserved for 16-bit alignment in the union access.
unsigned	eventAirBag↔ Deployment: 1	Indicates whether the airbag is deployed. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not deployed</li> <li>• 1 – Deployed</li> </ul>
unsigned	event↔ Disabled↔ Vehicle: 1	Indicates whether the vehicle is disabled. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not disabled</li> <li>• 1 – Disabled</li> </ul>
unsigned	eventFlatTire: 1	Indicates whether the tire is flat. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not flat</li> <li>• 1 – Flat</li> </ul>
unsigned	eventWipers↔ Changed: 1	Indicates the status of the windshield wipers. For more information, See the wiper state variables in <a href="#">current_dynamic_vehicle_state_t</a> .
unsigned	eventLights↔ Changed: 1	Indicates the status of one or more lights (such as blinkers and fog).
unsigned	eventHard↔ Braking: 1	Indicates whether hard braking is activated. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not activated</li> <li>• 1 – Activated</li> </ul>
unsigned	event↔ Reserved1: 1	Event bit reserved for future use. Do not use.
unsigned	event↔ Hazardous↔ Materials: 1	Indicates whether a hazmat load is present. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not present</li> <li>• 1 – Present</li> </ul>
unsigned	eventStability↔ Controlactivated↔ : 1	Indicates whether stability control is on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	eventTraction↔ ControlLoss: 1	Indicates whether traction control is activated (1) or not (0). <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not applied</li> <li>• 1 – Applied</li> </ul>

Type	Field	Description
unsigned	eventAB↔ Sactivated: 1	Indicates whether ABS is activated.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not activated</li> <li>• 1 – Activated</li> </ul>
unsigned	eventStop↔ LineViolation: 1	Indicates whether the vehicle has detected that a violation of the Stop Line is imminent.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not imminent</li> <li>• 1 – Imminent</li> </ul>
unsigned	eventHazard↔ Lights: 1	Indicates whether the hazard lights are on.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>

### 5.23.2.5 union ExteriorLights\_ut

Contains information about the state of the exterior lights.

#### Data fields

Type	Field	Description
struct <a href="#">Exterior↔ Lights_ut</a>	bits	Bit values for exterior light flags.Bit values for exterior light flags.
unsigned short	data	16-bit short word access to the packed ExteriorLights union structure.

### 5.23.2.6 struct ExteriorLights\_ut.bits

Bit values for exterior light flags.

#### Data fields

Type	Field	Description
unsigned	parking↔ LightsOn: 1	Indicates whether the parking lights are on.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	fogLightOn: 1	Indicates whether the fog lights are on.  <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>

Type	Field	Description
unsigned	daytime↔ Running↔ LightsOn: 1	Indicates whether the running lights are on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	automatic↔ LightControl↔ On: 1	Indicates whether the automatic light control is on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	hazardSignal↔ On: 1	Indicates whether the hazard lights are on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	rightTurn↔ SignalOn: 1	Indicates whether the right turn light is on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	leftTurn↔ SignalOn: 1	Indicates whether the left turn light is on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	highBeam↔ HeadlightsOn: 1	Indicates whether the high beam headlights are on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	lowBeam↔ HeadlightsOn: 1	Indicates whether the low beam headlights are on. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Off</li> <li>• 1 – On</li> </ul>
unsigned	unused: 7	Unused padding bits.

### 5.23.2.7 struct high\_resolution\_motion\_t

Contains high-resolution motion parameters.

#### Data fields

Type	Field	Description
double	vehicle_speed	Vehicle speed in meters/second.
double	longitudinal_↔ acceleration	Acceleration in a longitudinal direction, in meters/second <sup>2</sup> .
double	yaw_rate	Yaw rate in degrees/second, per SAE J2735.

### 5.23.2.8 struct current\_dynamic\_vehicle\_state\_t

Contains information about the dynamic state of the vehicle.

#### Data fields

Type	Field	Description
<a href="#">v2x_↔ transmission_↔ state_enum_↔ type</a>	prndl	Specifies the current state of the transmission gear: forward, reverse, and so on.
<a href="#">vehicleEvent↔ Flags_ut</a>	events	Flags all critical events and combinations of critical events.
double	throttle_↔ position	Per the J2735 definition, indicates the throttle position from 0% to 100%. However, this value is in double precision between 0 and 1.
double	throttle_↔ confidence	Per the J2735 definition, double precision degrees of confidence.
double	steering_↔ wheel_angle	Per the J2735 definition, double precision degrees of the wheel angle. <b>Supported values:</b> -192.0 through 189.0 degrees, with positive being turned to the right
<a href="#">v2x_control_↔ status_ut</a>	brake_status	Indicates whether brakes or emergency brakes (ABS) are activated. <b>Supported values:</b> <ul style="list-style-type: none"> <li>• 0 – Not activated</li> <li>• 1 – Activated</li> </ul>
<a href="#">Exterior↔ Lights_ut</a>	exterior_lights	Conglomeration of bits that indicate the status of the exterior lights, such as blinkers.
unsigned char	front_wiper_↔ status	Status of the front windshield wipers.
unsigned char	rear_wiper_↔ status	Status of the rear windshield wipers.

### 5.23.2.9 struct static\_vehicle\_parameters\_t

Contains static vehicle parameters.

#### Data fields

Type	Field	Description
double	vehicle_↔ height_cm	Vehicle height in centimeters. This parameter is 0 if the value is not yet available from the vehicle network.
double	vehicle_↔ width_cm	Vehicle width in centimeters. This parameter is 0 if the value is not yet available from the vehicle network.
double	vehicle_↔ length_cm	Vehicle length in centimeters. This parameter is 0 if the value is not yet available from the vehicle network.

Type	Field	Description
double	front_bumper↔ _height_cm	Height of the front bumper, in centimeters. This parameter is 0 if the value is not yet available from the vehicle network.
double	rear_bumper↔ height_cm	Height of the rear bumper, in centimeters. This parameter is 0 if the value is not yet available from the vehicle network.
double	vehicle_mass↔ _kg	Mass of the vehicle, in kilograms. This parameter is 0 if the value is not yet available from the vehicle network.
double	trailer↔ weight_kg	Weight of a trailer connected to the vehicle, in kilograms. This parameter is 0 if the value is not yet available from the vehicle network.
char *	make	Pointer to the NULL-terminated string with the vehicle manufacturer that this software build supports (such as Ford and GM).
char *	model	Pointer to the NULL-terminated string with the vehicle model name that this software build supports (such as Prius, Mustang, Rogue).
unsigned short	begin_model↔ _year	Beginning of the model years that this software build supports.
unsigned short	end_model↔ _year	End of model year that this software build supports. This year might be the same as begin_model_year.

## 5.23.3 Enumeration Type Documentation

### 5.23.3.1 enum v2x\_transmission\_state\_enum\_type

Valid types for main transmission drive states.

#### Enumerator

**V2X\_TRANSMISSION\_NEUTRAL**  
**V2X\_TRANSMISSION\_PARK**  
**V2X\_TRANSMISSION\_FORWARD\_GEAR** One of the gears: D, 1, 2, 3, ... .  
**V2X\_TRANSMISSION\_REVERSE\_GEAR**  
**V2X\_TRANSMISSION\_RESERVED1**  
**V2X\_TRANSMISSION\_RESERVED2**  
**V2X\_TRANSMISSION\_RESERVED3**  
**V2X\_TRANSMISSION\_UNAVAILABLE** Status is unknown.  
**V2X\_TRANSMISSION\_MAX** Sentry variable that must not be exceeded.

### 5.23.3.2 enum v2x\_BrakeBoostApplied\_enum\_type

Valid types for brake boosting states.

#### Enumerator

**V2X\_BRAKEBOOST\_UNAVAIL** Status is unknown.  
**V2X\_BRAKEBOOST\_OFF**  
**V2X\_BRAKEBOOST\_ON**  
**V2X\_BRAKEBOOST\_MAX** Sentry variable that must not be exceeded.

### 5.23.3.3 enum v2x\_TractionControlStatus\_enum\_type

Valid types for traction control states.

This enumeration currently matches the J2735 2016 version for the Traction Control System (TCS).

#### Enumerator

**V2X\_TRACTION\_CTRL\_UNAVAIL** Status is unknown.  
**V2X\_TRACTION\_CTRL\_OFF**  
**V2X\_TRACTION\_CTRL\_ON** On but currently not engaged.  
**V2X\_TRACTION\_CTRL\_ENGAGED** Actively being engaged.

#### 5.23.3.4 enum v2x\_AntiLockBrakeStatus\_enum\_type

Valid types for antilock-braking states.

This enumeration matches the J2735 2016 version for the Antilock Braking System (ABS) to help BSM packing and unpacking.

##### Enumerator

**V2X\_ABS\_Unavailable** ABS is not equipped, or the status is unknown.

**V2X\_ABS\_Off**

**V2X\_ABS\_On** On but currently not active.

**V2X\_ABS\_Engaged** Actively being engaged on one or more wheels.

#### 5.23.3.5 enum v2x\_StabilityControlStatus\_enum\_type

Valid types for the stability control status. This enumeration should be equivalent to the J2735 BSM version you are working with.

##### Enumerator

**V2X\_STABILITY\_CONTROL\_UNAVAILBLE** Stability Control status is unknown.

**V2X\_STABILITY\_CONTROL\_OFF** Stability Control is not applied.

**V2X\_STABILITY\_CONTROL\_ON** Stability Control is on, but currently it is not engaged.

**V2X\_STABILITY\_CONTROL\_ENGAGED** Stability Control is actively being engaged.

#### 5.23.3.6 enum v2x\_AuxBrakeStatus\_enum\_type

Valid types for the auxiliary brake status.

This enumeration should match the J2735 2016 version or any other version you are working with.

##### Enumerator

**V2X\_AUX\_BRAKE\_UNAVAILBLE** Vehicle has no auxiliary brake equipment or the status is unknown.

**V2X\_AUX\_BRAKE\_OFF**

**V2X\_AUX\_BRAKE\_ON**

**V2X\_AUX\_BRAKE\_RESERVED**

## 5.23.4 Function Documentation

### 5.23.4.1 `v2x_api_ver_t v2x_vehicle_api_version ( void )`

Gets the compiled API version interface (as an integer number).

#### Returns

`v2x_api_ver_t` – Filled with the version number, build date, and detailed build information.

### 5.23.4.2 `v2x_status_enum_type v2x_vehicle_get_static_params ( static_vehicle_↔ parameters_t * parameters )`

Returns (via a reference pointer) the `static_vehicle_parameters_t` structure that enumerates static (unchanging) data items used by ITS stacks.

#### Associated data types

`static_vehicle_parameters_t`

#### Parameters

out	<i>parameters</i>	Pointer to the static vehicle parameters, including vehicle dimensions, make, model, and so on.
-----	-------------------	---

#### Detailed description

This call is a nonblocking call. If the values are not yet available from the vehicle, the data element is 0 (NULL).

Because this function is sometimes populated with data from an in-vehicle network, it might be incomplete and only partially populated early in a system start-up. However, all values can be statically compiled in or loaded from an initialization file. In this case, the data is fully provided on the first call.

#### Returns

`V2X_STATUS_SUCCESS` – This function is successfully populated with the results.

Error code – If there is a problem (see `v2x_status_enum_type`).

### 5.23.4.3 `v2x_motion_data_handle_t v2x_high_res_motion_register_listener ( v2x_high_res_motion_listener_t cb )`

Registers for high-resolution motion callbacks from the vehicle data network (CAN bus) when the data changes.

#### Associated data types

[v2x\\_high\\_res\\_motion\\_listener\\_t](#)

#### Parameters

<code>in</code>	<code>cb</code>	Callback function to use for this listener.
-----------------	-----------------	---

#### Returns

Handle number to use with subsequent deregister calls.

-1 – If there is an error in registering a callback.

### 5.23.4.4 `v2x_status_enum_type v2x_high_res_motion_deregister_listener ( v2x_motion_data_handle_t handle )`

Deregisters a previously registered high-resolution motion data callback that was requested via [v2x\\_high\\_res\\_motion\\_register\\_listener\(\)](#).

#### Associated data types

[v2x\\_motion\\_data\\_handle\\_t](#)

#### Parameters

<code>in</code>	<code>handle</code>	Handle of the listener callback previously set up.
-----------------	---------------------	--

#### Returns

[V2X\\_STATUS\\_SUCCESS](#).

#### Dependencies

The callback must have been previously registered with [v2x\\_high\\_res\\_motion\\_register\\_listener\(\)](#).

#### 5.23.4.5 `v2x_vehicle_handle_t v2x_vehicle_register_listener ( v2x_vehicle_event_listener_t cb, void * context )`

Registers for a callback for state updates from the vehicle data network (CAN bus). This function requests vehicle data callbacks when data changes or events occur.

##### Associated data types

[v2x\\_vehicle\\_event\\_listener\\_t](#)

##### Parameters

in	<i>cb</i>	Callback function to use for this listener.
in	<i>context</i>	Pointer to the application context for use with the callbacks, which can help the caller code.

##### Returns

Handle number to use with subsequent deregister calls.

-1 – If there is an error in registering a callback.

#### 5.23.4.6 `v2x_status_enum_type v2x_vehicle_deregister_for_callback ( v2x_vehicle_handle_t handle )`

Deregisters a previously registered dynamic event callback that was requested via [v2x\\_vehicle\\_register\\_listener\(\)](#).

##### Associated data types

[v2x\\_vehicle\\_handle\\_t](#)

##### Parameters

in	<i>handle</i>	Handle of the listener callback previously set up.
----	---------------	--

##### Returns

[V2X\\_STATUS\\_SUCCESS](#) – If the callback is successfully deregistered.

##### Dependencies

The callback must have been previously registered.

## 5.24 C Config APIs

This section contains C Config APIs related to Cellular-V2X operation. These APIs are provided as an abstraction of the CV2X configuration relevant interfaces.

Abstraction of the CV2X configuration relevant interfaces.

### 5.24.1 Data Structure Documentation

#### 5.24.1.1 struct v2x\_config\_event\_info\_t

Information about any update to a V2X config file.

##### Data fields

Type	Field	Description
<a href="#">v2x_config_source_t</a>	source	The type of the V2X config file.
<a href="#">v2x_config_event_t</a>	event	Config file event.

## 5.24.2 Enumeration Type Documentation

### 5.24.2.1 enum v2x\_config\_soure\_t

V2X configuration source types listed in ascending order of priority. The system always uses the V2X configuration with the highest priority if multiple V2X configuration sources exist.

#### Enumerator

**V2X\_CONFIG\_SOURCE\_UNKNOWN** V2X config file source is unknown  
**V2X\_CONFIG\_SOURCE\_PRECONFIG** V2X config file source is preconfig  
**V2X\_CONFIG\_SOURCE\_SIM\_CARD** V2X config file source is SIM card  
**V2X\_CONFIG\_SOURCE\_OMA\_DM** V2X config file source is OMA-DM

### 5.24.2.2 enum v2x\_config\_event\_t

Events relevant to CV2X config file.

#### Enumerator

**V2X\_CONFIG\_EVENT\_CHANGED** V2X config file is changed  
**V2X\_CONFIG\_EVENT\_EXPIRED** V2X config file is expired

## 5.24.3 Function Documentation

### 5.24.3.1 v2x\_status\_enum\_type v2x\_register\_for\_config\_change\_ind ( cv2x\_config↔ \_event\_listener callback )

Register listener for any updates to CV2X configuration.

#### Associated data types

cv2x\_config\_event\_listener

#### Parameters

in	<i>callback</i>	Callback function of <a href="#">cv2x_config_event_listener</a> structure that is used during CV2X config events (such as CV2X configuration expriy or changed).
----	-----------------	--

#### Detailed description

This function should be called before calling [v2x\\_update\\_configuration](#) or [v2x\\_request\\_configuration](#) if the caller has interest in the notification of V2X configuration events.

**V2X\_CONFIG\_EVENT\_CHANGED** [v2x\\_config\\_event\\_t](#) is sent to registered CV2X configuration listeners if the content of the active V2X configuration file is changed by calling [v2x\\_update\\_configuration](#) or the active V2X configuration file source [v2x\\_config\\_soure\\_t](#) is changed from one type to another.

V2X\_CONFIG\_EVENT\_EXPIRED [v2x\\_config\\_event\\_t](#) is sent to registered CV2X configuration listeners when the active V2X configuration file is expired.

**Returns**

[V2X\\_STATUS\\_SUCCESS](#).

[V2X\\_STATUS\\_FAIL](#) – If there is an error.

### 5.24.3.2 `v2x_status_enum_type v2x_update_configuration ( const char * config_file_path )`

Updates the OMA-DM V2X radio configuration file.

#### Parameters

in	<code>config_file_path</code>	Pointer to the path of the configuration file.
----	-------------------------------	--

#### Detailed description

The V2X radio status must be INACTIVE. If the V2X status is ACTIVE or SUSPENDED (see [v2x\\_event\\_t](#)), call `stop_v2x_mode()` first.

The functionality of V2X configuration expiration is supported by adding an expiration leaf to the V2X configuration file passed in. When the active configuration expires, the system fallbacks to a lower priority V2X configuration [v2x\\_config\\_source\\_t](#) if existed. If the V2X status is active, it changes to suspended when the active V2X configuration expires and then changes to active after the system fallbacks to a lower priority V2X configuration or changes to inactive if no V2X configuration is available.

This call is a blocking call. When it returns the configuration has been updated, assuming no error.

#### Returns

[V2X\\_STATUS\\_SUCCESS](#).

Otherwise:

- [V2X\\_STATUS\\_EALREADY](#) – Failure because V2X status is not [V2X\\_INACTIVE](#).
- [V2X\\_STATUS\\_FAIL](#) – Other failure.

#### Dependencies

V2X radio status must be [V2X\\_INACTIVE](#) ([v2x\\_event\\_t](#)).

### 5.24.3.3 `v2x_status_enum_type v2x_retrieve_configuration ( const char * config_file_path )`

Retrieve the V2X radio configuration file.

#### Parameters

in	<code>config_file_path</code>	Pointer to the path of the configuration file.
----	-------------------------------	--

This call is a blocking call. When it returns the configuration has been read out, assuming no error.

#### Returns

[V2X\\_STATUS\\_SUCCESS](#).

Otherwise:

- [V2X\\_STATUS\\_FAIL](#) – Other failure.

## 5.25 C Packet APIs

This section contains C Packet APIs related to Cellular-V2X packet analysis operation.

Provide utilities and structures for CV2X packet analysis.

### 5.25.1 Define Documentation

#### 5.25.1.1 #define META\_DATA\_MASK\_SFN 0x01

meta data validity mask of each received packet, used by [rx\\_packet\\_meta\\_data\\_t](#)

#### 5.25.1.2 #define META\_DATA\_MASK\_SUB\_CHANNEL\_INDEX 0x02

#### 5.25.1.3 #define META\_DATA\_MASK\_SUB\_CHANNEL\_NUM 0x04

#### 5.25.1.4 #define META\_DATA\_MASK\_PRX\_RSSI 0x08

#### 5.25.1.5 #define META\_DATA\_MASK\_DRX\_RSSI 0x10

#### 5.25.1.6 #define META\_DATA\_MASK\_L2\_DEST 0x20

#### 5.25.1.7 #define META\_DATA\_MASK\_SCI\_FORMAT1 0x40

#### 5.25.1.8 #define META\_DATA\_MASK\_DELAY\_ESTI 0x80

### 5.25.2 Data Structure Documentation

#### 5.25.2.1 struct rx\_packet\_meta\_data\_t

Contains the detailed meta data report of a packet received.

##### Data fields

Type	Field	Description
uint32_t	validity	Validity of the meta data
uint16_t	sfn	System Frame Number * 10 + subframe number
uint8_t	sub_channel_↔ index	The subchannel used for transmission
uint8_t	sub_channel_↔ num	Number of subchannels in the Rx pool
int8_t	prx_rssi	RSSI of primary receive signal, in dBm
int8_t	drx_rssi	RSSI of diversity receive signal, in dBm
uint32_t	l2_↔ destination_id	L2 destination ID
uint32_t	sci_format1_↔ info	SCI format1, 3GPP TS 36.213 section 14.1
int32_t	delay_↔ estimation	Packet delay estimation, in Ts (1/(15000 * 2048) seconds)

## 5.25.3 Function Documentation

### 5.25.3.1 `v2x_status_enum_type v2x_parse_rx_meta_data ( const uint8_t * payload, uint32_t length, rx_packet_meta_data_t * meta_data, size_t * num, size_t * meta_data_len )`

Parse the received packet's meta data from the payload

#### Associated data types

`#rx_packets_meta_data_t`

#### Parameters

in	<i>payload</i>	Pointer to the received message which may contains the meta data reports
in	<i>length</i>	Length of the received message in byte
out	<i>meta_data</i>	Pointer to the meta data structure array
in, out	<i>num</i>	array size of meta_data as input, be assigned to the number of meta data reports parsed out. The caller can use this value to index the array meta_data.
out	<i>meta_data_len</i>	length of the meta data in byte parsed out from the payload

#### Detailed description

This function extracts the received packet's meta data from the payload, there maybe several meta data reports in the received payload.

#### Returns

[V2X\\_STATUS\\_SUCCESS](#).

Otherwise:

- [V2X\\_STATUS\\_FAIL](#) – Other failure.

## 5.26 CPP APIs

This section contains C++ APIs related to Cellular-V2X operation. Applications need to have "radio" Linux group permissions to be able to operate successfully with underlying services.

•

### 5.26.1 Data Structure Documentation

#### 5.26.1.1 class telux::cv2x::ICv2xConfigListener

Listeners for [ICv2xConfig](#) must implement this interface.

##### Public member functions

- virtual void [onConfigChanged](#) (const [ConfigEventInfo](#) &info)
- virtual [~ICv2xConfigListener](#) ()

##### 5.26.1.1.1 Constructors and Destructors

###### 5.26.1.1.1.1 virtual telux::cv2x::ICv2xConfigListener::~~ICv2xConfigListener ( ) [virtual]

Destructor for [ICv2xConfigListener](#)

##### 5.26.1.1.2 Member Function Documentation

###### 5.26.1.1.2.1 virtual void telux::cv2x::ICv2xConfigListener::onConfigChanged ( const [ConfigEventInfo](#) & *info* ) [virtual]

Called when CV2X configuration has changed in the below scenarios:

1. The specified configuration source has expired.
2. The active configuration source has changed to the specified configuration source type due to the expiration of the configuration source being used.
3. The specified configuration source has been updated.

##### Parameters

in	<i>info</i>	- Information of CV2X configuration event.
----	-------------	--

#### 5.26.1.2 class telux::cv2x::ICv2xConfig

Cv2xConfig provide operations to update or request [cv2x](#) configuration.

**Public member functions**

- virtual `~ICv2xConfig ()`
- virtual `bool isReady ()=0`
- virtual `std::future< bool > onReady ()=0`
- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `telux::common::Status updateConfiguration (const std::string &configFilePath, telux::common::ResponseCallback cb)=0`
- virtual `telux::common::Status retrieveConfiguration (const std::string &configFilePath, telux::common::ResponseCallback cb)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< ICv2xConfigListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< ICv2xConfigListener > listener)=0`

**5.26.1.2.1 Constructors and Destructors**

**5.26.1.2.1.1** `virtual telux::cv2x::ICv2xConfig::~~ICv2xConfig ( ) [virtual]`

**5.26.1.2.2 Member Function Documentation**

**5.26.1.2.2.1** `virtual bool telux::cv2x::ICv2xConfig::isReady ( ) [pure virtual]`

Checks if the Cv2x Config Manager is ready.

**Returns**

True if Cv2x Config is ready for service, otherwise returns false.

**Deprecated** use `getServiceStatus` instead

**5.26.1.2.2.2** `virtual std::future<bool> telux::cv2x::ICv2xConfig::onReady ( ) [pure virtual]`

Wait for Cv2x Config to be ready.

**Returns**

A future that caller can wait on to be notified when Cv2x Radio Manager is ready.

**Deprecated** the readiness can be notified via the callback passed to `Cv2xFactory::getCv2xConfig`.

### 5.26.1.2.2.3 `virtual telux::common::ServiceStatus telux::cv2x::ICv2xConfig::getServiceStatus ( )` [pure virtual]

This status indicates whether the Cv2xConfig is in a usable state.

#### Returns

SERVICE\_AVAILABLE - If `cv2x` config is ready for service. SERVICE\_UNAVAILABLE - If `cv2x` config is temporarily unavailable. SERVICE\_FAILED - If `cv2x` config encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.26.1.2.2.4 `virtual telux::common::Status telux::cv2x::ICv2xConfig::updateConfiguration ( const std::string & configFilePath, telux::common::ResponseCallback cb )` [pure virtual]

Updates CV2X configuration. Requires CV2X TX/RX radio status be Inactive. If CV2X radio status is Active or Suspended, call `ICv2xRadioManager::stopCv2x` before trying to update configuration. The functionality of V2X configuration expiration is supported by adding an expiration leaf to the V2X configuration file passed in. When the active configuration expires, the system fallbacks to a lower priority V2X configuration `ConfigSourceType` if existed. If the V2X status is active, it changes to suspended when the active V2X configuration expires and then changes to active after the system fallbacks to a lower priority V2X configuration or changes to inactive if no V2X configuration is available.

#### Parameters

in	<i>configFilePath</i>	- Path to config file. This is the fully qualified file path including the name of the file.
in	<i>cb</i>	- Callback that is invoked when the send is complete. This may be null.

### 5.26.1.2.2.5 `virtual telux::common::Status telux::cv2x::ICv2xConfig::retrieveConfiguration ( const std::string & configFilePath, telux::common::ResponseCallback cb )` [pure virtual]

Retrieve active CV2X configuration. The calling application should have write access to the path specified by `.` And if the v2x configuration retrieval request succeed, the file specified by `will` be created and filled with the configuration contents. Otherwise, no file will be created.

#### Parameters

in	<i>configFilePath</i>	- Path to config file. This is the fully qualified file path including the name of the file.
in	<i>cb</i>	- Callback that is invoked when the configuration retrieval is complete. This may be null.

**5.26.1.2.2.6** `virtual telux::common::Status telux::cv2x::ICv2xConfig::registerListener ( std::weak_ptr< ICv2xConfigListener > listener ) [pure virtual]`

Registers a listener for this [ICv2xConfig](#).

#### Parameters

in	<i>listener</i>	- Listener that implements <a href="#">ICv2xConfigListener</a> interface.
----	-----------------	---

**5.26.1.2.2.7** `virtual telux::common::Status telux::cv2x::ICv2xConfig::deregisterListener ( std::weak_ptr< ICv2xConfigListener > listener ) [pure virtual]`

Deregisters a listener for this [ICv2xConfig](#).

#### Parameters

in	<i>listener</i>	- Previously registered <a href="#">ICv2xConfigListener</a> that is to be deregistered.
----	-----------------	---

### 5.26.1.3 class telux::cv2x::Cv2xFactory

[Cv2xFactory](#) is the factory that creates the Cv2x Radio.

#### Public member functions

- virtual `std::shared_ptr< ICv2xRadioManager > getCv2xRadioManager (telux::common::InitResponseCb cb=nullptr)`
- virtual `std::shared_ptr< ICv2xConfig > getCv2xConfig (telux::common::InitResponseCb cb=nullptr)`
- virtual `std::shared_ptr< ICv2xThrottleManager > getCv2xThrottleManager (telux::common::InitResponseCb cb=nullptr)`

#### Static Public Member Functions

- static `Cv2xFactory & getInstance ()`

#### Protected Member Functions

- `Cv2xFactory ()`
- virtual `~Cv2xFactory ()`

#### 5.26.1.3.1 Constructors and Destructors

**5.26.1.3.1.1** `telux::cv2x::Cv2xFactory::Cv2xFactory ( ) [protected]`

**5.26.1.3.1.2** virtual telux::cv2x::Cv2xFactory::~~Cv2xFactory ( ) [protected], [virtual]

### 5.26.1.3.2 Member Function Documentation

**5.26.1.3.2.1** static Cv2xFactory& telux::cv2x::Cv2xFactory::getInstance ( ) [static]

Get [Cv2xFactory](#) instance

#### Returns

Reference to [Cv2xFactory](#) singleton.

**5.26.1.3.2.2** virtual std::shared\_ptr<ICv2xRadioManager> telux::cv2x::Cv2xFactory::getCv2xRadioManager ( telux::common::InitResponseCb *cb* = nullptr ) [virtual]

Get Cv2xRadioManager instance.

#### Parameters

in	<i>cb</i>	- Optional callback to get Cv2xRadioManager initialization status
----	-----------	---

#### Returns

shared pointer to Cv2x Radio Manager upon success. nullptr otherwise.

**5.26.1.3.2.3** virtual std::shared\_ptr<ICv2xConfig> telux::cv2x::Cv2xFactory::getCv2xConfig ( telux::common::InitResponseCb *cb* = nullptr ) [virtual]

Get Cv2xConfig instance.

#### Parameters

in	<i>cb</i>	- Optional callback to get Cv2xConfig initialization status
----	-----------	---

#### Returns

shared pointer to Cv2x Config upon success. nullptr otherwise.

**5.26.1.3.2.4** virtual std::shared\_ptr<ICv2xThrottleManager> telux::cv2x::Cv2xFactory::getCv2xThrottleManager ( telux::common::InitResponseCb *cb* = nullptr ) [virtual]

Get Cv2xThrottleManager instance.

#### Returns

shared pointer to Cv2x ThrottleManager upon success. nullptr otherwise.

### 5.26.1.4 class telux::cv2x::ICv2xRadio

This class encapsulates a Cv2xRadio interface.

Returned from getCv2xRadio in [Cv2xFactory](#)

#### Public member functions

- virtual [Cv2xRadioCapabilities](#) getCapabilities () const =0
- virtual bool isReady () const =0
- virtual bool isInitialized () const =0

- virtual `telux::common::Status createCv2xTcpSocket (const EventFlowInfo &eventInfo, const SocketInfo &sockInfo, CreateTcpSocketCallback cb)=0`
- virtual `telux::common::Status closeCv2xTcpSocket (std::shared_ptr< ICv2xTxRxSocket > sock, CloseTcpSocketCallback cb)=0`
- virtual `telux::common::Status registerTxStatusReportListener (uint16_t port, std::shared_ptr< ICv2xTxStatusReportListener > listener, telux::common::ResponseCallback cb)=0`
- virtual `telux::common::Status deregisterTxStatusReportListener (uint16_t port, telux::common::ResponseCallback cb)=0`
- virtual `telux::common::Status setGlobalIPInfo (const IPv6AddrType &ipv6Addr, common::ResponseCallback cb)=0`
- virtual `telux::common::Status setGlobalIPUnicastRoutingInfo (const GlobalIPUnicastRoutingInfo &destL2Addr, common::ResponseCallback cb)=0`

#### 5.26.1.4.1 Constructors and Destructors

5.26.1.4.1.1 `virtual telux::cv2x::!Cv2xRadio::~!Cv2xRadio ( ) [virtual]`

Destructor for [ICv2xRadio](#)

#### 5.26.1.4.2 Member Function Documentation

5.26.1.4.2.1 `virtual Cv2xRadioCapabilities telux::cv2x::!Cv2xRadio::getCapabilities ( ) const [pure virtual]`

Get the capabilities of this Cv2xRadio.

##### Returns

[Cv2xRadioCapabilities](#) - Contains capabilities of this Cv2xRadio.

**Deprecated** Use [requestCapabilities\(\)](#) API

5.26.1.4.2.2 `virtual bool telux::cv2x::!Cv2xRadio::isReady ( ) const [pure virtual]`

Returns true if the radio interface was successfully initialized.

##### Returns

True if ready. False otherwise.

#### 5.26.1.4.2.3 `virtual bool telux::cv2x::ICv2xRadio::isInitialized ( ) const [pure virtual]`

Returns true if the radio interface has completed initialization.

#### Returns

True if initialized. False otherwise.

#### 5.26.1.4.2.4 `virtual std::future<telux::common::Status> telux::cv2x::ICv2xRadio::onReady ( ) [pure virtual]`

Returns a future that indicated if the radio interface is ready or if radio failed to initialize.

#### Returns

SUCCESS if Cv2xRadio initialization was successful. Otherwise it returns an Error Code.

#### 5.26.1.4.2.5 `virtual telux::common::Status telux::cv2x::ICv2xRadio::registerListener ( std::weak_ptr<ICv2xRadioListener > listener ) [pure virtual]`

Registers a listener for this Cv2xRadio.

#### Parameters

in	<i>listener</i>	- Listener that implements Cv2xRadioListener interface.
----	-----------------	---

#### 5.26.1.4.2.6 `virtual telux::common::Status telux::cv2x::ICv2xRadio::deregisterListener ( std::weak_ptr<ICv2xRadioListener > listener ) [pure virtual]`

Deregisters a listener from this Cv2xRadio.

#### Parameters

in	<i>listener</i>	- Previously registered Cv2xRadioListener that is to be deregistered.
----	-----------------	---

#### 5.26.1.4.2.7 `virtual telux::common::Status telux::cv2x::ICv2xRadio::createRxSubscription ( TrafficType ipType, uint16_t port, CreateRxSubscriptionCallback cb, std::shared_ptr<std::vector<uint32_t >> idList = nullptr ) [pure virtual]`

Creates and initializes a new Rx subscription which will be returned in the user-supplied callback.

#### Parameters

in	<i>ipType</i>	- IP traffic type (IP or NON-IP)
in	<i>port</i>	- Rx port number
in	<i>cb</i>	- Callback function that is invoked when socket creation is complete.

in	<i>idList</i>	- Service ID list to subscribe, optional parameter using nullptr by default. Subscribe wildcard if this parameter is set to nullptr.
----	---------------	--

### Returns

SUCCESS on success. Error status otherwise.

**Dependencies** The interface must be pre-initialized with `init()`.

**5.26.1.4.2.8** `virtual telux::common::Status telux::cv2x::ICv2xRadio::enableRxMetaDataReport ( TrafficIpType ipType, bool enable, std::shared_ptr< std::vector< std::uint32_t >> idList, telux::common::ResponseCallback cb ) [pure virtual]`

Enable or disable (depends on the parameter "bool enable") the received packets' meta data report for the service IDs provided.

The meta data consist of RF RSSI (received signal strength indicator) status, 32-bit SCI Format 1 (3GPP TS 36.213, section 14.1), packet delay estimation, L2 destination ID, and the resource blocks used for the packet's transmission: subframe, subchannel index.

### Parameters

in	<i>ipType</i>	- IP traffic type (IP or NON-IP)
in	<i>enable</i>	- enable the rx meta data if set to true, otherwise disable
in	<i>idList</i>	- Service ID list of which the received packets' report are desired
in	<i>cb</i>	- Callback that is invoked when meta data is enabled or disabled.

### Returns

SUCCESS if no error occurred

**Meta data report for IP packets is not supported yet, it will return NOSUPPORTED.**

**5.26.1.4.2.9** `virtual telux::common::Status telux::cv2x::ICv2xRadio::createTxSpsFlow ( TrafficIpType ipType, uint32_t serviceId, const SpsFlowInfo & spsInfo, uint16_t spsSrcPort, bool eventSrcPortValid, uint16_t eventSrcPort, CreateTxSpsFlowCallback cb ) [pure virtual]`

Creates a Tx SPS flow with the specified IP type, serviceId, and other parameters specified in reservation. Additionally, an option event flow will be created with the same IP type and serviceId. A Tx socket will be created and initialized for the SPS flow. A Tx socket will be created and initialized for the event flow if the optional event flow is specified.

in	<i>ipType</i>	- IP traffic type (IP or NON-IP)
in	<i>serviceId</i>	- ID used for transmissions that will be mapped to an L2 destination address. Variable length 4-byte PSID or ITS_AID, or another service ID.
in	<i>spsInfo</i>	- SPS reservation parameters.
in	<i>spsPort</i>	- Requested source port number for the bandwidth reserved SPS transmissions.
in	<i>eventSrcPortValid</i>	- True if an optional event flow is desired. If this field is left false, the event flow will not be created.
in	<i>eventSrcPort</i>	- Requested source port number for the optional event flow.
in	<i>cb</i>	- Callback function that is invoked when socket creation is complete. This must not be null.

**This caller is expected to identify two unused local port numbers**

to use for binding: one for the event-driven flow and one for the SPS flow.

**Returns**

SUCCESS upon success. Error status otherwise.

**5.26.1.4.2.10 virtual telux::common::Status telux::cv2x::ICv2xRadio::createTxEventFlow ( TrafficIpType ipType, uint32\_t serviceId, uint16\_t eventSrcPort, CreateTxEventFlowCallback cb ) [pure virtual]**

Creates an event flow. An associated Tx socket will be created and initialized.

**Parameters**

in	<i>ipType</i>	- IP traffic type (IP or NON-IP)
in	<i>serviceId</i>	- ID used for transmissions that will be mapped to an L2 destination address. Variable length 4-byte PSID or ITS_AID, or another service ID.
in	<i>eventSrcPort</i>	- Local port number to which the socket is bound. Used for transmissions of this ID.
in	<i>cb</i>	- Callback function that is invoked when socket creation is complete. This must not be null.

**Detailed description This function is used only for TX when no periodicity is**

available for the application type. If your transmit data periodicity is known, use [createTxSpsFlow\(\)](#) instead.

**These even-driven sockets pay attention to the QoS parameters in**

the IP socket.

**Returns**

SUCCESS upon success. Error status otherwise.

**5.26.1.4.2.11** `virtual telux::common::Status telux::cv2x::ICv2xRadio::createTxEventFlow ( TrafficIpType ipType, uint32_t serviceId, const EventFlowInfo & flowInfo, uint16_t eventSrcPort, CreateTxEventFlowCallback cb ) [pure virtual]`

Creates an event flow. An associated Tx socket will be created and initialized.

#### Parameters

in	<i>ipType</i>	- IP traffic type (IP or NON-IP)
in	<i>serviceId</i>	- ID used for transmissions that will be mapped to an L2 destination address. Variable length 4-byte PSID or ITS_AID, or another service ID.
in	<i>flowInfo</i>	- Flow configuration parameters
in	<i>eventSrcPort</i>	- Local port number to which the socket is bound. Used for transmissions of this ID.
in	<i>cb</i>	- Callback function that is invoked when socket creation is complete. This must not be null.

**Detailed description** This function is used only for TX when no periodicity is

available for the application type. If your transmit data periodicity is known, use [createTxSpsFlow\(\)](#) instead.

**These even-driven sockets pay attention to the QoS parameters in**

the IP socket.

#### Returns

SUCCESS upon success. Error status otherwise.

**5.26.1.4.2.12** `virtual telux::common::Status telux::cv2x::ICv2xRadio::closeRxSubscription ( std::shared_ptr< ICv2xRxSubscription > rxSub, CloseRxSubscriptionCallback cb ) [pure virtual]`

Closes the RxSubscription and frees resources (such as the Rx socket) associated with it.

#### Parameters

in	<i>rxSub</i>	- RxSubscription to close
in	<i>cb</i>	- Callback that is invoked when socket close is complete. This may be null.

#### Returns

SUCCESS if no error occurred.

**5.26.1.4.2.13 virtual telux::common::Status telux::cv2x::ICv2xRadio::closeTxFlow ( std::shared\_ptr< ICv2xTxFlow > *txFlow*, CloseTxFlowCallback *cb* ) [pure virtual]**

Closes the TxFlow and frees resources associated with it (such as reserved SPS bandwidth contracts and sockets). This function works on both SPS and event flows.

**Parameters**

in	<i>txFlow</i>	- Tx (SPS or event) flow to close.
in	<i>cb</i>	- Callback that is invoked when Tx flow close is complete. This may be null.

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.14 virtual telux::common::Status telux::cv2x::ICv2xRadio::changeSpsFlowInfo ( std::shared\_ptr< ICv2xTxFlow > *txFlow*, const SpsFlowInfo & *spsInfo*, ChangeSpsFlowInfoCallback *cb* ) [pure virtual]**

Request to change TX SPS Flow reservation parameters.

**Parameters**

in	<i>txFlow</i>	- Tx SPS flow
in	<i>spsInfo</i>	- Desired SPS reservation parameters
in	<i>cb</i>	- Callback that is invoked upon reservation change. This may be null.

**Detailed description**

This function does not update reservation priority

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.15 virtual telux::common::Status telux::cv2x::ICv2xRadio::requestSpsFlowInfo ( std::shared\_ptr< ICv2xTxFlow > *txFlow*, RequestSpsFlowInfoCallback *cb* ) [pure virtual]**

Request SPS flow info.

**Parameters**

in	<i>sock</i>	- Tx SPS flow
in	<i>cb</i>	- Callback that will be invoked and returns the SPS info. Must not be null.

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.16 virtual telux::common::Status telux::cv2x::ICv2xRadio::changeEventFlowInfo ( std::shared\_ptr< ICv2xTxFlow > *txFlow*, const EventFlowInfo & *flowInfo*, ChangeEventFlowInfoCallback *cb* ) [pure virtual]**

Request to change TX Event Flow reservation parameters.

**Parameters**

in	<i>txFlow</i>	- Tx Event flow
in	<i>flowInfo</i>	- Desired Event flow parameters
in	<i>cb</i>	- Callback that is invoked upon parameter change. This may be null.

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.17 virtual telux::common::Status telux::cv2x::ICv2xRadio::requestCapabilities ( RequestCapabilitiesCallback *cb* ) [pure virtual]**

Request modem Cv2x capability information.

**Parameters**

in	<i>cb</i>	- Callback that will be invoked and returns the capability info. Must not be null.
----	-----------	--

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.18 virtual telux::common::Status telux::cv2x::ICv2xRadio::requestDataSessionSettings ( RequestDataSessionSettingsCallback *cb* ) [pure virtual]**

Request data session settings currently in use.

**Parameters**

in	<i>cb</i>	- Callback that will be invoked and returns the data session settings. Must not be null.
----	-----------	--

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.19 virtual telux::common::Status telux::cv2x::ICv2xRadio::updateSrcL2Info ( UpdateSrcL2InfoCallback *cb* ) [pure virtual]**

Requests modem to change L2 info.

**Parameters**

in	<i>cb</i>	- Callback that will be invoked and returns status. Must not be null.
----	-----------	---

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.20 virtual telux::common::Status telux::cv2x::ICv2xRadio::updateTrustedUEList ( const TrustedUEInfoList & *infoList*, UpdateTrustedUEListCallback *cb* ) [pure virtual]**

Send request to modem to update the list of malicious UE source IDs and trusted UE source IDs with corresponding confidence information.

**Parameters**

in	<i>infoList</i>	- Trusted and malicious UE information list
in	<i>cb</i>	- Callback that will be invoked and returns status. Must not be null.

**Returns**

SUCCESS if no error occurred.

**5.26.1.4.2.21 virtual std::string telux::cv2x::ICv2xRadio::getInterfaceNameFromIpType ( TrafficIpType *ipType* ) [pure virtual]**

Get interface name based on ipType.

**Parameters**

<i>ipType</i>	- IP traffic type (IP or NON-IP)
---------------	----------------------------------

**Returns**

Interface name as a string

**5.26.1.4.2.22 virtual telux::common::Status telux::cv2x::ICv2xRadio::createCv2xTcpSocket ( const EventFlowInfo & *eventInfo*, const SocketInfo & *sockInfo*, CreateTcpSocketCallback *cb* ) [pure virtual]**

Creates a CV2X TCP socket with specified event flow information and TCP socket information. The TCP socket will be created and bound to the IPv6 address of local IP interface with specified source port.

Additionally, this API also registers a Tx event flow and subscribes Rx with specified service ID. If the created socket is expected to work as TCP client mode, the caller must connect the created socket to a destination using `connect()` and then use the socket for `send()` and `recv()` on successful connection. If the created socket is expected to work as TCP server mode, the caller must mark this socket as a listening socket using `listen()` and accept connections received from this listening socket using `accept()`, and then use the accepted sockets returned from `accept()` for `send()` or `recv()`.

### Parameters

in	<i>eventInfo</i>	- Information for the Event flow.
in	<i>sockInfo</i>	- Information for the TCP socket.
in	<i>cb</i>	- Callback function that is invoked when socket creation is complete. This must not be null.

### The caller is expected to identify an unused local port number as the source

port number in structure [SocketInfo](#) to use for binding.

### The caller must release the created socket and associated resources with

[closeCv2xTcpSocket](#). Additionally, if the created socket is marked as a listening socket, the caller must close all the accepted sockets returned by `accept()` using `close()` first, and then release the listening socket and associated resources by calling [closeCv2xTcpSocket](#).

### Returns

SUCCESS upon success. Error status otherwise.

**5.26.1.4.2.23** `virtual telux::common::Status telux::cv2x::ICv2xRadio::closeCv2xTcpSocket ( std::shared_ptr< ICv2xTxRxSocket > sock, CloseTcpSocketCallback cb ) [pure virtual]`

Closes the CV2X TCP socket and frees resources associated with it (such as registered event Tx flow and subscribed Rx service ID and created TCP socket).

### Parameters

in	<i>sock</i>	- CV2X TCP socket to close.
in	<i>cb</i>	- Callback that is invoked when CV2X TCP socket close is complete. This may be null.

### Returns

SUCCESS if no error occurred.

**5.26.1.4.2.24** `virtual telux::common::Status telux::cv2x::ICv2xRadio::registerTxStatusReport↔  
Listener ( uint16_t port, std::shared_ptr< ICv2xTxStatusReportListener > listener,  
telux::common::ResponseCallback cb ) [pure virtual]`

Registers a listener for Tx status report.

#### Parameters

in	<i>port</i>	- Set this value to the port number of registered Tx Flow if user wants to receive Tx status report associated with its own Tx flow. If user wants to receive Tx status report associated with all Tx flows in system, set this value to 0.
in	<i>listener</i>	- Listener that implements <a href="#">ICv2xTxStatusReportListener</a> interface.
in	<i>cb</i>	- Callback that is invoked when the registration of CV2X Tx status report is complete.

**5.26.1.4.2.25** `virtual telux::common::Status telux::cv2x::ICv2xRadio::deregisterTxStatusReportListener  
( uint16_t port, telux::common::ResponseCallback cb ) [pure virtual]`

Deregisters a listener for Tx status report.

#### Parameters

in	<i>port</i>	- Port number of previously registered <a href="#">ICv2xTxStatusReport↔Listener</a> that is to be deregistered. If the listener is registered with port number 0, set this value to 0 to deregister the listener.
in	<i>cb</i>	- Callback that is invoked when the deregistration of CV2X Tx status report is complete.

**5.26.1.4.2.26** `virtual telux::common::Status telux::cv2x::ICv2xRadio::setGlobalIPInfo ( const  
IPv6AddrType & ipv6Addr, common::ResponseCallback cb ) [pure virtual]`

Set CV2X global IP address for the IP interface.

Use case and Precondition: OBU: Registers a TX/RX *NON IP* flow for receiving the signed WSA/WRA for IP session initiation; Once receives the IP prefix in the WDS/WRA from RSU, call this method.

RSU: Specifies its own global prefix via this method, and creates/composes WSA/WRA advertising the IP configs.

#### Parameters

in	<i>ipv6Addr</i>	- CV2X global IP address.
in	<i>cb</i>	- Callback that is invoked when set the global IP address complete. This may be null.

#### Returns

SUCCESS if no error occurred.

**5.26.1.4.2.27 virtual telux::common::Status telux::cv2x::ICv2xRadio::setGlobalIPUnicastRoutingInfo ( const GlobalIPUnicastRoutingInfo & destL2Addr, common::ResponseCallback cb ) [pure virtual]**

Set CV2X IP interface global IP unicast routing information.

Use case and Precondition: OBU: Registers a TX/RX *NON IP* flow for receiving the signed WSA/WRA for IP session initiation; Once receives the IP prefix in the WSA/WRA from RSU, call the [setGlobalIPInfo](#) method to update the ip interface with global IP; Now call this method to set the routing information with dest L2 addr negotiated in WSA/WRA.

RSU: Specifies its own global prefix via [setGlobalIPInfo](#), and creates/composes WSA/WRA advertising the IP configs; Now set routing information of its own via this method.

#### Parameters

in	<i>destL2Addr</i>	- CV2X destination L2 address for unicast routing purpose.
in	<i>cb</i>	- Callback that is invoked when set global IP unicast routing information complete. This may be null.

#### Returns

SUCCESS if no error occurred.

### 5.26.1.5 class telux::cv2x::ICv2xRadioListener

Listeners for Cv2xRadio must implement this interface.

#### Public member functions

- virtual void [onStatusChanged](#) (Cv2xStatus status)
- virtual void [onStatusChanged](#) (Cv2xStatusEx status)
- virtual void [onL2AddrChanged](#) (uint32\_t newL2Address)
- virtual void [onSpsOffsetChanged](#) (int spsId, [MacDetails](#) details)
- virtual void [onSpsSchedulingChanged](#) (const [SpsSchedulingInfo](#) &schedulingInfo)
- virtual void [onCapabilitiesChanged](#) (const [Cv2xRadioCapabilities](#) &capabilities)
- virtual [~ICv2xRadioListener](#) ()

#### 5.26.1.5.1 Constructors and Destructors

**5.26.1.5.1.1 virtual telux::cv2x::ICv2xRadioListener::~~ICv2xRadioListener ( ) [virtual]**

Destructor for [ICv2xRadioListener](#)

### 5.26.1.5.2 Member Function Documentation

#### 5.26.1.5.2.1 virtual void telux::cv2x::ICv2xRadioListener::onStatusChanged ( Cv2xStatus *status* ) [virtual]

Called when the status of the CV2X radio has changed.

##### Parameters

in	<i>status</i>	- CV2X radio status.
----	---------------	----------------------

**Deprecated** use onStatusChanged in Cv2xListener

#### 5.26.1.5.2.2 virtual void telux::cv2x::ICv2xRadioListener::onStatusChanged ( Cv2xStatusEx *status* ) [virtual]

Called when the status of the CV2X radio has changed.

##### Parameters

in	<i>status</i>	- CV2X radio status.
----	---------------	----------------------

**Deprecated** use onStatusChanged in Cv2xListener

#### 5.26.1.5.2.3 virtual void telux::cv2x::ICv2xRadioListener::onL2AddrChanged ( uint32\_t *newL2Address* ) [virtual]

Called when the L2 Address has changed.

##### Parameters

in	<i>newL2Address</i>	- The new L2 address.
----	---------------------	-----------------------

#### 5.26.1.5.2.4 virtual void telux::cv2x::ICv2xRadioListener::onSpsOffsetChanged ( int *spsId*, MacDetails *details* ) [virtual]

Called when SPS offset has changed.

##### Parameters

in	<i>spsId</i>	- SPS Id of the SPS flow
in	<i>details</i>	- new SPS MAC PHY details.

**Deprecated** use onSpsSchedulingChanged

### 5.26.1.5.2.5 virtual void telux::cv2x::ICv2xRadioListener::onSpsSchedulingChanged ( const SpsSchedulingInfo & *schedulingInfo* ) [virtual]

Called when SPS scheduling has changed.

#### Parameters

in	<i>schedulingInfo</i>	- SPS scheduling information .
----	-----------------------	--------------------------------

### 5.26.1.5.2.6 virtual void telux::cv2x::ICv2xRadioListener::onCapabilitiesChanged ( const Cv2xRadioCapabilities & *capabilities* ) [virtual]

Called when Cv2x radio capabilities have changed.

#### Parameters

in	<i>capabilities</i>	- Capabilities of the CV2X radio .
----	---------------------	------------------------------------

## 5.26.1.6 class telux::cv2x::ICv2xRadioManager

Cv2xRadioManager manages instances of Cv2xRadio.

#### Public member functions

- virtual bool [isReady](#) ()=0
- virtual std::future< bool > [onReady](#) ()=0

### 5.26.1.6.1 Constructors and Destructors

5.26.1.6.1.1 `virtual telux::cv2x::ICv2xRadioManager::~~ICv2xRadioManager ( ) [virtual]`

### 5.26.1.6.2 Member Function Documentation

5.26.1.6.2.1 `virtual bool telux::cv2x::ICv2xRadioManager::isReady ( ) [pure virtual]`

Checks if the Cv2x Radio Manager is ready.

#### Returns

True if Cv2x Radio Manager is ready for service, otherwise returns false.

**Deprecated** use `getServiceStatus` instead

5.26.1.6.2.2 `virtual std::future<bool> telux::cv2x::ICv2xRadioManager::onReady ( ) [pure virtual]`

Wait for Cv2x Radio Manager to be ready.

#### Returns

A future that caller can wait on to be notified when Cv2x Radio Manager is ready.

**Deprecated** the readiness can be notified via the callback passed to `Cv2xFactory::getCv2xRadioManager`.

5.26.1.6.2.3 `virtual telux::common::ServiceStatus telux::cv2x::ICv2xRadioManager::getServiceStatus ( ) [pure virtual]`

This status indicates whether the Cv2xRadioManager is in a usable state.

#### Returns

`SERVICE_AVAILABLE` - If `cv2x` radio manager is ready for service. `SERVICE_UNAVAILABLE` - If `cv2x` radio manager is temporarily unavailable. `SERVICE_FAILED` - If `cv2x` radio manager encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.26.1.6.2.4 virtual std::shared\_ptr<ICv2xRadio> telux::cv2x::ICv2xRadioManager::getCv2xRadio ( TrafficCategory *category* ) [pure virtual]**

Get Cv2xRadio instance

**Parameters**

<i>in</i>	<i>category</i>	- Specifies the category of the client application. This field is currently unused.
-----------	-----------------	---

**Returns**

Reference to Cv2xRadio interface that corresponds to the Cv2x Traffic Category specified.

**5.26.1.6.2.5 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::startCv2x ( StartCv2x↔ Callback *cb* ) [pure virtual]**

Put modem into CV2X mode.

**Parameters**

<i>in</i>	<i>cb</i>	- Callback that is invoked when Cv2x mode is started
-----------	-----------	--

**Returns**

SUCCESS on success. Error status otherwise.

**5.26.1.6.2.6 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::stopCv2x ( StopCv2x↔ Callback *cb* ) [pure virtual]**

Take modem out of CV2X mode

**Parameters**

<i>in</i>	<i>cb</i>	- Callback that is invoked when Cv2x mode is stopped
-----------	-----------	--

**Returns**

SUCCESS on success. Error status otherwise.

**5.26.1.6.2.7 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::requestCv2xStatus ( RequestCv2xStatusCallback *cb* ) [pure virtual]**

request CV2X status from modem

**Parameters**

<i>in</i>	<i>cb</i>	- Callback that is invoked when Cv2x status is retrieved
-----------	-----------	--

**Returns**

SUCCESS on success. Error status otherwise.

**Deprecated** use requestCv2xStatus(RequestCv2xCallbackEx)

**5.26.1.6.2.8 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::requestCv2xStatus ( RequestCv2xStatusCallbackEx *cb* ) [pure virtual]**

request CV2X status from modem

**Parameters**

in	<i>cb</i>	- Callback that is invoked when Cv2x status is retrieved
----	-----------	--

**Returns**

SUCCESS on success. Error status otherwise.

**5.26.1.6.2.9 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::registerListener ( std::weak\_ptr< ICv2xListener > *listener* ) [pure virtual]**

Registers a listener for this manager.

**Parameters**

in	<i>listener</i>	- Listener that implements Cv2xListener interface.
----	-----------------	--

**5.26.1.6.2.10 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::deregisterListener ( std::weak\_ptr< ICv2xListener > *listener* ) [pure virtual]**

Deregisters a Cv2xListener for this manager.

**Parameters**

in	<i>listener</i>	- Previously registered CvListener that is to be deregistered.
----	-----------------	--

**5.26.1.6.2.11 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::updateConfiguration ( const std::string & *configFilePath*, UpdateConfigurationCallback *cb* ) [pure virtual]**

Updates CV2X configuration. Requires CV2X TX/RX radio status be Inactive. If CV2X radio status is Active or Suspended, call [stopCv2x](#) before updateConfiguration.

**Parameters**

in	<i>configFilePath</i>	- Path to config file.
in	<i>cb</i>	- Callback that is invoked when the send is complete. This may be null.

**Deprecated** Use `ICv2xConfig` instead

**5.26.1.6.2.12** `virtual telux::common::Status telux::cv2x::ICv2xRadioManager::setPeakTxPower ( int8_t txPower, common::ResponseCallback cb ) [pure virtual]`

Set RF peak `cv2x` transmit power. This affects the power for all existing flows and for any flow created in the future

#### Parameters

in	<i>txPower</i>	- Desired global Cv2x peak tx power in dbm
in	<i>cb</i>	- Callback that is invoked when Cv2x peak tx power is set

#### Returns

SUCCESS on success. Error status otherwise.

**5.26.1.6.2.13** `virtual telux::common::Status telux::cv2x::ICv2xRadioManager::setL2Filters ( const std::vector< L2FilterInfo > & filterList, common::ResponseCallback cb ) [pure virtual]`

Request to install remote UE src L2 filters. This affects receiving of the UEs' packets in specified period with specified PPPP

#### Parameters

in	<i>filterList</i>	- remote UE src L2 Id, filter duration and PPPP list, max size 50
in	<i>cb</i>	- Callback that is invoked when the request is sent

#### Returns

SUCCESS on success. Error status otherwise.

**5.26.1.6.2.14** `virtual telux::common::Status telux::cv2x::ICv2xRadioManager::removeL2Filters ( const std::vector< uint32_t > & l2IdList, common::ResponseCallback cb ) [pure virtual]`

Remove the previously installed filters matching src L2 address list. Hence forth this would allow reception of packets from specified UE's

#### Parameters

in	<i>l2IdList</i>	- remote UE src L2 Id list, max size 50
in	<i>cb</i>	- Callback that is invoked when the request is sent

#### Returns

SUCCESS on success. Error status otherwise.

### 5.26.1.6.2.15 virtual telux::common::Status telux::cv2x::ICv2xRadioManager::getSlssRxInfo ( GetSlssRxInfoCallback *cb* ) [pure virtual]

Get CV2X SLSS Rx information from modem.

#### Parameters

in	<i>cb</i>	- Callback that is invoked when Cv2x SLSS Rx information is retrieved.
----	-----------	--

#### Returns

SUCCESS on success. Error status otherwise.

### 5.26.1.7 struct telux::cv2x::SyncRefUeInfo

Encapsulates parameters of an SLSS sync reference UE. Used in [SlssRxInfo](#).

#### Data fields

Type	Field	Description
uint16_t	slssId	The SLSS ID of the sync reference UE that is defined in 3GPP TS 36.331 chapter 6.3.8.
bool	inCoverage	Indicates whether or not the UE is in coverage of GNSS that is defined in 3GPP TS 36.331 chapter 6.5.2.
<a href="#">SlssSyncPattern</a>	pattern	Indicates the SLSS sync pattern of the UE that is defined in 3GPP TS 36.331 chapter 6.3.8.
uint8_t	rsrp	SLSS RSRP value of the UE in dBm is ((float)rsrp - 256)/2.
bool	selected	Indicates whether or not the sync reference UE has been selected as the timing source.

### 5.26.1.8 struct telux::cv2x::SlssRxInfo

Encapsulates parameters of CV2X SLSS Rx Information.

Used in [telux::cv2x::ICv2xListener::onSlssRxInfoChanged](#).

#### Data fields

Type	Field	Description
vector< <a href="#">SyncRefUeInfo</a> >	ueInfo	Vector of detected SLSS sync reference UEs.

### 5.26.1.9 struct telux::cv2x::SocketInfo

Encapsulates parameters of a CV2X socket.

Used in [createCv2xTcpSocket](#).

**Data fields**

Type	Field	Description
uint32_t	serviceId	V2X service ID bound to the socket.
uint16_t	localPort	Local port number of the socket used for binding.

**5.26.1.10 struct telux::cv2x::Cv2xStatus**

Encapsulates status of CV2X radio.

Used in Cv2xRadioManager:requestV2xStatus and Cv2xRadioListener.

**Data fields**

Type	Field	Description
<a href="#">Cv2xStatus</a> ↔ Type	rxStatus	RX status
<a href="#">Cv2xStatus</a> ↔ Type	txStatus	TX status
<a href="#">Cv2xCause</a> ↔ Type	rxCause	RX cause of failure
<a href="#">Cv2xCause</a> ↔ Type	txCause	TX cause of failure
uint8_t	cbrValue	Channel Busy Ratio
bool	cbrValueValid	CBR value is valid

**5.26.1.11 struct telux::cv2x::Cv2xPoolStatus**

Encapsulates status for single pool.

Used in [Cv2xStatusEx](#).

**Data fields**

Type	Field	Description
uint8_t	poolId	pool ID
<a href="#">Cv2xStatus</a>	status	status

**5.26.1.12 struct telux::cv2x::Cv2xStatusEx**

Encapsulates status of CV2X radio and per pool status.

Used in Cv2xRadioManager:requestV2xStatus and Cv2xRadioListener.

**Data fields**

Type	Field	Description
<a href="#">Cv2xStatus</a>	status	Overall Cv2x status
vector< <a href="#">Cv2xPool</a> ↔ <a href="#">Status</a> >	poolStatus	Multi pool status vector

Type	Field	Description
bool	time↔ Uncertainty↔ Valid	Time uncertainty value is valid
float	time↔ Uncertainty	Time uncertainty value in milliseconds

### 5.26.1.13 struct telux::cv2x::TxPoolIdInfo

Contains minimum and maximum EARFCNs for a given Tx pool ID. Multiple Tx Pools allow the same radio and overall frequency range to be shared for multiple types of traffic like V2V and V2X. Each pool ID and frequency range corresponds to a certain type of traffic. Both edge guard bands are not included in the EARFCN range reported. The calculation for the full bandwidth includes both edge guard bands is:  
 $\text{bandwidth(MHz)} = (\text{maxFreq} - \text{minFreq}) / 9$ .

Used in [Cv2xRadioCapabilities](#)

#### Data fields

Type	Field	Description
uint8_t	poolId	TX pool ID.
uint16_t	minFreq	Minimum EARFCN of this pool.
uint16_t	maxFreq	Maximum EARFCN of this pool.

### 5.26.1.14 struct telux::cv2x::EventFlowInfo

Contains event flow configuration parameters.

Used in `createTxEventFlow`

#### Data fields

Type	Field	Description
bool	autoRetrans↔ EnabledValid	Set to true if autoRetransEnabled field is specified. If false, the system will use the default setting.
bool	autoRetrans↔ Enabled	Used to enable automatic-retransmissions.
bool	peakTxPower↔ Valid	Set to true if peakTxPower is used. If false, the system will use the default setting.
int32_t	peakTxPower	Max Tx power setting in dBm.
bool	mcsIndexValid	Set to true if mcsIndex is used. If false, the system will use its default setting.
uint8_t	mcsIndex	Modulation and Coding Scheme Index to use.
bool	txPoolIdValid	Set to true if txPoolId is used. If false, the system will use its default setting.
uint8_t	txPoolId	Transmission Pool ID.
bool	isUnicast	Set to true if isUnicast flow. If false, Non-Unicast flow will be created. Note: Unicast flows ignore subscribed Service Ids

### 5.26.1.15 struct telux::cv2x::SpsFlowInfo

Used to request the QoS bandwidth contract, implemented in PC5 3GPP V2X radio as a *Semi Persistent Flow* (SPS).

The underlying radio providing the interface might support periodicities of various granularity in 100ms integer multiples (e.g. 200ms, 300ms).

Used in txSpsCreateAndBindSock and changeSpsFlowInfo

#### Data fields

Type	Field	Description
Priority	priority	Specifies one of the 3GPP levels of Priority for the traffic that is pre-reserved on the SPS flow. Default is PRIORITY_2. Use getCapabilities() to discover the supported priority levels. : periodicity, Use new periodicityMs instead
Periodicity	periodicity	
uint64_t	periodicityMs	This is the new interface to specify periodicity in milliseconds for SpsFlowInfo. Enum Periodicity is deprecated and will be removed in future release. Bandwidth-reserved periodicity interval in interval in milliseconds. There are limits on which intervals the underlying radio supports. Use getCapabilities() to discover minPeriodicityMultiplierMs and maximumPeriodicityMs.
uint32_t	nbytesReserved	Number of bytes of TX bandwidth that are sent every periodicity interval.
bool	autoRetrans↔ EnabledValid	Set to true if autoRetransEnabled field is specified. If false, the system will use the default setting.
bool	autoRetrans↔ Enabled	Used to enable automatic-retransmissions.
bool	peakTxPower↔ Valid	Set to true if peakTxPower is used. If false, the system will use the default setting.
int32_t	peakTxPower	Max Tx power setting in dBm.
bool	mcsIndexValid	Set to true if mcsIndex is used. If false, the system will use its default setting.
uint8_t	mcsIndex	Modulation and Coding Scheme Index to use.
bool	txPoolIdValid	Set to true if txPoolId is used. If false, the system will use its default setting.
uint8_t	txPoolId	Transmission Pool ID.

### 5.26.1.16 struct telux::cv2x::Cv2xRadioCapabilities

Contains capabilities of the Cv2xRadio.

Used in requestCapabilities and onCapabilitiesChanged

**Data fields**

Type	Field	Description
uint32_t	linkIpMtuBytes	Maximum data payload length (in bytes) of a packet supported by the IP Radio interface.
uint32_t	linkNonIp↔ MtuBytes	Maximum data payload length (in bytes) of a packet supported by the non-IP Radio interface.
Radio↔ Concurrency↔ Mode	max↔ Supported↔ Concurrency	Indicates whether this interface supports concurrent WWAN with V2X (PC5).
uint16_t	nonIpTx↔ Payload↔ OffsetBytes	Byte offset in a non-IP Tx packet before the actual payload begins.
uint16_t	nonIpRx↔ Payload↔ OffsetBytes	Byte offset in a non-IP Rx packet before the actual payload begins. : periodicitiesSupported, Use new periodicities instead
bitset< 8 >	periodicities↔ Supported	
vector< uint64_t >	periodicities	Specifies the periodicities supported
uint8_t	maxNum↔ Auto↔ Retransmissions	Least frequent bandwidth periodicity that is supported. Above this value, use event-driven periodic messages of a period larger than this value.
uint8_t	layer2Mac↔ AddressSize	Size of the L2 MAC address. Different Radio Access Technologies have different-sized L2 MAC addresses: 802.11 has 6 bytes, whereas 3GPP PC5 has only 3 bytes. Because a randomized MAC address comes from an HSM with good pseudo random entropy, higher layers must know how many bytes of the MAC address to generate.
bitset< 8 >	priorities↔ Supported	Bit set of different priority levels supported by this Cv2xRadio. Refer to Priority
uint16_t	maxNumSps↔ Flows	Maximum number of supported SPS reservations.
uint16_t	maxNumNon↔ SpsFlows	Maximum number of supported event flows (non-SPS ports).
int32_t	maxTxPower	Maximum supported transmission power.
int32_t	minTxPower	Minimum supported transmission power.
vector< Tx↔ PoolIdInfo >	txPoolIds↔ Supported	Vector of supported transmission pool IDs.
uint8_t	isUnicast↔ Supported	Non zero value if UDP event unicast is supported.

**5.26.1.17 struct telux::cv2x::MacDetails**

Contains MAC information that is reported from the actual MAC SPS in the radio. The offsets can periodically change on any given transmission report.

**Data fields**

Type	Field	Description
uint32_t	periodicityIn↔ UseNs	Actual transmission interval period (in nanoseconds) scheduled relative to 1PP 0:00.00 time
uint16_t	currently↔ Reserved↔ PeriodicBytes	Actual number of bytes currently reserved at the MAC layer. This number can be slightly larger than original request.
uint32_t	txReservation↔ OffsetNs	Actual offset, from a 1PPS pulse and TX flow periodicity, that the MAC selected and is using for the transmit reservation. If the data goes to the radio with enough time, it can be transmitted on the medium in the next immediately scheduled slot.

**5.26.1.18 struct telux::cv2x::SpsSchedulingInfo**

Contains SPS packet scheduling information that is reported from the radio.

Used in onSpsSchedulingChanged

**Data fields**

Type	Field	Description
uint8_t	spsId	SPS ID
uint64_t	utcTime	Absolute UTC start time of next selected grant in nanoseconds.
uint32_t	periodicity	Periodicity of the grant in milliseconds.

**5.26.1.19 struct telux::cv2x::TrustedUEInfo**

Contains time confidence, position confidence, and propagation delay for a trusted UE.

Used in [TrustedUEInfo](#)

**Data fields**

Type	Field	Description
uint32_t	sourceL2Id	Trusted Source L2 ID
float	time↔ Uncertainty	Time uncertainty value in milliseconds.
uint16_t	time↔ Confidence↔ Level	<b>Deprecated</b> Use timeUncertainty Time confidence level. Range from 0 to 127 with 0 being invalid/unavailable and 127 being the most confident.
uint16_t	position↔ Confidence↔ Level	Position confidence level. Range from 0 to 127 with 0 being invalid/unavailable and 127 being the most confident.
uint32_t	propagation↔ Delay	Propagation delay in microseconds.

### 5.26.1.20 struct telux::cv2x::TrustedUEInfoList

Contains list of malicious UE source L2 IDs. Contains list of trusted UE source L2 IDs and associated confidence values.

Used in updateTrustedUEList

#### Data fields

Type	Field	Description
bool	maliciousIds↔ Valid	Malicious remote UE sources are valid.
vector< uint32_t >	maliciousIds	Malicious remote UE source L2 IDs.
bool	trustedUEs↔ Valid	Trusted remote UE sources are valid.
vector< <a href="#">TrustedUE↔ Info</a> >	trustedUEs	Trusted remote UE sources.

### 5.26.1.21 struct telux::cv2x::IPv6Address

Contains IPv6 address.

Used in [DataSessionSettings](#)

#### Data fields

Type	Field	Description
uint8_t	addr[16]	

### 5.26.1.22 struct telux::cv2x::DataSessionSettings

Contains packet data session settings.

Used in requestDataSessionSettings

#### Data fields

Type	Field	Description
bool	mtuValid	Set to true if mtu is valid.
uint32_t	mtu	MTU size.
bool	ipv6AddrValid	Set to true if ipv6 address is valid.
<a href="#">IPv6Address</a>	ipv6Addr	IPv6 address.

### 5.26.1.23 struct telux::cv2x::ConfigEventInfo

Information about any update to a CV2X config file.

Used in onConfigFileChanged

**Data fields**

Type	Field	Description
<a href="#">ConfigSourceType</a>	source	The type of the V2X config file.
<a href="#">ConfigEvent</a>	event	V2X config event.

**5.26.1.24 struct telux::cv2x::L2FilterInfo**

Contains remote UE source L2 ID that modem will drop on Rx.

Used in [setL2Filters](#)

**Data fields**

Type	Field	Description
uint32_t	srcL2Id	< remote UE L2 MAC addr to filter. Duration, in millisecond (resolution 100 msec). 0 means delete the filter.
uint32_t	durationMs	/* Proximity service per packet priority (PPPP), packets with priority above this value will be dropped. Range 0-7, 0 mean all priority pkts from that UE would be dropped.
uint8_t	pppp	

**5.26.1.25 struct telux::cv2x::RFTxInfo**

Tx status per Tx chain and Tx power per Tx antenna for a specific transport block.

Used in [TxStatusReport](#)

**Data fields**

Type	Field	Description
<a href="#">RFTxStatus</a>	status	Fault detection status for a specific Tx chain.
int32_t	power	The target Tx power after MPR/AMPR reduction for a specific Tx antenna in dBm*10 format. Invalid value is -700, it means the corresponding antenna is not being used for the transmission of this transport block.

**5.26.1.26 struct telux::cv2x::TxStatusReport**

Information on Tx status of a V2X transport block that is reported from low layer.

1. A V2X packet might trigger multiple reports because of the segmentation and re-Tx in low layer.
2. If a transport block is dropped in low layer, no report will be triggered for that transport block.
3. The power in the array of rfInfo is the target Tx power value in dBm\*10 after MPR/AMPR reduction for a specific Tx antenna. The status in the array of rfInfo is the fault detection status for a specific Tx chain.
  - In CDD mode, two antennas are being used for a specific transport block, both rfInfo[0].power and rfInfo[1].power are valid (not -700), rfInfo[i].status is reflecting the status of Tx chain/Tx

antenna i.

- In TXD mode, data transmission switches between two antennas/chains and only one antenna/chain is being used for a specific transport block, the Tx antenna being used has valid power (not -700) in the array of rfInfo, rfInfo[i].status is reflecting the status of Tx chain i or the status of the Tx antenna i whose power is valid (not -700) in the array of rfInfo. Used in onTxStatusReport

#### Data fields

Type	Field	Description
<a href="#">RFTxInfo</a>	rfInfo[ <a href="#">MAX_↔</a> <a href="#">ANTENNAS_↔</a> <a href="#">_SUPPORT_↔</a> <a href="#">ED</a> ]	Tx status per Tx chain and Tx power per Tx antenna.
uint8_t	numRb	Number of resource blocks used for the transport block.
uint8_t	startRb	Start resource block index used for the transport block.
uint8_t	mcs	Modulation and coding scheme used for the transport block that is defined in 3GPP TS 36.213.
uint8_t	segNum	Total number of segments of a V2X packet.
<a href="#">SegmentType</a>	segType	Segment type of the transport block.
<a href="#">TxType</a>	txType	Indication of new Tx or re-Tx of the transport block.
uint16_t	otaTiming	OTA timing in format of system frame number*10 + subframe number.
uint16_t	port	Port number that can be used to link the report to a specific Tx flow which has the same source port number.

#### 5.26.1.27 struct telux::cv2x::IPv6AddrType

Encapsulates ipv6 prefix length in bits and ipv6 prefix.

Used in setGlobalIPInfo.

#### Data fields

Type	Field	Description
uint8_t	prefixLen	< ipv6 address prefix length in bits, range [64, 128]
uint8_t	ipv6Addr[ <a href="#">C_↔</a> <a href="#">V2X_IPV6_↔</a> <a href="#">ADDR_ARR_↔</a> <a href="#">AY_LEN</a> ]	

#### 5.26.1.28 struct telux::cv2x::GlobalIPUnicastRoutingInfo

Encapsulates destination L2 address.

Used in setGlobalIPUnicastRoutingInfo.

**Data fields**

Type	Field	Description
uint8_t	destMac↔ Addr[CV2X_↔ MAC_ADD↔ R_LEN]	< Array that stores CV2X L2 MAC address at the last 3 bytes in big endian order.

**5.26.1.29 struct telux::cv2x::RxPacketMetaDataReport**

Contains the detailed meta data report of a packet received.

The meta data report comes from the same data interface as the packet itself, it consist of RF RSSI (received signal strength indicator) status, 32-bit SCI Format 1 (3GPP TS 36.213, section 14.1), packet delay estimation, L2 destination ID, and the resource blocks used for the packet's transmission: subframe, subchannel index.

The meta data is always received after the successful receipt of the corresponding packet. In order to associate the meta data report with the specific packet, the sfn and subChannelIndex should be present in the packet's payload and the meta data report, so the meta data report can be matched up to the packet.

There is no guarantee that all items listed above will be presented, [metaDataMask](#) need to be used for the validity. Use [telux::cv2x::Cv2xRxMetaDataHelper::getRxMetaDataInfo](#) to extract the meta data.

**Data fields**

Type	Field	Description
<a href="#">RxMetaData↔ Validity</a>	metaDataMask	
uint16_t	sfn	
uint8_t	subChannel↔ Index	
uint8_t	subChannel↔ Num	
int8_t	prxRssi	
int8_t	drxRssi	
uint32_t	l2DestinationId	
uint32_t	sciFormat1Info	
int32_t	delay↔ Estimation	

**5.26.1.30 class telux::cv2x::Cv2xRxMetaDataHelper****Static Public Member Functions**

- static [telux::common::Status](#) [getRxMetaDataInfo](#) (const uint8\_t \*payload, uint32\_t payloadLength, size\_t &metaDataLen, std::shared\_ptr< std::vector< [RxPacketMetaDataReport](#) >> metaDatas)

### 5.26.1.30.1 Member Function Documentation

5.26.1.30.1.1 `static telux::common::Status telux::cv2x::Cv2xRxMetaDataHelper::getRxMetaDataInfo ( const uint8_t * payload, uint32_t payloadLength, size_t & metaDataLen, std::shared_ptr< std::vector< RxPacketMetaDataReport >> metaDatas ) [static]`

### 5.26.1.31 class telux::cv2x::ICv2xRxSubscription

This class encapsulates a Cv2xRadio Rx Subscription. It contains the Rx socket associated with the subscription from which client applications can read data. This class is referenced in Cv2xRadio::createRxSubscription and Cv2xRadio::closeRxSubscription.

#### Public member functions

- virtual uint32\_t `getSubscriptionId` () const =0
- virtual `TrafficIpType` `getIpType` () const =0
- virtual int `getSock` () const =0

#### 5.26.1.31.2 Member Function Documentation

5.26.1.31.2.1 `virtual uint32_t telux::cv2x::ICv2xRxSubscription::getSubscriptionId ( ) const [pure virtual]`

Accessor for Rx subscription ID

#### Returns

subscription ID

5.26.1.31.2.2 `virtual TrafficIpType telux::cv2x::ICv2xRxSubscription::getIpType ( ) const [pure virtual]`

Accessor for IP traffic type

#### Returns

The Rx subscriptions's IP traffic type (IP or NON-IP)

**5.26.1.31.2.3** `virtual int telux::cv2x::ICv2xRxSubscription::getSock ( ) const [pure virtual]`

Accessor for the socket file descriptor

**Returns**

The Rx subscriptions's socket fd.

**5.26.1.31.2.4** `virtual struct sockaddr_in6 telux::cv2x::ICv2xRxSubscription::getSockAddr ( ) const [pure virtual]`

Accessor for the socket address description

**Returns**

The Rx subscriptions's socket address

**5.26.1.31.2.5** `virtual uint16_t telux::cv2x::ICv2xRxSubscription::getPortNum ( ) const [pure virtual]`

Accessor for the subscriptions's port number

**Returns**

The Rx subscriptions's port num

**5.26.1.31.2.6** `virtual std::shared_ptr<std::vector<uint32_t> > telux::cv2x::ICv2xRxSubscription::getServiceIDList ( ) const [pure virtual]`

Get subscriptions's service ID list

**Returns**

The Rx subscriptions's service ID list

**5.26.1.31.2.7** `virtual void telux::cv2x::ICv2xRxSubscription::setServiceIDList ( const std::shared_ptr<std::vector< uint32_t >> idList ) [pure virtual]`

Set subscriptions's service ID list

**Parameters**

in	<i>idList</i>	- the subscriptions's service ID list
----	---------------	---------------------------------------

**5.26.1.32** `class telux::cv2x::ICv2xThrottleManagerListener`

Listener class for getting filter rate update notification.

**Public member functions**

- virtual void [onFilterRateAdjustment](#) (int rate)
- virtual void [onServiceStatusChange](#) (telux::common::ServiceStatus status)
- virtual [~ICv2xThrottleManagerListener](#) ()

**5.26.1.32.1.1** virtual telux::cv2x::ICv2xThrottleManagerListener::~~ICv2xThrottleManagerListener ( )  
[virtual]

Destructor of [ICv2xThrottleManagerListener](#)

**5.26.1.32.2 Member Function Documentation**

**5.26.1.32.2.1** virtual void telux::cv2x::ICv2xThrottleManagerListener::onFilterRateAdjustment ( int *rate* ) [virtual]

This API is invoked to advise the client to adjust the incoming message filtering rate by *rate* messages/second. If the *rate* is positive, it indicates the client to filter *rate* more messages/second. If the *rate* is negative, it indicates the client to filter *rate* less messages/second.

**Parameters**

in	<i>rate</i>	the reported filter rate adjustment value.
----	-------------	--

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.26.1.32.2.2** virtual void telux::cv2x::ICv2xThrottleManagerListener::onServiceStatusChange ( telux::common::ServiceStatus *status* ) [virtual]

This API is invoked when the service status changes for example when a subsystem restart (SSR) occurs

**Parameters**

in	<i>status</i>	- ServiceStatus
----	---------------	-----------------

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.26.1.33 class telux::cv2x::ICv2xThrottleManager

ThrottleManager provides throttle manager client interface.

ThrottleManager provides APIs that allows applications to specify the incoming verification load on the system. This is used to make decisions on how to optimally use the resources available in the system. The API also provides feedback to clients on the suggested filtering that needs to be done when the incoming message verification rate exceeds the instantaneous system capacity.

#### Public member functions

- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< ICv2xThrottleManagerListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< ICv2xThrottleManagerListener > listener)=0`
- virtual `telux::common::Status setVerificationLoad (int load, setVerificationLoadCallback cb)=0`
- virtual `~ICv2xThrottleManager ()`

#### 5.26.1.33.1 Constructors and Destructors

5.26.1.33.1.1 virtual `telux::cv2x::ICv2xThrottleManager::~~ICv2xThrottleManager ( ) [virtual]`

#### 5.26.1.33.2 Member Function Documentation

5.26.1.33.2.1 virtual `telux::common::ServiceStatus telux::cv2x::ICv2xThrottleManager::getService↔ Status ( ) [pure virtual]`

This status indicates whether the object is in a usable state.

#### Returns

SERVICE\_AVAILABLE - If location manager is ready for service. SERVICE\_UNAVAILABLE - If location manager is temporarily unavailable. SERVICE\_FAILED - If location manager encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

5.26.1.33.2.2 virtual `telux::common::Status telux::cv2x::ICv2xThrottleManager::registerListener ( std::weak_ptr< ICv2xThrottleManagerListener > listener ) [pure virtual]`

Registers a listener to receive the updated filer rate adjustment data.

in	<i>listener</i>	- Listener that implement <a href="#">ICv2xThrottleManagerListener</a> interface.
----	-----------------	---

**5.26.1.33.2.3** virtual telux::common::Status telux::cv2x::ICv2xThrottleManager::deregisterListener ( std::weak\_ptr< ICv2xThrottleManagerListener > *listener* ) [pure virtual]

Deregister a [ICv2xThrottleManagerListener](#).

#### Parameters

in	<i>listener</i>	- Previously registered Cv2xThrottleManagerListener that is deregistered.
----	-----------------	---

**5.26.1.33.2.4** virtual telux::common::Status telux::cv2x::ICv2xThrottleManager::setVerificationLoad ( int *load*, setVerificationLoadCallback *cb* ) [pure virtual]

Set current measured/average verification load.

#### Parameters

in	<i>load</i>	- current measured verification load(verification/second).
----	-------------	--

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.26.1.34 class telux::cv2x::ICv2xTxFlow

This class encapsulates a Cv2xRadio Tx flows. It contains the Tx socket associated with the flow through which client applications can send data. This class is referenced in Cv2xRadio::createTxSpsFlow, Cv2xRadio::createTxEventFlow, and Cv2xRadio::closeTxFlow

#### Public member functions

- virtual uint32\_t [getFlowId](#) () const =0
- virtual [TrafficIpType](#) [getIpType](#) () const =0
- virtual uint32\_t [getServiceId](#) () const =0
- virtual int [getSock](#) () const =0

### 5.26.1.34.1 Constructors and Destructors

5.26.1.34.1.1 `virtual telux::cv2x::ICv2xTxFlow::~~ICv2xTxFlow ( ) [virtual]`

### 5.26.1.34.2 Member Function Documentation

5.26.1.34.2.1 `virtual uint32_t telux::cv2x::ICv2xTxFlow::getFlowId ( ) const [pure virtual]`

Accessor for flow ID. The flow ID should be unique within a process but will not be unique between processes.

#### Returns

flow ID

5.26.1.34.2.2 `virtual TrafficIpType telux::cv2x::ICv2xTxFlow::getIpType ( ) const [pure virtual]`

Accessor for IP traffic type

#### Returns

The flow's IP traffic type (IP or NON-IP)

5.26.1.34.2.3 `virtual uint32_t telux::cv2x::ICv2xTxFlow::getServiceId ( ) const [pure virtual]`

Accessor for service ID

#### Returns

The flow's Service ID.

5.26.1.34.2.4 `virtual int telux::cv2x::ICv2xTxFlow::getSock ( ) const [pure virtual]`

Accessor for the socket file descriptor

#### Returns

The flow's socket fd.

5.26.1.34.2.5 `virtual struct sockaddr_in6 telux::cv2x::ICv2xTxFlow::getSockAddr ( ) const [pure virtual]`

Accessor for the socket address description

#### Returns

The flow's socket address

#### 5.26.1.34.2.6 virtual uint16\_t telux::cv2x::ICv2xTxFlow::getPortNum ( ) const [pure virtual]

Accessor for the flow's source port number

#### Returns

The flow's source port num

### 5.26.1.35 class telux::cv2x::ICv2xTxRxSocket

This class encapsulates a Cv2xRadio socket for both Tx and Rx. It contains the socket through which client applications can send and receive data. This class is referenced in Cv2xRadio::createCv2xTcpSocket and Cv2xRadio::closeCv2xTcpSocket.

#### Public member functions

- virtual uint32\_t [getId](#) ( ) const =0

#### 5.26.1.35.1 Constructors and Destructors

##### 5.26.1.35.1.1 virtual telux::cv2x::ICv2xTxRxSocket::~~ICv2xTxRxSocket ( ) [virtual]

#### 5.26.1.35.2 Member Function Documentation

##### 5.26.1.35.2.1 virtual uint32\_t telux::cv2x::ICv2xTxRxSocket::getId ( ) const [pure virtual]

Accessor for Cv2xRadio socket ID. The socket ID should be unique within a process but will not be unique between processes.

#### Returns

Cv2xRadio socket ID

##### 5.26.1.35.2.2 virtual uint32\_t telux::cv2x::ICv2xTxRxSocket::getServiceId ( ) const [pure virtual]

Accessor for service ID

#### Returns

The Service ID bound to the socket.

**5.26.1.35.2.3 virtual int telux::cv2x::ICv2xTxRxSocket::getSocket ( ) const [pure virtual]**

Accessor for the socket file descriptor

**Returns**

The socket fd.

**5.26.1.35.2.4 virtual struct sockaddr\_in6 telux::cv2x::ICv2xTxRxSocket::getSocketAddr ( ) const [pure virtual]**

Accessor for the socket address description

**Returns**

The socket address

**5.26.1.35.2.5 virtual uint16\_t telux::cv2x::ICv2xTxRxSocket::getPortNum ( ) const [pure virtual]**

Accessor for the local port number bound to the socket

**Returns**

The local port number

**5.26.1.36 class telux::cv2x::ICv2xTxStatusReportListener**

Listeners for CV2X Tx status report must implement this interface.

**Public member functions**

- virtual void [onTxStatusReport](#) (const [TxStatusReport](#) &info)
- virtual [~ICv2xTxStatusReportListener](#) ()

**5.26.1.36.1 Constructors and Destructors****5.26.1.36.1.1 virtual telux::cv2x::ICv2xTxStatusReportListener::~~ICv2xTxStatusReportListener ( ) [virtual]**

Destructor for [ICv2xTxStatusReportListener](#)

**5.26.1.36.2 Member Function Documentation**

### 5.26.1.36.2.1 virtual void telux::cv2x::ICv2xTxStatusReportListener::onTxStatusReport ( const TxStatusReport & info ) [virtual]

Called when a CV2X transport block is transmitted in low layer if CV2X Tx status report has been enabled by calling setTxStatusReport.

#### Parameters

in	<i>info</i>	- Tx status of the transport block.
----	-------------	-------------------------------------

### 5.26.1.37 class telux::cv2x::Cv2xUtil

Cv2x utility class

#### Static Public Member Functions

- static uint8\_t [priorityToTrafficClass](#) (Priority priority)
- static [Priority TrafficClassToPriority](#) (uint8\_t trafficClass)

#### 5.26.1.37.1 Member Function Documentation

##### 5.26.1.37.1.1 static uint8\_t telux::cv2x::Cv2xUtil::priorityToTrafficClass ( Priority priority ) [static]

This function is called to convert [cv2x](#) flow priority to traffic class. The Traffic Class indicates class or priority of IPv6 packet. If congestion occurs then packets with least priority will be discarded(See RFC2460 section-7). The result of this method is to fill the IPv6 header traffic class field, it is usually called just before sending IPv6 packet.

#### Parameters

in	<i>priority</i>	- <a href="#">cv2x</a> flow priority
----	-----------------	--------------------------------------

#### Returns

uint8\_t to indicate the result of traffic class

##### 5.26.1.37.1.2 static Priority telux::cv2x::Cv2xUtil::TrafficClassToPriority ( uint8\_t trafficClass ) [static]

This function is called to convert IPv6 packet traffic class to [cv2x](#) flow priority. The Traffic Class indicates class or priority of IPv6 packet. If congestion occurs then packets with least priority will be discarded(See RFC2460 section-7). It is to get the corresponding [cv2x](#) flow priority of the received packets, which usually being called when a new IPv6 packet received.

#### Parameters

in	<i>trafficClass</i>	- class or priority of IPv6 packet(See RFC2460 section-7)
----	---------------------	---

**Returns**

[cv2x](#) flow priority

**5.26.2 Enumeration Type Documentation****5.26.2.1 enum telux::cv2x::TrafficCategory [strong]**

Defines CV2X Traffic Types.

Used in `Cv2xRadioManager::getCv2xRadio`

**Enumerator**

***SAFETY\_TYPE*** Safety message traffic category

***NON\_SAFETY\_TYPE*** Non-safety message traffic category

**5.26.2.2 enum telux::cv2x::Cv2xStatusType [strong]**

Defines possible values for CV2X radio RX/TX status.

1. If Rx is in inactive state, Tx should also be in inactive state.
2. If Rx is in active state, Tx should be in active(normal case) or suspended state(sensing or tunnel mode).
3. If Rx is in suspended state, Tx should be in suspended state. Used in [Cv2xStatus](#)

**Enumerator**

***INACTIVE*** RX/TX is inactive

***ACTIVE*** RX/TX is active

***SUSPENDED*** RX/TX is suspended

***UNKNOWN*** RX/TX status unknown

**5.26.2.3 enum telux::cv2x::Cv2xCauseType [strong]**

Defines possible values for cause of CV2X radio failure. The cause code is only associated with [cv2x](#) suspend/inactive status, if [cv2x](#) is active, the cause code has no meaning. Used in [Cv2xStatus](#)

**Enumerator**

***TIMING*** CV2X is suspended due to the outage of timing reference.

***CONFIG*** CV2X is inactive due to v2x.xml is missing, invalid, or expired.

***UE\_MODE*** CV2X is inactive due to CV2X mode is not started.

***GEOPOLYGON*** CV2X is inactive due to UE enters a geo-polygon that does not support [cv2x](#).

***THERMAL*** CV2X is suspended when the device's temperature is high.

***THERMAL\_ECALL*** CV2X is suspended when the device's temperature is high and emergency call is ongoing.

***GEOPOLYGON\_SWITCH*** CV2X is suspended when UE switches to a new geopolygon that also supports CV2X and UE is already in CV2X active status, CV2X status will change to active after the update is done.

***SENSING*** CV2X Tx is suspended when GNSS signal recovers or CV2X mode just starts. UE needs

sensing for 1 second before Tx can begin, Tx status will change to active after sensing is done.

**LPM** CV2X is inactive when UE enters Low Power Mode.

**DISABLED** CV2X is inactive due to CV2X is disabled in the EFS.

**NO\_GNSS** CV2X is inactive due to GNSS signal is not available when starting CV2X.

**INVALID\_LICENSE** CV2X is inactive due to invalid license.

**UNKNOWN** Invalid cause type only used internally.

#### 5.26.2.4 enum telux::cv2x::SlssSyncPattern [strong]

Defines possible values for SLSS sync pattern. Used in [SyncRefUeInfo](#)

##### Enumerator

**OFFSET\_IND\_1** UE transmits SLSS in subframes indicated by the syncOffsetIndicator1 specified in V2X configuration.

**OFFSET\_IND\_2** UE transmits SLSS in subframes indicated by the syncOffsetIndicator2 specified in V2X configuration.

**OFFSET\_IND\_3** UE transmits SLSS in subframes indicated by the syncOffsetIndicator3 specified in V2X configuration.

**ODD\_RESERVED** UE transmits SLSS in odd-numbered reserved subframes.

**EVEN\_RESERVED** UE transmits SLSS in even-numbered reserved subframes.

**UNKNOWN** Invalid cause type only used internally.

#### 5.26.2.5 enum telux::cv2x::TrafficIpType [strong]

Defines CV2X traffic type in terms of IP or NON-IP.

Used in createRxSock, createTxSpsSock, and createTxEventSock

##### Enumerator

**TRAFFIC\_IP** IP message traffic

**TRAFFIC\_NON\_IP** NON-IP message traffic

#### 5.26.2.6 enum telux::cv2x::RadioConcurrencyMode [strong]

Defines CV2X modes of concurrency with cellular WWAN.

Used in [Cv2xRadioCapabilities](#)

##### Enumerator

**WWAN\_NONCONCURRENT** No simultaneous WWAN + CV2X on this interface

**WWAN\_CONCURRENT** Interface supports requests for concurrent WWAN + CV2X connections.

#### 5.26.2.7 enum telux::cv2x::Cv2xEvent [strong]

Defines CV2X status change events. The state can change in response to the loss of timing precision or a geofencing change.

Used in onStatusChanged in [ICv2xRadioListener](#)

**Enumerator**

***CV2X\_INACTIVE***  
***CV2X\_ACTIVE***  
***TX\_SUSPENDED***  
***TXRX\_SUSPENDED***

**5.26.2.8 enum telux::cv2x::Priority [strong]**

Range of supported priority levels, where a lower number means a higher priority. For example, 8 is the current 3GPP standard.

Used in [Cv2xRadioCapabilities](#) and [SpsFlowInfo](#)

**Enumerator**

***MOST\_URGENT***  
***PRIORITY\_1***  
***PRIORITY\_2***  
***PRIORITY\_3***  
***PRIORITY\_4***  
***PRIORITY\_5***  
***PRIORITY\_6***  
***PRIORITY\_BACKGROUND***  
***PRIORITY\_UNKNOWN***

**5.26.2.9 enum telux::cv2x::Periodicity [strong]**

Range of supported periodicities in milliseconds.

Used in [Cv2xRadioCapabilities](#) and [SpsFlowInfo](#)

: enum class not going to be supported in future releases. Clients should stop using this. Once a class has been marked as Deprecated, the class could be removed in future releases.

**Enumerator**

***PERIODICITY\_10MS***  
***PERIODICITY\_20MS***  
***PERIODICITY\_50MS***  
***PERIODICITY\_100MS***  
***PERIODICITY\_UNKNOWN***

**5.26.2.10 enum telux::cv2x::ConfigSourceType [strong]**

V2X configuration source types listed in ascending order of priority. The system always uses the V2X configuration with the highest priority if multiple V2X configuration sources exist.

Used in [ConfigEventInfo](#)

**Enumerator**

***UNKNOWN*** V2X config file source is unknown  
***PRECONFIG*** V2X config file source is preconfig

**SIM\_CARD** V2X config file source is SIM card

**OMA\_DM** V2X config file source is OMA-DM

#### 5.26.2.11 enum telux::cv2x::ConfigEvent [strong]

Defines possible values for the events relevant to CV2X config file.

Used in [ConfigEventInfo](#)

##### Enumerator

**CHANGED** V2X config file is changed

**EXPIRED** V2X config file is expired

#### 5.26.2.12 enum telux::cv2x::RFTxStatus [strong]

Fault detection for Tx chain that including PA and front end.

Used in [RFTxInfo](#)

##### Enumerator

**INACTIVE** The Tx chain is not working.

**OPERATIONAL** The Tx chain is operational.

**FAULT** Fault detected on the Tx chain.

#### 5.26.2.13 enum telux::cv2x::SegmentType [strong]

Defines possible values for the segment type of a transport block.

Used in [TxStatusReport](#)

##### Enumerator

**FIRST** V2X packet is segmented, it's the first transport block.

**LAST** V2X packet is segmented, it's the last transport block.

**MIDDLE** V2X packet is segmented, it's a transport block between first and last.

**ONLY\_ONE** V2X packet is not segmented, it's the only one transport block.

#### 5.26.2.14 enum telux::cv2x::TxType [strong]

Defines new Tx or re-Tx type relevant to a transport block.

Used in [TxStatusReport](#)

##### Enumerator

**NEW\_TX** New Tx of the V2X transport block.

**RE\_TX** Re-Tx of the V2X transport block.

**SLSS\_TX** Tx of SLSS.

### 5.26.2.15 enum telux::cv2x::RxMetaDataValidityType

Specify set of RX Meta data that contribute to received packet's meta data report. Used in [RxPacketMetaDataReport](#)

#### Enumerator

- RX\_SUBFRAME\_NUMBER*** Bit mask to specify whether sfn is valid in [RxPacketMetaDataReport](#) Bit mask to specify whether subChannelIndex is valid in [RxPacketMetaDataReport](#)
- RX\_SUBCHANNEL\_INDEX*** Bit mask to specify whether subChannelNum is valid in [RxPacketMetaDataReport](#)
- RX\_SUBCHANNEL\_NUMBER*** Bit mask to specify whether rssi0 is valid in [RxPacketMetaDataReport](#)
- RX\_PRX\_RSSI*** Bit mask to specify whether rssi1 is valid in [RxPacketMetaDataReport](#)
- RX\_DRX\_RSSI*** Bit mask to specify whether l2DestinationId is valid in [RxPacketMetaDataReport](#)
- RX\_L2\_DEST\_ID*** Bit mask to specify whether sciFormat1Info is valid in [RxPacketMetaDataReport](#)
- RX\_SCI\_FORMAT1*** Bit mask to specify whether delayEstimation is valid in [RxPacketMetaDataReport](#)
- RX\_DELAY\_ESTIMATION***

## 5.26.3 Variable Documentation

### 5.26.3.1 constexpr uint8\_t telux::cv2x::MAX\_ANTENNAS\_SUPPORTED = 2u

Defines Maximum number of antennas that is supported.

Used in [TxStatusReport](#)

## 5.27 audio

- [Audio Stream](#)

This section contains APIs related to audio.

## 5.28 Audio Stream

This section contains APIs related to Audio Stream operation.

### 5.28.1 Data Structure Documentation

#### 5.28.1.1 struct telux::audio::FormatParams

Frame format common parameters

#### 5.28.1.2 struct telux::audio::AmrwbpParams

Frame format codec specific parameters

##### Data Fields

- [uint32\\_t bitWidth](#)
- [AmrwbpFrameFormat frameFormat](#)

##### 5.28.1.2.1 Field Documentation

###### 5.28.1.2.1.1 uint32\_t telux::audio::AmrwbpParams::bitWidth

Bitwidth of Stream, Typical Values <16/24>.

###### 5.28.1.2.1.2 AmrwbpFrameFormat telux::audio::AmrwbpParams::frameFormat

#### 5.28.1.3 struct telux::audio::StreamConfig

Common Stream configuration parameters

##### Data fields

Type	Field	Description
<a href="#">StreamType</a>	type	
int	modemSubId	<b>Deprecated</b> Represents modem Subscription ID, Default set to 1. Applicable only for Voice Call
SlotId	slotId	Represents slotId, applicable for voice call only
uint32_t	sampleRate	Sample Rate of Stream, Typical Values <8k/16k/32k/48k>
<a href="#">ChannelType↔ Mask</a>	<a href="#">channelType↔ Mask</a>	
<a href="#">AudioFormat</a>	format	
vector< <a href="#">DeviceType</a> >	deviceTypes	

Type	Field	Description
vector< <a href="#">Direction</a> >	voicePaths	Represent voice path direction for in call audio. TX for Uplink and RX for Downlink.>
<a href="#">FormatParams</a> *	formatParams	
<a href="#">EcnrMode</a>	ecnrMode	Represents ECNR mode for stream. It is applicable only to <a href="#">StreamType::VOICE_CALL</a>

#### 5.28.1.4 struct telux::audio::FormatInfo

Represents information about the audio format.

##### Data fields

Type	Field	Description
uint32_t	sampleRate	Sample Rate of audio, Typical Values <8k/16k/32k/48k>
<a href="#">ChannelType</a> ↔ <a href="#">Mask</a>	mask	parameter for configuration of channel type
<a href="#">AudioFormat</a>	format	Represents audio format
<a href="#">FormatParams</a> *	params	Represents codec specific parameters, like Frame Format

#### 5.28.1.5 struct telux::audio::ChannelVolume

Stream Channel Volume parameters

##### Data fields

Type	Field	Description
<a href="#">ChannelType</a>	channelType	
float	vol	Volume range in float <0 to 1.0>. 0 represents min volume, 1 represents max volume

#### 5.28.1.6 struct telux::audio::StreamVolume

Stream Channel Volume parameters consolidating entire Stream

##### Data fields

Type	Field	Description
vector< <a href="#">ChannelVolume</a> >	volume	
<a href="#">Stream</a> ↔ <a href="#">Direction</a>	dir	

### 5.28.1.7 struct telux::audio::StreamMute

Stream Mute parameters

#### Data fields

Type	Field	Description
bool	enable	enable or disable mute on stream
<a href="#">Stream↔ Direction</a>	dir	

### 5.28.1.8 struct telux::audio::StreamBuffer

Stream Data Buffer

#### Data fields

Type	Field	Description
vector< uint8↔ _t >	buffer	Buffer with Size encapsulated
size_t	offset	Actual Buffer Content starting position
int64_t	timestamp	For future use

### 5.28.1.9 struct telux::audio::DtmfTone

DTMF tone parameters

#### Data fields

Type	Field	Description
<a href="#">DtmfLowFreq</a>	lowFreq	Lower frequency associated with DTMF tone
<a href="#">DtmfHighFreq</a>	highFreq	Higher frequency associated with DTMF tone
<a href="#">Stream↔ Direction</a>	direction	Direction associated with DTMF tone

### 5.28.1.10 class telux::audio::AudioFactory

[AudioFactory](#) allows creation of audio manager.

#### Public member functions

- std::shared\_ptr< [IAudioManager](#) > [getAudioManager](#) (telux::common::InitResponseCb callback=nullptr)

#### Static Public Member Functions

- static [AudioFactory](#) & [getInstance](#) ()

### 5.28.1.10.1 Member Function Documentation

#### 5.28.1.10.1.1 static AudioFactory& telux::audio::AudioFactory::getInstance ( ) [static]

Get Audio Factory instance.

#### 5.28.1.10.1.2 std::shared\_ptr<IAudioManager> telux::audio::AudioFactory::getAudioManager ( telux::common::InitResponseCb *callback* = *nullptr* )

Get instance of audio manager.

#### Parameters

in	<i>callback</i>	Optional callback to get the response of AudioManager initialization.
----	-----------------	---

#### Returns

[IAudioManager](#) pointer.

### 5.28.1.11 class telux::audio::IVoiceListener

Listener class for getting notifications related to DTMF tone detection. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe.

#### Public member functions

- virtual void [onDtmfToneDetection](#) ([DtmfTone](#) dtmfTone)
- virtual [~IVoiceListener](#) ()

#### 5.28.1.11.1 Constructors and Destructors

##### 5.28.1.11.1.1 virtual telux::audio::IVoiceListener::~~IVoiceListener ( ) [virtual]

Destructor of [IVoiceListener](#)

#### 5.28.1.11.2 Member Function Documentation

##### 5.28.1.11.2.1 virtual void telux::audio::IVoiceListener::onDtmfToneDetection ( [DtmfTone](#) *dtmfTone* ) [virtual]

This function is called when a DTMF tone is detected in the voice stream

#### Parameters

in	<i>dtmfTone</i>	DTMF tone properties
----	-----------------	----------------------

## 5.28.1.12 class telux::audio::IPlayListener

### Public member functions

- virtual void [onReadyForWrite](#) ()
- virtual void [onPlayStopped](#) ()
- virtual [~IPlayListener](#) ()

### 5.28.1.12.1 Constructors and Destructors

#### 5.28.1.12.1.1 virtual telux::audio::IPlayListener::~IPlayListener ( ) [virtual]

Destructor of [IPlayListener](#)

### 5.28.1.12.2 Member Function Documentation

#### 5.28.1.12.2.1 virtual void telux::audio::IPlayListener::onReadyForWrite ( ) [virtual]

This function is called when pipeline is ready to accept new buffer. It is applicable only for compressed audio format type where a client can write and queue buffers for playback.

#### 5.28.1.12.2.2 virtual void telux::audio::IPlayListener::onPlayStopped ( ) [virtual]

This function is called when stopAudio() is called with [StopType::STOP\\_AFTER\\_PLAY](#). It indicates that all the buffers that were present in the pipeline have been played.

## 5.28.1.13 class telux::audio::ITranscodeListener

### Public member functions

- virtual void [onReadyForWrite](#) ()
- virtual [~ITranscodeListener](#) ()

### 5.28.1.13.1 Constructors and Destructors

#### 5.28.1.13.1.1 virtual telux::audio::ITranscodeListener::~ITranscodeListener ( ) [virtual]

Destructor of [ITranscodeListener](#)

### 5.28.1.13.2 Member Function Documentation

#### 5.28.1.13.2.1 virtual void telux::audio::ITranscodeListener::onReadyForWrite ( ) [virtual]

This function is called when pipeline is ready to accept new buffer. It is applicable only for compressed audio format type where a client can write and queue buffers for transcoding.

### 5.28.1.14 class telux::audio::IAudioListener

#### Public member functions

- virtual [~IAudioListener](#) ()

#### 5.28.1.14.1 Constructors and Destructors

##### 5.28.1.14.1.1 virtual telux::audio::IAudioListener::~~IAudioListener ( ) [virtual]

Destructor of [IAudioListener](#)

### 5.28.1.15 class telux::audio::IAudioBuffer

Stream Buffer manages the buffer to be used for read and write operations on Audio Streams. For write operations, applications should request a stream buffer, populate it with the data and then pass it to the write operation and set the dataSize that is to be written to the stream. Similarly for read operations, the application should request a stream buffer and use that in the read operation. At the end of the read, the stream buffer will contain the data read. Once an operation (read/write) has completed, the stream buffer could be reused for a subsequent read/write operation, provided [reset\(\)](#) API called on stream buffer between subsequent calls.

#### Public member functions

- virtual size\_t [getMinSize](#) ()=0
- virtual size\_t [getMaxSize](#) ()=0
- virtual uint8\_t \* [getRawBuffer](#) ()=0
- virtual uint32\_t [getDataSize](#) ()=0
- virtual void [setDataSize](#) (uint32\_t size)=0
- virtual [telux::common::Status reset](#) ()=0
- virtual [~IAudioBuffer](#) ()

#### 5.28.1.15.1 Constructors and Destructors

##### 5.28.1.15.1.1 virtual telux::audio::IAudioBuffer::~~IAudioBuffer ( ) [virtual]

#### 5.28.1.15.2 Member Function Documentation

##### 5.28.1.15.2.1 virtual size\_t telux::audio::IAudioBuffer::getMinSize ( ) [pure virtual]

Returns the minimum size (in bytes) of data that caller needs to read/write before calling a read/write operation on the stream.

#### Returns

minimum size

**5.28.1.15.2.2 virtual size\_t telux::audio::IAudioBuffer::getMaxSize ( ) [pure virtual]**

Returns the maximum size (in bytes) that the buffer can hold.

**Returns**

maximum size

**5.28.1.15.2.3 virtual uint8\_t\* telux::audio::IAudioBuffer::getRawBuffer ( ) [pure virtual]**

Gets the raw buffer that [IStreamBuffer](#) manages. Application should write in between(include) of [getMinSize\(\)](#) to [getMaxSize\(\)](#) number of bytes in this buffer. Application is not responsible to free the raw buffer. It will be free'd when the [IStreamBuffer](#) is destroyed.

**Returns**

raw buffer

**5.28.1.15.2.4 virtual uint32\_t telux::audio::IAudioBuffer::getDataSize ( ) [pure virtual]**

Gets the size (in bytes) of valid data present in the buffer.

**Returns**

size of valid data in the buffer

**5.28.1.15.2.5 virtual void telux::audio::IAudioBuffer::setDataSize ( uint32\_t size ) [pure virtual]**

Sets the size (in bytes) of valid data present in the buffer.

**Parameters**

<i>size</i>	size of valid data in the buffer
-------------	----------------------------------

**5.28.1.15.2.6 virtual telux::common::Status telux::audio::IAudioBuffer::reset ( ) [pure virtual]**

Reset all state and data of the buffer. This is to be called when reusing the same buffer for multiple operations.

**Returns**

status Status of the operation

**5.28.1.16 class telux::audio::IStreamBuffer**

**Public member functions**

- virtual [~IStreamBuffer](#) ()

**5.28.1.16.1 Constructors and Destructors**

**5.28.1.16.1.1** virtual [telux::audio::IStreamBuffer::~IStreamBuffer](#) ( ) [**virtual**]

**5.28.1.17 class telux::audio::IAudioManager**

Audio Manager is a primary interface for audio operations. It provide APIs to manage Streams ( like voice, play, record etc) and sound cards.

**Public member functions**

- virtual bool [isSubsystemReady](#) ()=0
- virtual [telux::common::ServiceStatus getServiceStatus](#) ()=0

- virtual [telux::common::Status deRegisterListener](#) (std::weak\_ptr< [IAudioListener](#) > listener)=0
- virtual [telux::common::Status getCalibrationInitStatus](#) ([GetCalInitStatusResponseCb](#) callback)=0
- virtual [~IAudioManager](#) ()

**5.28.1.17.1 Constructors and Destructors**

**5.28.1.17.1.1** virtual [telux::audio::IAudioManager::~IAudioManager](#) ( ) [**virtual**]

**5.28.1.17.2 Member Function Documentation**

**5.28.1.17.2.1** virtual bool [telux::audio::IAudioManager::isSubsystemReady](#) ( ) [**pure virtual**]

Checks the status of audio subsystems and returns the result.

**Returns**

If true that means AudioManager is ready for performing audio operations.

**Deprecated** Use getServiceStatus API

**5.28.1.17.2.2** `virtual telux::common::ServiceStatus telux::audio::IAudioManager::getServiceStatus ( )`  
**[pure virtual]**

This status indicates whether the object is in a usable state or not.

#### Returns

SERVICE\_AVAILABLE - if audio manager is ready to use. SERVICE\_UNAVAILABLE - if audio manager is temporarily unavailable to use. SERVICE\_FAILED - if audio manager encountered an irrecoverable failure and can not be used.

**5.28.1.17.2.3** `virtual std::future<bool> telux::audio::IAudioManager::onSubsystemReady ( )` **[pure virtual]**

Wait for Audio subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when audio subsystem is ready.

**Deprecated** Use InitResponseCb callback in factory API getAudioManager.

**5.28.1.17.2.4** `virtual telux::common::Status telux::audio::IAudioManager::getDevices ( GetDevices←  
 ResponseCb callback = nullptr )` **[pure virtual]**

Get the list of supported audio devices, which are currently supported in the audio subsystem

#### Parameters

in	<i>callback</i>	callback pointer to get the response of getDevices.
----	-----------------	---

#### Returns

Status of request i.e. success or suitable status code.

**5.28.1.17.2.5** `virtual telux::common::Status telux::audio::IAudioManager::getStreamTypes ( GetStreamTypesResponseCb callback = nullptr )` **[pure virtual]**

Get the list of supported audio streams types, which are currently supported in the audio subsystem

#### Parameters

in	<i>callback</i>	callback pointer to get the response of getStreamTypes.
----	-----------------	---

**Returns**

Status of request i.e. success or suitable status code.

**5.28.1.17.2.6 virtual telux::common::Status telux::audio::IAudioManager::createStream ( StreamConfig streamConfig, CreateStreamResponseCb callback = nullptr ) [pure virtual]**

Creates the stream for audio operation

**Parameters**

in	<i>streamConfig</i>	stream configuration.
in	<i>callback</i>	callback pointer to get the response of createStream.

**Returns**

Status of request i.e. success or suitable status code.

**5.28.1.17.2.7 virtual telux::common::Status telux::audio::IAudioManager::createTranscoder ( FormatInfo input, FormatInfo output, CreateTranscoderResponseCb callback ) [pure virtual]**

Creates an instance of transcoder that can be used for transcoding operations. The supported transcoding is real time transcoding, which takes the playback time of file for completing the operation. Each instance returned can be used for single transcoding operation. The instance can not be used for multiple transcoding operation.

**Parameters**

in	<i>input</i>	configuration of input buffers that needs to be transcoded.
in	<i>output</i>	configuration of transcoded output buffers.
in	<i>callback</i>	callback pointer to get the response of createTranscoder.

**Returns**

Status of request i.e. success or suitable status code.

**5.28.1.17.2.8 virtual telux::common::Status telux::audio::IAudioManager::deleteStream ( std::shared\_ptr< IAudioStream > stream, DeleteStreamResponseCb callback = nullptr ) [pure virtual]**

Deletes the specified stream which was created before

**Parameters**

in	<i>stream</i>	reference to stream to be deleted.
in	<i>callback</i>	callback pointer to get the response of deleteStream.

**Returns**

Status of request i.e. success or suitable status code.

**5.28.1.17.2.9** `virtual telux::common::Status telux::audio::IAudioManager::registerListener ( std::weak_ptr< IAudioListener > listener ) [pure virtual]`

Register a listener to get notified when service status changes.

**Parameters**

in	<i>listener</i>	Pointer of IServiceListener object that processes the notification
----	-----------------	--

**Returns**

Status of registerListener i.e success or suitable status code.

**5.28.1.17.2.10** `virtual telux::common::Status telux::audio::IAudioManager::deRegisterListener ( std::weak_ptr< IAudioListener > listener ) [pure virtual]`

Remove a previously registered listener.

**Parameters**

in	<i>listener</i>	Previously registered IServiceListener that needs to be removed
----	-----------------	---

**Returns**

Status of deRegisterListener, success or suitable status code

**5.28.1.17.2.11** `virtual telux::common::Status telux::audio::IAudioManager::getCalibrationInitStatus ( GetCallInitStatusResponseCb callback ) [pure virtual]`

Get calibration status. Returns whether audio subsystem was able to successfully initialize calibration in system. Calibration init status is available after the initialization of the audio subsystem or after re-intialization of audio subsystem in case of sub system restart is triggered.

**Parameters**

in	<i>callback</i>	callback pointer to get the response of getCalibrationInitStatus.
----	-----------------	---

**Returns**

Status of getCalibrationInitStatus, success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated.It is subject to change and could break backwards compatibility.

### 5.28.1.18 class telux::audio::IAudioDevice

Audio device and it's characteristics like Direction (Sink or Source), type.

#### Public member functions

- virtual [DeviceType](#) `getType` ()=0
- virtual [DeviceDirection](#) `getDirection` ()=0
- virtual [~IAudioDevice](#) ()

#### 5.28.1.18.1 Constructors and Destructors

5.28.1.18.1.1 virtual [telux::audio::IAudioDevice::~~IAudioDevice](#) ( ) [[virtual](#)]

#### 5.28.1.18.2 Member Function Documentation

5.28.1.18.2.1 virtual [DeviceType](#) [telux::audio::IAudioDevice::getType](#) ( ) [[pure virtual](#)]

Get the type of Device (i.e SPEAKER, MIC etc)

#### Returns

[DeviceType](#)

5.28.1.18.2.2 virtual [DeviceDirection](#) [telux::audio::IAudioDevice::getDirection](#) ( ) [[pure virtual](#)]

Provide direction of device whether is Sink for audio data ( RX i.e. speaker, etc) or Source for audio data ( TX i.e. mic, etc)

#### Returns

[DeviceDirection](#)

### 5.28.1.19 class telux::audio::IAudioStream

[IAudioStream](#) represents single audio stream with base properties.

#### Public member functions

- virtual [StreamType](#) `getType` ()=0
- virtual [telux::common::Status](#) `setDevice` (std::vector< [DeviceType](#) > devices, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) `getDevice` ([GetStreamDeviceResponseCb](#) callback=nullptr)=0
- virtual [telux::common::Status](#) `setVolume` ([StreamVolume](#) volume, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) `getVolume` ([StreamDirection](#) dir, [GetStreamVolumeResponseCb](#)

callback=nullptr)=0

- virtual `telux::common::Status setMute (StreamMute mute, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status getMute (StreamDirection dir, GetStreamMuteResponseCb callback=nullptr)=0`
- virtual `~IAudioStream ()`

### 5.28.1.19.1 Constructors and Destructors

5.28.1.19.1.1 virtual `telux::audio::IAudioStream::~IAudioStream ( ) [virtual]`

### 5.28.1.19.2 Member Function Documentation

5.28.1.19.2.1 virtual `StreamType telux::audio::IAudioStream::getType ( ) [pure virtual]`

Get the stream type like VOICE, PLAY, CAPTURE

#### Returns

StreamType

5.28.1.19.2.2 virtual `telux::common::Status telux::audio::IAudioStream::setDevice ( std::vector< DeviceType > devices, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Set Device of audio stream

#### Parameters

in	<i>devices</i>	Devices list.
in	<i>callback</i>	callback to get the response of setDevice.

#### Returns

Status of the request i.e. success or suitable status code.

5.28.1.19.2.3 virtual `telux::common::Status telux::audio::IAudioStream::getDevice ( GetStream↔ DeviceResponseCb callback = nullptr ) [pure virtual]`

Get Device of audio stream

#### Parameters

in	<i>callback</i>	callback to get the response of getDevice
----	-----------------	---

#### Returns

Status of the request i.e. success or suitable status code.

**5.28.1.19.2.4 virtual telux::common::Status telux::audio::IAudioStream::setVolume ( StreamVolume *volume*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

Set Volume of audio stream. Application needs to provide direction of the stream. Currently TX direction of [VOICE\\_CALL](#) is not supported.

**Parameters**

in	<i>volume</i>	volume setting per channel for direction.
in	<i>callback</i>	callback to get the response of setVolume.

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.19.2.5 virtual telux::common::Status telux::audio::IAudioStream::getVolume ( StreamDirection *dir*, GetStreamVolumeResponseCb *callback* = *nullptr* ) [pure virtual]**

Get Volume of audio stream. Application needs to provide direction of the stream. Currently TX direction of [VOICE\\_CALL](#) is not supported.

**Parameters**

in	<i>dir</i>	Stream Direction to query volume details.
in	<i>callback</i>	callback to get the response of getVolume.

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.19.2.6 virtual telux::common::Status telux::audio::IAudioStream::setMute ( StreamMute *mute*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

Set Mute of audio stream

**Parameters**

in	<i>mute</i>	mute setting for direction.
in	<i>callback</i>	callback to know the status of the request.

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.19.2.7 virtual telux::common::Status telux::audio::IAudioStream::getMute ( StreamDirection *dir*, GetStreamMuteResponseCb *callback* = *nullptr* ) [pure virtual]**

Get Mute of audio stream

in	<i>dir</i>	Stream Direction to query mute details.
in	<i>callback</i>	callback to get the response of getMute.

## Returns

Status of the request i.e. success or suitable status code.

### 5.28.1.20 class telux::audio::IAudioVoiceStream

[IAudioVoiceStream](#) represents single voice stream.

#### Public member functions

- virtual [telux::common::Status startAudio](#) ([telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status stopAudio](#) ([telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status playDtmfTone](#) ([DtmfTone](#) dtmfTone, uint16\_t duration, uint16\_t gain, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status stopDtmfTone](#) ([StreamDirection](#) direction, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status registerListener](#) (std::weak\_ptr< [IVoiceListener](#) > listener, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status deRegisterListener](#) (std::weak\_ptr< [IVoiceListener](#) > listener)=0
- virtual [~IAudioVoiceStream](#) ()

#### 5.28.1.20.1 Constructors and Destructors

5.28.1.20.1.1 virtual [telux::audio::IAudioVoiceStream::~~IAudioVoiceStream](#) ( ) [[virtual](#)]

#### 5.28.1.20.2 Member Function Documentation

5.28.1.20.2.1 virtual [telux::common::Status telux::audio::IAudioVoiceStream::startAudio](#) ([telux::common::ResponseCallback](#) *callback = nullptr*) [[pure virtual](#)]

Starts audio stream

#### Parameters

in	<i>callback</i>	callback to get the response of startAudio.
----	-----------------	---

## Returns

Status of the request i.e. success or suitable status code.

**5.28.1.20.2.2 virtual telux::common::Status telux::audio::IAudioVoiceStream::stopAudio ( telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

Stops audio stream

#### Parameters

in	<i>callback</i>	callback to get the response of stopAudio.
----	-----------------	--

#### Returns

Status of the request i.e. success or suitable status code.

**5.28.1.20.2.3 virtual telux::common::Status telux::audio::IAudioVoiceStream::playDtmfTone ( DtmfTone *dtmfTone*, uint16\_t *duration*, uint16\_t *gain*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

Plays in-band DTMF tone on the active voice stream. This API supports DTMF tone playback on local device on the RX path, for playing DTMF on the TX path so that it is heard on far end use [telux::tel::ICall::startDtmfTone](#) API.

#### Parameters

in	<i>dtmfTone</i>	DTMF tone properties [in] duration Duration (in milliseconds) for which the tone needs to be played. The constant infiniteDtmfDuration(=0xFFFF) represents infinite duration. [in] gain DTMF tone gain [in] callback callback to get the response of playDtmfTone.
----	-----------------	--

#### Returns

Status of the request i.e. success or suitable status code.

**5.28.1.20.2.4 virtual telux::common::Status telux::audio::IAudioVoiceStream::stopDtmfTone ( StreamDirection *direction*, telux::common::ResponseCallback *callback* = *nullptr* ) [pure virtual]**

Stops the DTMF tone which is being played (i.e duration not expired) on the active voice stream

#### Parameters

in	<i>direction</i>	Direction associated with the DTMF tone @ [in] callback callback to get the response of stopDtmfTone.
----	------------------	---

#### Returns

Status of the request i.e. success or suitable status code.

**5.28.1.20.2.5** `virtual telux::common::Status telux::audio::IAudioVoiceStream::registerListener ( std::weak_ptr< IVoiceListener > listener, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Register a listener to get notified when a DTMF tone is detected in the active voice stream

#### Parameters

in	<i>listener</i>	Pointer of <a href="#">IVoiceListener</a> object that processes the notification [in] callback callback to get the response of registerListener
----	-----------------	--

#### Returns

Status of registerListener i.e success or suitable status code.

**5.28.1.20.2.6** `virtual telux::common::Status telux::audio::IAudioVoiceStream::deRegisterListener ( std::weak_ptr< IVoiceListener > listener ) [pure virtual]`

Remove a previously registered listener.

#### Parameters

in	<i>listener</i>	Previously registered <a href="#">IVoiceListener</a> that needs to be removed
----	-----------------	---

#### Returns

Status of deRegisterListener, success or suitable status code

### 5.28.1.21 class telux::audio::IAudioPlayStream

[IAudioPlayStream](#) represents single audio playback stream.

#### Public member functions

- `virtual std::shared_ptr< IStreamBuffer > getStreamBuffer ()=0`
- `virtual telux::common::Status write (std::shared_ptr< IStreamBuffer > buffer, WriteResponseCb callback=nullptr)=0`
- `virtual telux::common::Status stopAudio (StopType stopType, telux::common::ResponseCallback callback=nullptr)=0`
- `virtual telux::common::Status registerListener (std::weak_ptr< IPlayListener > listener)=0`
- `virtual telux::common::Status deRegisterListener (std::weak_ptr< IPlayListener > listener)=0`
- `virtual ~IAudioPlayStream ()`

### 5.28.1.21.1 Constructors and Destructors

5.28.1.21.1.1 `virtual telux::audio::IAudioPlayStream::~IAudioPlayStream ( ) [virtual]`

### 5.28.1.21.2 Member Function Documentation

5.28.1.21.2.1 `virtual std::shared_ptr<IStreamBuffer> telux::audio::IAudioPlayStream::getStreamBuffer ( ) [pure virtual]`

Get an Audio [StreamBuffer](#) to be used for playback operations

#### Returns

an Audio Buffer or a nullptr in case of error

5.28.1.21.2.2 `virtual telux::common::Status telux::audio::IAudioPlayStream::write ( std::shared_ptr<IStreamBuffer > buffer, WriteResponseCb callback = nullptr ) [pure virtual]`

Write Samples to audio stream. First write starts playback operation.

Write in case of compressed audio format maintains a pipeline, if the callback returns with same number of bytes written as requested and no error occurred, user can send next buffer. If the number of bytes returned are not equal to the requested write size, then need to resend the buffer again from the leftover offset after waiting for the () event. Once the last buffer is sent and the playback operation is complete, delete the playback stream to avoid receiving silent packets on RX path.

#### Parameters

in	<i>buffer</i>	stream buffer for write.
in	<i>callback</i>	callback to get the response of write.

#### Returns

Status of the request i.e. success or suitable status code.

5.28.1.21.2.3 `virtual telux::common::Status telux::audio::IAudioPlayStream::stopAudio ( StopType stopType, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

This API is to be used to stop playback. It is applicable only for compressed audio format playback.

#### Parameters

in	<i>callback</i>	callback to get the response of stopAudio.
in	<i>stopType</i>	it specifies type of stop for stopping audio playback.

#### Returns

Status of the request i.e. success or suitable status code.

#### 5.28.1.21.2.4 virtual telux::common::Status telux::audio::IAudioPlayStream::registerListener ( std::weak\_ptr< IPlayListener > *listener* ) [pure virtual]

Register a listener to get notified for events of Play Stream

##### Parameters

in	<i>listener</i>	Pointer of <a href="#">IPlayListener</a> object that processes the notification [in] callback callback to get the response of registerListener
----	-----------------	---

##### Returns

Status of registerListener i.e success or suitable status code.

#### 5.28.1.21.2.5 virtual telux::common::Status telux::audio::IAudioPlayStream::deRegisterListener ( std::weak\_ptr< IPlayListener > *listener* ) [pure virtual]

Remove a previously registered listener.

##### Parameters

in	<i>listener</i>	Previously registered <a href="#">IPlayListener</a> that needs to be removed
----	-----------------	--

##### Returns

Status of deRegisterListener, success or suitable status code

### 5.28.1.22 class telux::audio::IAudioCaptureStream

[IAudioCaptureStream](#) represents single audio capture stream.

##### Public member functions

- virtual std::shared\_ptr< [IStreamBuffer](#) > [getStreamBuffer](#) ()=0
- virtual [telux::common::Status read](#) (std::shared\_ptr< [IStreamBuffer](#) > buffer, uint32\_t bytesToRead, [ReadResponseCb](#) callback=nullptr)=0
- virtual [~IAudioCaptureStream](#) ()

#### 5.28.1.22.1 Constructors and Destructors

##### 5.28.1.22.1.1 virtual telux::audio::IAudioCaptureStream::~~IAudioCaptureStream ( ) [virtual]

#### 5.28.1.22.2 Member Function Documentation

##### 5.28.1.22.2.1 virtual std::shared\_ptr<IStreamBuffer> telux::audio::IAudioCaptureStream::getStreamBuffer ( ) [pure virtual]

Get an Audio Stream Buffer to be used for capture operations

**Returns**

an Audio Buffer or nullptr in case of failure

**5.28.1.22.2** `virtual telux::common::Status telux::audio::IAudioCaptureStream::read ( std::shared_ptr< IStreamBuffer > buffer, uint32_t bytesToRead, ReadResponseCb callback = nullptr ) [pure virtual]`

Read Samples from audio stream. First read starts capture operation.

**Parameters**

in	<i>buffer</i>	stream buffer for read.
in	<i>bytesToRead</i>	specifying how many bytes to be read from stream.
in	<i>callback</i>	callback to get the response of read.

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.23 class telux::audio::IAudioLoopbackStream**

[IAudioLoopbackStream](#) represents audio loopback stream.

**Public member functions**

- virtual [telux::common::Status startLoopback](#) ([telux::common::ResponseCallback](#) *callback*=nullptr)=0
- virtual [telux::common::Status stopLoopback](#) ([telux::common::ResponseCallback](#) *callback*=nullptr)=0
- virtual [~IAudioLoopbackStream](#) ()

**5.28.1.23.1 Constructors and Destructors**

**5.28.1.23.1.1** `virtual telux::audio::IAudioLoopbackStream::~~IAudioLoopbackStream ( ) [virtual]`

**5.28.1.23.2 Member Function Documentation**

**5.28.1.23.2.1** `virtual telux::common::Status telux::audio::IAudioLoopbackStream::startLoopback ( telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Start loopback between source and sink devices

**Parameters**

in	<i>callback</i>	callback to get the response of start loopback.
----	-----------------	---

**Returns**

Status of the request i.e. success or suitable status code.

### 5.28.1.23.2.2 virtual telux::common::Status telux::audio::IAudioLoopbackStream::stopLoopback ( telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]

Stop loopback between source and sink devices

#### Parameters

in	<i>callback</i>	callback to get the response of stop loopback.
----	-----------------	--

#### Returns

Status of the request i.e. success or suitable status code.

### 5.28.1.24 class telux::audio::IAudioToneGeneratorStream

[IAudioToneGeneratorStream](#) represents tone generator stream.

#### Public member functions

- virtual [telux::common::Status playTone](#) (std::vector< uint16\_t > *freq*, uint16\_t *duration*, uint16\_t *gain*, [telux::common::ResponseCallback](#) *callback*=nullptr)=0
- virtual [telux::common::Status stopTone](#) ([telux::common::ResponseCallback](#) *callback*=nullptr)=0
- virtual [~IAudioToneGeneratorStream](#) ()

#### 5.28.1.24.1 Constructors and Destructors

##### 5.28.1.24.1.1 virtual telux::audio::IAudioToneGeneratorStream::~~IAudioToneGeneratorStream ( ) [virtual]

#### 5.28.1.24.2 Member Function Documentation

##### 5.28.1.24.2.1 virtual telux::common::Status telux::audio::IAudioToneGeneratorStream::playTone ( std::vector< uint16\_t > *freq*, uint16\_t *duration*, uint16\_t *gain*, [telux::common::ResponseCallback](#) *callback* = nullptr ) [pure virtual]

Play a tone on sink devices. As the duration expires, the generated tone terminates automatically.

#### Parameters

in	<i>freq</i>	Accepts the composition of frequencies (in Hz) to be played such as single tone or dual tone. Any additional frequencies provided will be ignored.
in	<i>duration</i>	Duration (in milliseconds) for which the tone needs to be played. The constant infiniteToneDuration(=0xFFFF) represents infinite duration.
in	<i>gain</i>	Tone Gain.
in	<i>callback</i>	callback to get the response of play tone.

**Returns**

Status of the request i.e. success or suitable status code.

#### 5.28.1.24.2.2 `virtual telux::common::Status telux::audio::IAudioToneGeneratorStream::stopTone ( telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Stops the tone which is being played (i.e duration not expired) on the active Tone generator stream.

**Parameters**

<i>in</i>	<i>callback</i>	callback to get the response of stop tone.
-----------	-----------------	--

**Returns**

Status of the request i.e. success or suitable status code.

#### 5.28.1.25 `class telux::audio::ITranscoder`

[ITranscoder](#) is used to convert one audio format to another audio format using the transcoding operation.

**Public member functions**

- virtual `std::shared_ptr< IAudioBuffer > getWriteBuffer ()=0`
- virtual `std::shared_ptr< IAudioBuffer > getReadBuffer ()=0`
- virtual `telux::common::Status write (std::shared_ptr< IAudioBuffer > buffer, uint32_t isLastBuffer, TranscoderWriteResponseCb callback=nullptr)=0`
- virtual `telux::common::Status tearDown (telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status read (std::shared_ptr< IAudioBuffer > buffer, uint32_t bytesToRead, TranscoderReadResponseCb callback=nullptr)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< ITranscodeListener > listener)=0`
- virtual `telux::common::Status deRegisterListener (std::weak_ptr< ITranscodeListener > listener)=0`
- virtual `~ITranscoder ()`

#### 5.28.1.25.1 Constructors and Destructors

##### 5.28.1.25.1.1 `virtual telux::audio::ITranscoder::~ITranscoder ( ) [virtual]`

#### 5.28.1.25.2 Member Function Documentation

**5.28.1.25.2.1** `virtual std::shared_ptr<IAudioBuffer> telux::audio::ITranscoder::getWriteBuffer ( )`  
`[pure virtual]`

Get a buffer to be used for writing samples for transcoding operation.

**Returns**

a buffer or nullptr in case of failure.

**5.28.1.25.2.2** `virtual std::shared_ptr<IAudioBuffer> telux::audio::ITranscoder::getReadBuffer ( )`  
`[pure virtual]`

Get a buffer to be used for reading samples from transcoding operation.

**Returns**

a buffer or nullptr in case of failure.

**5.28.1.25.2.3** `virtual telux::common::Status telux::audio::ITranscoder::write ( std::shared_ptr<IAudioBuffer > buffer, uint32_t isLastBuffer, TranscoderWriteResponseCb callback = nullptr )` `[pure virtual]`

Write Samples/Frames to transcode stream. First write starts transcoding operation.

Write in case of compressed audio format maintains a pipeline, if the callback returns with same number of bytes written as requested and no error occurred, user can send next buffer. If the number of bytes returned are not equal to the requested write size, then user needs to resend the buffer again from the leftover offset after waiting for the () event.

**Parameters**

in	<i>buffer</i>	buffer that needs to be transcoded.
in	<i>isLastBuffer</i>	represents whether this buffer is last buffer or not. Once last buffer is set no more write operations are required.
in	<i>callback</i>	callback to get the response of write.

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.25.2.4** `virtual telux::common::Status telux::audio::ITranscoder::tearDown ( telux::common::ResponseCallback callback = nullptr )` `[pure virtual]`

It is mandatory to call this API after the end of a transcode operation or to abort a transcode operation. After this API call the [ITranscoder](#) object is no longer usable.

**Parameters**

in	<i>callback</i>	callback to get the response of tearDown.
----	-----------------	---

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.25.2.5** `virtual telux::common::Status telux::audio::ITranscoder::read ( std::shared_ptr< IAudioBuffer > buffer, uint32_t bytesToRead, TranscoderReadResponseCb callback = nullptr ) [pure virtual]`

Reads samples/Frames from transcoder during transcoding operation.

**Parameters**

in	<i>buffer</i>	stream buffer for read.
in	<i>bytesToRead</i>	specifying how many bytes to be read from stream.
in	<i>callback</i>	callback to get the response of read.

**Returns**

Status of the request i.e. success or suitable status code.

**5.28.1.25.2.6** `virtual telux::common::Status telux::audio::ITranscoder::registerListener ( std::weak_ptr< ITranscodeListener > listener ) [pure virtual]`

Register a listener to get notified for events of Transcoder.

**Parameters**

in	<i>listener</i>	Pointer of <a href="#">ITranscodeListener</a> object that processes the notification.
----	-----------------	---

**Returns**

Status of registerListener i.e success or suitable status code.

**5.28.1.25.2.7** `virtual telux::common::Status telux::audio::ITranscoder::deRegisterListener ( std::weak_ptr< ITranscodeListener > listener ) [pure virtual]`

Remove a previously registered listener.

**Parameters**

in	<i>listener</i>	Previously registered <a href="#">ITranscodeListener</a> that needs to be removed.
----	-----------------	--

**Returns**

Status of deRegisterListener, success or suitable status code.

## 5.28.2 Enumeration Type Documentation

### 5.28.2.1 enum telux::audio::DeviceType

Represent type of device like SPEAKER, MIC, etc.

#### Enumerator

**DEVICE\_TYPE\_NONE**  
**DEVICE\_TYPE\_SPEAKER**  
**DEVICE\_TYPE\_MIC**

### 5.28.2.2 enum telux::audio::DeviceDirection [strong]

Represent Device Direction RX (Sink), Tx (Source)

#### Enumerator

**NONE**  
**RX**  
**TX**

### 5.28.2.3 enum telux::audio::Direction [strong]

Represent Voice Direction RX (Sink), Tx (Source)

#### Enumerator

**RX**  
**TX**

### 5.28.2.4 enum telux::audio::StreamType [strong]

Represent Stream Type

#### Enumerator

**NONE**  
**VOICE\_CALL** Voice Call, Provides Audio Session for an active Voice  
**PLAY** Playback, Provides Audio Playback Session  
**CAPTURE** Capture, Provides Audio Capture/Record Session  
**LOOPBACK** Loopback, Provides loopback between source and sink devices  
**TONE\_GENERATOR** Tone Generator, Generates tone on sink device

### 5.28.2.5 enum telux::audio::StreamDirection [strong]

Represent Stream Direction

#### Enumerator

**NONE**  
**RX** Represents Session Directed towards Sink Device

**TX** Represents Session Directed from Source Device

### 5.28.2.6 enum telux::audio::ChannelType

Represent Stream's types of Channel

#### Enumerator

**LEFT** Represents left channel

**RIGHT** Represents right channel

### 5.28.2.7 enum telux::audio::AudioFormat [strong]

Specifies Stream data format

#### Enumerator

**UNKNOWN** Unknown format

**PCM\_16BIT\_SIGNED** 16 bit signed PCM format

**AMRNB** AMRNB format

**AMRWB** AMRWB format

**AMRWB\_PLUS** AMRWB+ format

### 5.28.2.8 enum telux::audio::DtmfLowFreq [strong]

Represents the possible lower frequencies(in Hz) in a standard DTMF tone

#### Enumerator

**FREQ\_697**

**FREQ\_770**

**FREQ\_852**

**FREQ\_941**

### 5.28.2.9 enum telux::audio::DtmfHighFreq [strong]

Represents the possible higher frequencies(in Hz) in a standard DTMF tone

#### Enumerator

**FREQ\_1209**

**FREQ\_1336**

**FREQ\_1477**

**FREQ\_1633**

### 5.28.2.10 enum telux::audio::AmrwbpFrameFormat [strong]

Representative of type of frame structure. Typical transport interface or file storage.

**Enumerator**

**UNKNOWN** Unknown format  
**TRANSPORT\_INTERFACE\_FORMAT**  
**FILE\_STORAGE\_FORMAT**

**5.28.2.11 enum telux::audio::StopType [strong]**

Represents type of stop for compressed audio format playback. Audio playback can be stopped in two ways force stop and after playing all buffers in the pipeline.

**Enumerator**

**FORCE\_STOP** Stop Playing Immediately and clear buffer pipeline  
**STOP\_AFTER\_PLAY** Stop Play once after all buffers in pipeline are played

**5.28.2.12 enum telux::audio::EcnrMode [strong]**

Enable/Disable ECNR(Echo Cancellation and Noise Reduction) on the audio stream. When enabling this the audio stream should be associated with devices that are capable of doing ECNR. It is only applicable to [StreamType::VOICE\\_CALL](#).

**Enumerator**

**DISABLE** To disable the ECNR mode  
**ENABLE** To enable the ECNR mode. Applicable only to [StreamType::VOICE\\_CALL](#)

**5.28.2.13 enum telux::audio::CalibrationInitStatus [strong]**

Represents state of Audio calibration initialization in system. API gives status that tells whether the calibration initialized by audio sub system.

**Enumerator**

**UNKNOWN** calibration initialization status is unknown  
**INIT\_SUCCESS** calibration initialized successfully  
**INIT\_FAILED** calibration initialization failed

## 5.29 therm

- [Thermal Management](#)
- [Thermal Shutdown Management](#)

This section contains APIs related to thermal.

## 5.30 Thermal Management

This section contains APIs related to Thermal Management such as read list of thermal zones, cooling devices and binding info.

### 5.30.1 Data Structure Documentation

#### 5.30.1.1 class telux::therm::ThermalFactory

[ThermalFactory](#) allows creation of thermal manager.

##### Public member functions

- virtual `std::shared_ptr< IThermalManager > getThermalManager (telux::common::InitResponseCb callback=nullptr, telux::common::ProcType operType=telux::common::ProcType::LOCAL_PROC)=0`
- virtual `std::shared_ptr< IThermalShutdownManager > getThermalShutdownManager (telux::common::InitResponseCb callback=nullptr)=0`

##### Static Public Member Functions

- static `ThermalFactory & getInstance ()`

##### Protected Member Functions

- `ThermalFactory ()`
- virtual `~ThermalFactory ()`

#### 5.30.1.1.1 Constructors and Destructors

5.30.1.1.1.1 `telux::therm::ThermalFactory::ThermalFactory ( ) [protected]`

5.30.1.1.1.2 `virtual telux::therm::ThermalFactory::~~ThermalFactory ( ) [protected], [virtual]`

#### 5.30.1.1.2 Member Function Documentation

5.30.1.1.2.1 `static ThermalFactory& telux::therm::ThermalFactory::getInstance ( ) [static]`

Get Thermal Factory instance.

5.30.1.1.2.2 `virtual std::shared_ptr<IThermalManager> telux::therm::ThermalFactory::getThermalManager ( telux::common::InitResponseCb callback = nullptr, telux::common::ProcType operType = telux::common::ProcType::LOCAL_PROC ) [pure virtual]`

Get thermal manager instance associated with a `telux::common::ProcType` to get list of thermal zones (sensors) and cooling devices supported by the device

in	<i>callback</i>	Optional callback pointer to get the response of the manager initialization.
in	<i>oprType</i>	Operation type <a href="#">telux::common::ProcType</a> . Local operation type fetches the thermal zones information where the application is running. Remote operation type fetches the thermal zones information of modem if the application is running on external application processor(EAP) and vice versa.

**Returns**

Pointer of [IThermalManager](#) object.

```
5.30.1.1.2.3 virtual std::shared_ptr<IThermalShutdownManager> telux::therm::ThermalFactory::get←
ThermalShutdownManager ( telux::common::InitResponseCb callback = nullptr )
[pure virtual]
```

Get thermal shutdown manager instance to control automatic thermal shutdown and get relevant notifications

**Parameters**

in	<i>callback</i>	Optional callback pointer to get the response of the manager initialization.
----	-----------------	--

**Returns**

Pointer of [IThermalShutdownManager](#) object.

**5.30.1.2 class telux::therm::IThermalListener**

Listener class for getting notifications when thermal service status changes. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe.

**Public member functions**

- virtual [~IThermalListener](#) ()

**5.30.1.2.1 Constructors and Destructors**

```
5.30.1.2.1.1 virtual telux::therm::IThermalListener::~~IThermalListener ( ) [virtual]
```

Destructor of [IThermalListener](#)

**5.30.1.3 struct telux::therm::BoundCoolingDevice**

Defines the trip points to which cooling device is bound.

**Data fields**

Type	Field	Description
int	cooling↔ DeviceId	Cooling device Id associated with trip points
vector< shared_ptr< ITripPoint > >	bindingInfo	List of trippoints bound to the cooling device

**5.30.1.4 class telux::therm::IThermalManager**

[IThermalManager](#) provides interface to get thermal zone and cooling device information.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [IThermalListener](#) > listener)=0
- virtual [telux::common::Status](#) deregisterListener (std::weak\_ptr< [IThermalListener](#) > listener)=0
- virtual std::vector< std::shared\_ptr< [IThermalZone](#) > > [getThermalZones](#) ()=0
- virtual std::vector< std::shared\_ptr< [ICoolingDevice](#) > > [getCoolingDevices](#) ()=0
- virtual std::shared\_ptr< [IThermalZone](#) > [getThermalZone](#) (int thermalZoneId)=0
- virtual std::shared\_ptr< [ICoolingDevice](#) > [getCoolingDevice](#) (int coolingDeviceId)=0
- virtual [~IThermalManager](#) ()

**5.30.1.4.1 Constructors and Destructors**

**5.30.1.4.1.1** virtual [telux::therm::IThermalManager::~IThermalManager](#) ( ) [**virtual**]

Destructor of [IThermalManager](#)

**5.30.1.4.2 Member Function Documentation**

**5.30.1.4.2.1** virtual [telux::common::ServiceStatus](#) [telux::therm::IThermalManager::getServiceStatus](#) ( ) [**pure virtual**]

This status indicates whether the object is in a usable state.

**Returns**

[telux::common::ServiceStatus](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.30.1.4.2.2** `virtual telux::common::Status telux::therm::IThermalManager::registerListener ( std::weak_ptr< IThermalListener > listener ) [pure virtual]`

Registers the listener for Thermal Manager indications.

#### Parameters

in	<i>listener</i>	- pointer to implemented listener.
----	-----------------	------------------------------------

#### Returns

status of the registration request.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.30.1.4.2.3** `virtual telux::common::Status telux::therm::IThermalManager::deregisterListener ( std::weak_ptr< IThermalListener > listener ) [pure virtual]`

Deregisters the previously registered listener.

#### Parameters

in	<i>listener</i>	- pointer to registered listener that needs to be removed.
----	-----------------	--

#### Returns

status of the deregistration request.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.30.1.4.2.4** `virtual std::vector<std::shared_ptr<IThermalZone> > telux::therm::IThermalManager↔::getThermalZones ( ) [pure virtual]`

Retrieves the list of thermal zone info like type, temperature and trip points.

#### Returns

List of thermal zones.

**5.30.1.4.2.5** `virtual std::vector<std::shared_ptr<ICoolingDevice> > telux::therm::IThermalManager↔  
::getCoolingDevices ( ) [pure virtual]`

Retrieves the list of thermal cooling device info like type, maximum throttle state and currently requested throttle state.

#### Returns

List of cooling devices.

**5.30.1.4.2.6** `virtual std::shared_ptr<IThermalZone> telux::therm::IThermalManager::getThermalZone (   
int thermalZoneId ) [pure virtual]`

Retrieves the thermal zone details like temperature, type and trip point info for the given thermal zone identifier.

#### Parameters

in	<i>thermalZoneId</i>	Thermal zone identifier
----	----------------------	-------------------------

#### Returns

Pointer to thermal zone.

**5.30.1.4.2.7** `virtual std::shared_ptr<ICoolingDevice> telux::therm::IThermalManager↔::getCooling↔  
Device ( int coolingDeviceId ) [pure virtual]`

Retrieves the cooling device details like type of the device, maximum cooling level and current cooling level for the given cooling device identifier.

#### Parameters

in	<i>coolingDeviceId</i>	Cooling device identifier
----	------------------------	---------------------------

#### Returns

Pointer to cooling device.

### 5.30.1.5 class telux::therm::ITripPoint

[ITripPoint](#) provides interface to get trip point type, trip point temperature and hysteresis value for that trip point.

#### Public member functions

- virtual [TripType](#) `getType () const =0`
- virtual int `getThresholdTemp () const =0`
- virtual int `getHysteresis () const =0`

- virtual bool `operator==` (const [ITripPoint](#) &rHs) const =0
- virtual `~ITripPoint` ()

### 5.30.1.5.1 Constructors and Destructors

**5.30.1.5.1.1** virtual `telux::therm::ITripPoint::~ITripPoint` ( ) [`virtual`]

Destructor of [ITripPoint](#)

### 5.30.1.5.2 Member Function Documentation

**5.30.1.5.2.1** virtual `TripType telux::therm::ITripPoint::getType` ( ) const [`pure virtual`]

Retrieves trip point type.

#### Returns

Type of trip point if available else return UNKNOWN.

- [TripType](#)

**5.30.1.5.2.2** virtual `int telux::therm::ITripPoint::getThresholdTemp` ( ) const [`pure virtual`]

Retrieves the temperature above which certain trip point will be fired.

- Units: MilliDegree Celsius

#### Returns

Threshold temperature

**5.30.1.5.2.3** virtual `int telux::therm::ITripPoint::getHysteresis` ( ) const [`pure virtual`]

Retrieves hysteresis value that is the difference between current temperature of the device and the temperature above which certain trip point will be fired. Units: MilliDegree Celsius

#### Returns

Hysteresis value

**5.30.1.5.2.4** virtual `bool telux::therm::ITripPoint::operator==` ( const [ITripPoint](#) & *rHs* ) const [`pure virtual`]

Operator for compare two trip points

#### Returns

result of two trip points whether equal or not equal.

### 5.30.1.6 class telux::therm::IThermalZone

[IThermalZone](#) provides interface to get type of the sensor, the current temperature reading, trip points and the cooling devices binded etc.

#### Public member functions

- virtual int [getId](#) () const =0
- virtual std::string [getDescription](#) () const =0
- virtual int [getCurrentTemp](#) () const =0
- virtual int [getPassiveTemp](#) () const =0
- virtual std::vector< std::shared\_ptr< [ITripPoint](#) > > [getTripPoints](#) () const =0
- virtual std::vector< [BoundCoolingDevice](#) > [getBoundCoolingDevices](#) () const =0
- virtual [~IThermalZone](#) ()

#### 5.30.1.6.1 Constructors and Destructors

5.30.1.6.1.1 virtual telux::therm::IThermalZone::~IThermalZone ( ) [virtual]

Destructor of [IThermalZone](#)

#### 5.30.1.6.2 Member Function Documentation

5.30.1.6.2.1 virtual int telux::therm::IThermalZone::getId ( ) const [pure virtual]

Retrieves the identifier for thermal zone.

#### Returns

Identifier for thermal zone

5.30.1.6.2.2 virtual std::string telux::therm::IThermalZone::getDescription ( ) const [pure virtual]

Retrieves the type of sensor.

#### Returns

Sensor type

**5.30.1.6.2.3 virtual int telux::therm::IThermalZone::getCurrentTemp ( ) const [pure virtual]**

Retrieves the current temperature of the device. Units: MilliDegree Celsius

**Returns**

Current temperature

**5.30.1.6.2.4 virtual int telux::therm::IThermalZone::getPassiveTemp ( ) const [pure virtual]**

Retrieves the temperature of passive trip point for the zone. Default value is 0. Valid values: 0 (disabled) or greater than 1000 (enabled), Units: MilliDegree Celsius

**Returns**

Temperature of passive trip point

**5.30.1.6.2.5 virtual std::vector<std::shared\_ptr<ITripPoint> > telux::therm::IThermalZone::getTripPoints ( ) const [pure virtual]**

Retrieves trip point information like trip type, trip temperature and hysteresis.

**Returns**

Trip point info list

**5.30.1.6.2.6 virtual std::vector<BoundCoolingDevice> telux::therm::IThermalZone::getBoundCoolingDevices ( ) const [pure virtual]**

Retrieves the list of cooling device and the associated trip points bound to cooling device in given thermal zone.

**Returns**

List of bound cooling device for the given thermal zone.

**5.30.1.7 class telux::therm::ICoolingDevice**

[ICoolingDevice](#) provides interface to get type of the cooling device, the maximum throttle state and the currently requested throttle state of the cooling device.

**Public member functions**

- virtual int [getId](#) ( ) const =0
- virtual std::string [getDescription](#) ( ) const =0
- virtual int [getMaxCoolingLevel](#) ( ) const =0
- virtual int [getCurrentCoolingLevel](#) ( ) const =0

- virtual `~ICoolingDevice()`

### 5.30.1.7.1 Constructors and Destructors

**5.30.1.7.1.1** virtual `telux::therm::ICoolingDevice::~~ICoolingDevice()` [virtual]

Destructor of `ICoolingDevice`

### 5.30.1.7.2 Member Function Documentation

**5.30.1.7.2.1** virtual `int telux::therm::ICoolingDevice::getId()` const [pure virtual]

Retrieves the identifier of the thermal cooling device.

#### Returns

Cooling device identifier

**5.30.1.7.2.2** virtual `std::string telux::therm::ICoolingDevice::getDescription()` const [pure virtual]

Retrieves the type of the cooling device.

#### Returns

Cooling device type

**5.30.1.7.2.3** virtual `int telux::therm::ICoolingDevice::getMaxCoolingLevel()` const [pure virtual]

Retrieves the maximum cooling level of the cooling device.

#### Returns

Maximum cooling level of the thermal cooling device

**5.30.1.7.2.4** virtual `int telux::therm::ICoolingDevice::getCurrentCoolingLevel()` const [pure virtual]

Retrieves the current cooling level of the cooling device. This value can be between 0 and max cooling level. Max cooling level is different for different cooling devices like fan, processor etc.

#### Returns

Current cooling level of the thermal cooling device

## 5.30.2 Enumeration Type Documentation

### 5.30.2.1 enum telux::therm::AutoShutdownMode [strong]

Defines the status of automatic thermal shutdown

#### Enumerator

- UNKNOWN** Automatic thermal shutdown status is unknown
- ENABLE** Automatic thermal shutdown is enabled
- DISABLE** Automatic thermal shutdown is disabled

### 5.30.2.2 enum telux::therm::TripType [strong]

Defines the type of trip points, it can be one of the values for ACPI (Advanced Configuration and Power Interface) thermal zone

#### Enumerator

- UNKNOWN** Trip type is unknown
- CRITICAL** Trip point at which system shuts down
- HOT** Trip point to notify emergency
- PASSIVE** Trip point at which kernel lowers the CPU's frequency and throttle the processor down
- ACTIVE** Trip point at which processor fan turns on
- CONFIGURABLE\_HIGH** Triggering threshold at which mitigation starts. This type is added to support legacy targets
- CONFIGURABLE\_LOW** Clearing threshold at which mitigation stops. This type is added to support legacy targets

## 5.30.3 Variable Documentation

### 5.30.3.1 const uint32\_t telux::therm::DEFAULT\_TIMEOUT = 30

Default time out (in seconds) for thermal auto-shutdown service to re-enable thermal auto-shutdown.

## 5.31 Thermal Shutdown Management

This section contains APIs related to Thermal Shutdown Management such as set/get thermal auto-shutdown mode, receive notifications on every auto-shutdown update.

### 5.31.1 Data Structure Documentation

#### 5.31.1.1 class `telux::therm::IThermalShutdownListener`

Listener class for getting notifications when automatic thermal shutdown mode is enabled/ disabled or will be enabled imminently. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe.

##### Public member functions

- virtual void `onShutdownEnabled ()`
- virtual void `onShutdownDisabled ()`
- virtual void `onImminentShutdownEnablement (uint32_t imminentDuration)`
- virtual `~IThermalShutdownListener ()`

##### 5.31.1.1.1 Constructors and Destructors

**5.31.1.1.1.1** virtual `telux::therm::IThermalShutdownListener::~~IThermalShutdownListener ( )`  
[`virtual`]

Destructor of `IThermalShutdownListener`

##### 5.31.1.1.2 Member Function Documentation

**5.31.1.1.2.1** virtual void `telux::therm::IThermalShutdownListener::onShutdownEnabled ( )`  
[`virtual`]

This function is called when the automatic shutdown mode changes to ENABLE

**5.31.1.1.2.2** virtual void `telux::therm::IThermalShutdownListener::onShutdownDisabled ( )`  
[`virtual`]

This function is called when the automatic shutdown mode changes to DISABLE

**5.31.1.1.2.3** virtual void `telux::therm::IThermalShutdownListener::onImminentShutdownEnablement ( uint32_t imminentDuration )` [`virtual`]

This function is called when the automatic shutdown mode is about to change to ENABLE. Clients that want to keep the shutdown mode disabled, needs to set it accordingly with in the `imminentDuration` time. If disabled successfully within `imminentDuration` time, the system timer for auto-enablement will be reset.

in	<i>imminentDuration</i>	Time elapsed(in seconds) for the shutdown mode to be enabled
----	-------------------------	--

### 5.31.1.2 class telux::therm::IThermalShutdownManager

[IThermalShutdownManager](#) class provides interface to enable/disable automatic thermal shutdown. Additionally it facilitates to register for notifications when the automatic shutdown mode changes.

#### Public member functions

- virtual bool [isReady](#) ()=0
- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual std::future< bool > [onReady](#) ()=0
- virtual [telux::common::Status](#) [registerListener](#) (std::weak\_ptr< [IThermalShutdownListener](#) > listener)=0
- virtual [telux::common::Status](#) [deregisterListener](#) (std::weak\_ptr< [IThermalShutdownListener](#) > listener)=0
- virtual [telux::common::Status](#) [setAutoShutdownMode](#) ([AutoShutdownMode](#) mode, [telux::common::ResponseCallback](#) callback=nullptr, uint32\_t timeout=[DEFAULT\\_TIMEOUT](#))=0
- virtual [telux::common::Status](#) [getAutoShutdownMode](#) ([GetAutoShutdownModeResponseCb](#) callback)=0
- virtual [~IThermalShutdownManager](#) ()

#### 5.31.1.2.1 Constructors and Destructors

**5.31.1.2.1.1** virtual [telux::therm::IThermalShutdownManager::~IThermalShutdownManager](#) ( )  
[virtual]

Destructor of [IThermalShutdownManager](#)

#### 5.31.1.2.2 Member Function Documentation

**5.31.1.2.2.1** virtual bool [telux::therm::IThermalShutdownManager::isReady](#) ( ) [pure virtual]

Checks the status of thermal shutdown management service and if the other APIs are ready for use and returns the result.

#### Returns

True if the services are ready otherwise false.

**Deprecated** use [getServiceStatus\(\)](#)

**5.31.1.2.2.2** `virtual telux::common::ServiceStatus telux::therm::IThermalShutdownManager::getServiceStatus ( ) [pure virtual]`

This status indicates whether the object is in a usable state.

#### Returns

[telux::common::ServiceStatus](#)

**5.31.1.2.2.3** `virtual std::future<bool> telux::therm::IThermalShutdownManager::onReady ( ) [pure virtual]`

Wait for thermal shutdown management service to be ready.

#### Returns

A future that caller can wait on to be notified when thermal shutdown management service is ready.

**Deprecated** The callback mechanism introduced in the [ThermalFactory::getThermalShutdownManager](#) with initialization callback along with [getServiceStatus](#) API will provide the similar mechanism as [onReady](#) and [isReady](#). This API will soon be removed from further releases.

**5.31.1.2.2.4** `virtual telux::common::Status telux::therm::IThermalShutdownManager::registerListener ( std::weak_ptr< IThermalShutdownListener > listener ) [pure virtual]`

Register a listener for updates on automatic shutdown mode changes

#### Parameters

<i>in</i>	<i>listener</i>	Pointer of <a href="#">IThermalShutdownListener</a> object that processes the notification
-----------	-----------------	--

#### Returns

Status of registerListener i.e success or suitable status code.

**5.31.1.2.2.5** `virtual telux::common::Status telux::therm::IThermalShutdownManager::deregisterListener ( std::weak_ptr< IThermalShutdownListener > listener ) [pure virtual]`

Remove a previously registered listener.

#### Parameters

<i>in</i>	<i>listener</i>	Previously registered <a href="#">IThermalShutdownListener</a> that needs to be removed
-----------	-----------------	---

#### Returns

Status of deregisterListener, success or suitable status code

**5.31.1.2.2.6** `virtual telux::common::Status telux::therm::IThermalShutdownManager::setAuto↔  
ShutdownMode ( AutoShutdownMode mode, telux::common::ResponseCallback callback  
= nullptr, uint32_t timeout = DEFAULT_TIMEOUT ) [pure virtual]`

Set automatic thermal shutdown mode. When set to DISABLE mode successfully, it remains in DISABLE mode briefly and automatically changes to ENABLE mode after notifying the clients.

#### Parameters

in	<i>mode</i>	desired AutoShutdownMode to be set
in	<i>callback</i>	Optional callback to get the response of the command
in	<i>timeout</i>	Optional timeout(in seconds) for which auto-shutdown remains disabled.

#### Returns

Status of setAutoShutdownMode i.e. success or suitable status code.

**5.31.1.2.2.7** `virtual telux::common::Status telux::therm::IThermalShutdownManager::get↔  
AutoShutdownMode ( GetAutoShutdownModeResponseCb callback ) [pure  
virtual]`

Get automatic thermal shutdown mode.

#### Parameters

in	<i>callback</i>	GetAutoShutdownModeResponseCb to get response of the request
----	-----------------	--

#### Returns

Status of getAutoShutdownMode i.e. success or suitable status code.

## 5.32 power

- [TCU Activity Manager](#)

This section contains APIs related to power.

## 5.33 TCU Activity Manager

This section contains APIs related to TCU activity state management.

### 5.33.1 Data Structure Documentation

#### 5.33.1.1 class `telux::power::PowerFactory`

`PowerFactory` allows creation of TCU-activity manager instance.

##### Public member functions

- `std::shared_ptr< ITcuActivityManager > getTcuActivityManager (ClientType clientType=ClientType::SLAVE, common::ProcType procType=common::ProcType::LOCAL_PROC, telux::common::InitResponseCb callback=nullptr)`

##### Static Public Member Functions

- static `PowerFactory & getInstance ()`

#### 5.33.1.1.1 Member Function Documentation

##### 5.33.1.1.1.1 static `PowerFactory& telux::power::PowerFactory::getInstance ( ) [static]`

API to get the factory instance for TCU-activity management

##### 5.33.1.1.1.2 `std::shared_ptr<ITcuActivityManager> telux::power::PowerFactory::getTcuActivityManager ( ClientType clientType = ClientType::SLAVE, common::ProcType procType = common::ProcType::LOCAL_PROC, telux::common::InitResponseCb callback = nullptr )`

API to get the TCU-activity Manager instance

##### Parameters

in	<i>type</i>	Type of the client that is going to access <code>ITcuActivityManager</code> APIs <code>ClientType</code>
in	<i>procType</i>	Required processor type on which the operations will be performed <code>telux::common::ProcType</code>
in	<i>callback</i>	Optional callback pointer to get the response of the manager initialization.

##### Returns

Pointer of `ITcuActivityManager` object.

### 5.33.1.2 class telux::power::ITcuActivityListener

Listener class for getting notifications related to TCU-activity state and also the updates related to TCU-activity service status. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe.

#### Public member functions

- virtual void `onTcuActivityStateUpdate` (`TcuActivityState` state)
- virtual void `onSlaveAckStatusUpdate` (`telux::common::Status` status)
- virtual `~ITcuActivityListener` ()

#### 5.33.1.2.1 Constructors and Destructors

**5.33.1.2.1.1** virtual `telux::power::ITcuActivityListener::~~ITcuActivityListener` ( ) [`virtual`]

Destructor of `ITcuActivityListener`

#### 5.33.1.2.2 Member Function Documentation

**5.33.1.2.2.1** virtual void `telux::power::ITcuActivityListener::onTcuActivityStateUpdate` ( `TcuActivity↔  
State` *state* ) [`virtual`]

This function is called when the TCU-activity state is going to change.

#### Parameters

in	<i>state</i>	TCU-activity state that system is about to enter
----	--------------	--

**5.33.1.2.2.2** virtual void `telux::power::ITcuActivityListener::onSlaveAckStatusUpdate` ( `telux↔  
::common::Status` *status* ) [`virtual`]

This function is called with the overall acknowledgement status from all the SLAVE clients, for state change triggered previously by MASTER client.

This API will be invoked only for the MASTER client. If at least one SLAVE client does not acknowledge within the configured timeout, then `Status::EXPIRED` would be reported.

#### Parameters

in	<i>status</i>	status of the SLAVE clients acknowledgements
----	---------------	--

### 5.33.1.3 class telux::power::ITcuActivityManager

[ITcuActivityManager](#) provides interface to register and de-register listeners to get TCU-activity state updates. And also API to initiate TCU-activity state transition. The system can be configured to be operated in ACTIVE or PASSIVE mode with respect to TcuActivity management. In ACTIVE mode, the TCU-activity management service leads the system into desired activity state after receiving the acknowledgements from all the clients or after the configured timeout. In PASSIVE mode, the management service just notifies the clients about the state transition and conveys their acknowledgement status back to the Master application that triggered the state transition.

#### Public member functions

- virtual bool [isReady](#) ()=0
- virtual std::future< bool > [onReady](#) ()=0
- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual [telux::common::Status](#) [registerListener](#) (std::weak\_ptr< [ITcuActivityListener](#) > listener)=0
- virtual [telux::common::Status](#) [deregisterListener](#) (std::weak\_ptr< [ITcuActivityListener](#) > listener)=0
- virtual [telux::common::Status](#) [registerServiceStateListener](#) (std::weak\_ptr< [telux::common::IServiceStatusListener](#) > listener)=0
- virtual [telux::common::Status](#) [deregisterServiceStateListener](#) (std::weak\_ptr< [telux::common::IServiceStatusListener](#) > listener)=0
- virtual [telux::common::Status](#) [setActivityState](#) ([TcuActivityState](#) state, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [TcuActivityState](#) [getActivityState](#) ()=0
- virtual [telux::common::Status](#) [sendActivityStateAck](#) ([TcuActivityStateAck](#) ack)=0
- virtual [~ITcuActivityManager](#) ()

#### 5.33.1.3.1 Constructors and Destructors

5.33.1.3.1.1 virtual [telux::power::ITcuActivityManager::~ITcuActivityManager](#) ( ) [[virtual](#)]

Destructor of [ITcuActivityManager](#)

#### 5.33.1.3.2 Member Function Documentation

5.33.1.3.2.1 virtual bool [telux::power::ITcuActivityManager::isReady](#) ( ) [[pure virtual](#)]

Checks the status of TCU-activity services and if the other APIs are ready for use, and returns the result.

#### Returns

True if the services are ready otherwise false.

**Deprecated** Use `ITcuActivityManager::getServiceStatus()` API.  
[telux::power::ITcuActivityManager::getServiceStatus](#)

**5.33.1.3.2.2** `virtual std::future<bool> telux::power::ITcuActivityManager::onReady ( ) [pure virtual]`

Wait for TCU-activity services to be ready.

#### Returns

A future that caller can wait on to be notified when TCU-activity services are ready.

**Deprecated** Use `InitResponseCb` in [PowerFactory::getTcuActivityManager](#) instead, to get notified about subsystem readiness [telux::power::PowerFactory::getTcuActivityManager](#)

**5.33.1.3.2.3** `virtual telux::common::ServiceStatus telux::power::ITcuActivityManager::getServiceStatus ( ) [pure virtual]`

This status indicates whether the [ITcuActivityManager](#) object is in a usable state.

#### Returns

[telux::common::ServiceStatus](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.33.1.3.2.4** `virtual telux::common::Status telux::power::ITcuActivityManager::registerListener ( std::weak_ptr< ITcuActivityListener > listener ) [pure virtual]`

Register a listener for updates on TCU-activity state changes.

#### Parameters

in	<i>listener</i>	Pointer of <a href="#">ITcuActivityListener</a> object that processes the notification
----	-----------------	--

#### Returns

Status of `registerListener` i.e success or suitable status code.

**5.33.1.3.2.5** `virtual telux::common::Status telux::power::ITcuActivityManager::deregisterListener ( std::weak_ptr< ITcuActivityListener > listener ) [pure virtual]`

Remove a previously registered listener.

<i>in</i>	<i>listener</i>	Previously registered <a href="#">ITcuActivityListener</a> that needs to be removed
-----------	-----------------	---

#### Returns

Status of `deregisterListener`, success or suitable status code

**5.33.1.3.2.6** `virtual telux::common::Status telux::power::ITcuActivityManager::registerServiceStateListener ( std::weak_ptr< telux::common::IServiceStatusListener > listener ) [pure virtual]`

Register a listener for updates on TCU-activity management service status.

#### Parameters

<i>in</i>	<i>listener</i>	Pointer of <code>IServiceStatusListener</code> object that processes the notification
-----------	-----------------	---

#### Returns

Status of `registerServiceStateListener` i.e success or suitable status code.

**5.33.1.3.2.7** `virtual telux::common::Status telux::power::ITcuActivityManager::deregisterServiceStateListener ( std::weak_ptr< telux::common::IServiceStatusListener > listener ) [pure virtual]`

Remove a previously registered listener for service status updates.

#### Parameters

<i>in</i>	<i>listener</i>	Previously registered <code>IServiceStatusListener</code> that needs to be removed
-----------	-----------------	--

#### Returns

Status of `deregisterServiceStateListener`, success or suitable status code

**5.33.1.3.2.8** `virtual telux::common::Status telux::power::ITcuActivityManager::setActivityState ( TcuActivityState state, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Initiate a TCU-activity state transition.

This API needs to be used cautiously, as it could change the power-state of the system and may affect other processes.

This API is meant for clients that have instantiated the [ITcuActivityManager](#) instance using [ClientType::MASTER](#)

#### Parameters

in	<i>state</i>	TCU-activity state that the System is intended to enter
in	<i>callback</i>	Optional callback to get the response for the TCU-activity state transition command

#### Returns

Status of setActivityState i.e. success or suitable status code.

**5.33.1.3.2.9** `virtual TcuActivityState telux::power::ITcuActivityManager::getActivityState ( ) [pure virtual]`

Get the current TCU-activity state.

#### Returns

TcuActivityState

**5.33.1.3.2.10** `virtual telux::common::Status telux::power::ITcuActivityManager::sendActivityStateAck ( TcuActivityStateAck ack ) [pure virtual]`

API to send the acknowledgement, after processing a TCU-activity state notification. This indicates that the client is prepared for state transition. Only one acknowledgement is expected from a single client process (may have multiple listeners).

#### Parameters

in	<i>ack</i>	Acknowledgement for a TCU-activity state notification.
----	------------	--

#### Returns

Status of sendActivityStateAck i.e. success or suitable status code.

## 5.33.2 Enumeration Type Documentation

### 5.33.2.1 enum telux::power::TcuActivityState [strong]

Defines the supported TCU-activity states that the listeners will be notified about.

#### Enumerator

**UNKNOWN** To indicate that system state information is not available  
**SUSPEND** System is going to SUSPEND state  
**RESUME** System is going to RESUME state  
**SHUTDOWN** System is going to SHUTDOWN

### 5.33.2.2 enum telux::power::TcuActivityStateAck [strong]

Defines the acknowledgements to TCU-activity states. The client process sends this after processing the TcuActivityState notification, indicating that it is prepared for state transition

Acknowledgement for [TcuActivityState::RESUME](#) is not required, as the state transition has already happened.

#### Enumerator

**SUSPEND\_ACK** processed [TcuActivityState::SUSPEND](#) notification  
**SHUTDOWN\_ACK** processed [TcuActivityState::SHUTDOWN](#) notification

### 5.33.2.3 enum telux::power::ClientType [strong]

Defines the type of the client that would be using the [ITcuActivityManager](#) APIs. Client that just needs the TcuActivityState notifications needs to choose [ClientType::SLAVE](#). And the client that determines the TcuActivityState would choose [ClientType::MASTER](#). Only a Master client can set the TcuActivityState. In a system, there should be a single Master client.

The ClientType needs to be chosen while instantiating the [ITcuActivityManager](#), using the API [PowerFactory::getTcuActivityManager](#)

#### Enumerator

**SLAVE** Client is a slave and interested in state change notification  
**MASTER** Client makes the decision on when the TcuActivityState should change

## 5.34 config

- [Modem Config](#)

This section contains APIs related to Modem config.

## 5.35 Modem Config

This section contains APIs related to Modem Config operations.

### 5.35.1 Data Structure Documentation

#### 5.35.1.1 class telux::config::ConfigFactory

[ConfigFactory](#) allows creation of config related classes.

##### Public member functions

- `std::shared_ptr< IModemConfigManager > getModemConfigManager ()`

##### Static Public Member Functions

- static `ConfigFactory & getInstance ()`

#### 5.35.1.1.1 Member Function Documentation

##### 5.35.1.1.1.1 static ConfigFactory& telux::config::ConfigFactory::getInstance ( ) [static]

Get instance of Config Factory

##### 5.35.1.1.1.2 std::shared\_ptr<IModemConfigManager> telux::config::ConfigFactory::getModemConfigManager ( )

Get instance of ModemConfig manager

##### Returns

pointer of [IModemConfigManager](#) object.

#### 5.35.1.2 struct telux::config::ConfigInfo

##### Data fields

Type	Field	Description
<a href="#">ConfigId</a>	id	id - stores the id of the configuration type - stores config type size - stores the size of the configuration desc - stores the configuration description version - stores version of the config file
<a href="#">ConfigType</a>	type	
uint32_t	size	
string	desc	
uint32_t	version	

### 5.35.1.3 class telux::config::IModemConfigListener

Listener class for getting notifications related to configuration change detection. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe.

#### Public member functions

- virtual void `onConfigUpdateStatus` (`ConfigUpdateStatus` status, int slotId)
- virtual `~IModemConfigListener` ()

#### 5.35.1.3.1 Constructors and Destructors

5.35.1.3.1.1 virtual `telux::config::IModemConfigListener::~~IModemConfigListener` ( ) [`virtual`]

Destructor of `IModemConfigListener`

#### 5.35.1.3.2 Member Function Documentation

5.35.1.3.2.1 virtual void `telux::config::IModemConfigListener::onConfigUpdateStatus` ( `ConfigUpdateStatus` status, int slotId ) [`virtual`]

This function is called when a configuration update is detected. It is applicable only to SOFTWARE config.

#### Parameters

in	<i>status</i>	update status of config.
in	<i>slotId</i>	slotId where update is detected.

### 5.35.1.4 class telux::config::IModemConfigManager

`IModemConfigManager` provides interface to list config files present in modem's storage. load a new config file in modem, activate a config file, get active config file information, deactivate a config file, delete config file from the modem's storage, get and set mode of config auto selection, register and deregister listener for config update in modem. The config files are also referred to as MBNs.

#### Public member functions

- virtual bool `isSubsystemReady` ()=0
- virtual `std::future< bool >` `onSubsystemReady` ()=0
- virtual `telux::common::Status` `requestConfigList` (`ConfigListCallback` cb)=0
- virtual `telux::common::Status` `loadConfigFile` (`std::string` filePath, `ConfigType` configType, `telux::common::ResponseCallback` cb=nullptr)=0
- virtual `telux::common::Status` `activateConfig` (`ConfigType` configType, `ConfigId` configId, int slotId=DEFAULT\_SLOT\_ID, `telux::common::ResponseCallback` cb=nullptr)=0

- virtual `telux::common::Status getActiveConfig (ConfigType configType, GetActiveConfigCallback cb, int slotId=DEFAULT_SLOT_ID)=0`
- virtual `telux::common::Status deactivateConfig (ConfigType configType, int slotId=DEFAULT_SLOT_ID, telux::common::ResponseCallback cb=nullptr)=0`
- virtual `telux::common::Status deleteConfig (ConfigType configType, ConfigId configId="", telux::common::ResponseCallback cb=nullptr)=0`
- virtual `telux::common::Status getAutoSelectionMode (GetAutoSelectionModeCallback cb, int slotId=DEFAULT_SLOT_ID)=0`
- virtual `telux::common::Status setAutoSelectionMode (AutoSelectionMode mode, int slotId=DEFAULT_SLOT_ID, telux::common::ResponseCallback cb=nullptr)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< IModemConfigListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< IModemConfigListener > listener)=0`
- virtual `~IModemConfigManager ()`

#### 5.35.1.4.1 Constructors and Destructors

**5.35.1.4.1.1** `virtual telux::config::IModemConfigManager::~~IModemConfigManager ( ) [virtual]`

Destructor of `IModemConfigManager`

#### 5.35.1.4.2 Member Function Documentation

**5.35.1.4.2.1** `virtual bool telux::config::IModemConfigManager::isSubsystemReady ( ) [pure virtual]`

Checks the status of modem config subsystem and returns the result.

##### Returns

If true that means `ModemConfigManager` is ready for performing config operations.

**5.35.1.4.2.2** `virtual std::future<bool> telux::config::IModemConfigManager::onSubsystemReady ( ) [pure virtual]`

Wait for modem config subsystem to be ready.

##### Returns

A future that caller can wait on to be notified when modem config subsystem is ready.

**5.35.1.4.2.3** `virtual telux::common::Status telux::config::IModemConfigManager::requestConfigList ( ConfigListCallback cb ) [pure virtual]`

Fetching the list of config files present in modem's storage.

in	<i>cb</i>	- callback to the Response function.
----	-----------	--------------------------------------

returns SUCCESS if the request to get config list is sent successfully.

**5.35.1.4.2.4 virtual telux::common::Status telux::config::IModemConfigManager::loadConfigFile ( std::string *filePath*, ConfigType *configType*, telux::common::ResponseCallback *cb* = nullptr ) [pure virtual]**

Loads a new config file into the modem's storage. This is a persistent operation. Only the config files loaded into the modem's storage can be activated.

#### Parameters

in	<i>filePath</i>	- it defines the path to the config file.
in	<i>configType</i>	- type of the config file.
in	<i>cb</i>	- callback to the response function.

returns SUCCESS if the request to load config file is sent successfully.

**5.35.1.4.2.5 virtual telux::common::Status telux::config::IModemConfigManager::activateConfig ( ConfigType *configType*, ConfigId *configId*, int *slotId* = DEFAULT\_SLOT\_ID, telux::common::ResponseCallback *cb* = nullptr ) [pure virtual]**

Activates the config file on specified slot id. A file for activation must be loaded or should already be present in modem's storage.

#### Parameters

in	<i>configType</i>	- type of the config file.
in	<i>configId</i>	- id of the config file.
in	<i>slotId</i>	- it defines the slot id to be selected.
in	<i>cb</i>	- callback to the response function.

#### Returns

SUCCESS if the request to activate config file is sent successfully.

**5.35.1.4.2.6 virtual telux::common::Status telux::config::IModemConfigManager::getActiveConfig ( ConfigType *configType*, GetActiveConfigCallback *cb*, int *slotId* = DEFAULT\_SLOT\_ID ) [pure virtual]**

Get the currently active config file information for the specified slot id. In case default config files are activated, would return error.

#### Parameters

in	<i>configType</i>	- type of the config file.
in	<i>cb</i>	- callback to the response function.

in	<i>slotId</i>	- it defines the slot id to be selected.
----	---------------	--

### Returns

SUCCESS if the request to get active config information is sent successfully.

**5.35.1.4.2.7** `virtual telux::common::Status telux::config::IModemConfigManager::deactivateConfig ( ConfigType configType, int slotId = DEFAULT_SLOT_ID, telux::common::Response↔ Callback cb = nullptr ) [pure virtual]`

Deactivates the config file for the specified slot id.

### Parameters

in	<i>configType</i>	- type of the config file.
in	<i>slotId</i>	- slot id to be selected for deactivation of config.
in	<i>cb</i>	- callback to the response function.

### Returns

SUCCESS if the request to deactivate config file is sent successfully

**5.35.1.4.2.8** `virtual telux::common::Status telux::config::IModemConfigManager::deleteConfig ( ConfigType configType, ConfigId configId = "", telux::common::ResponseCallback cb = nullptr ) [pure virtual]`

Deletes the config file from the modem's storage.

### Parameters

in	<i>configType</i>	- type of the config file.
in	<i>configId</i>	- id of the config file. This parameter is optional if not provided all the config files of the given config type are deleted from modem's storage.
in	<i>cb</i>	- callback to the Response function.

### Returns

SUCCESS if the request to delete config file is sent successfully

**5.35.1.4.2.9** `virtual telux::common::Status telux::config::IModemConfigManager::getAutoSelection↔ Mode ( GetAutoSelectionModeCallback cb, int slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Fetching the mode of config auto selection for specified slot id.

in	<i>cb</i>	- callback to the response function.
in	<i>slotId</i>	- slot id of config.

**Returns**

SUCCESS if the request to get selection mode is sent successfully

**5.35.1.4.2.10** `virtual telux::common::Status telux::config::IModemConfigManager::setAutoSelectionMode ( AutoSelectionMode mode, int slotId = DEFAULT_SLOT_ID, telux::common::ResponseCallback cb = nullptr ) [pure virtual]`

Setting the mode of config auto selection for specified slot id.

**Parameters**

in	<i>mode</i>	- auto selection mode status.
in	<i>slotId</i>	- slot id of the config.
in	<i>cb</i>	- callback to the response function.

**Returns**

SUCCESS if the request to set selection mode is sent successfully.

**5.35.1.4.2.11** `virtual telux::common::Status telux::config::IModemConfigManager::registerListener ( std::weak_ptr< IModemConfigListener > listener ) [pure virtual]`

Registers the listener for indications.

**Parameters**

in	<i>listener</i>	- pointer to implemented listener.
----	-----------------	------------------------------------

**Returns**

SUCCESS if the request to register listener is sent successfully.

**5.35.1.4.2.12** `virtual telux::common::Status telux::config::IModemConfigManager::deregisterListener ( std::weak_ptr< IModemConfigListener > listener ) [pure virtual]`

Deregisters the listener from indications.

**Parameters**

in	<i>listener</i>	- pointer to registered listener.
----	-----------------	-----------------------------------

**Returns**

SUCCESS if the request to deregister listener is sent successfully.

## 5.35.2 Enumeration Type Documentation

### 5.35.2.1 enum telux::config::ConfigType [strong]

#### Enumerator

**HARDWARE** For hardware or platform related configuration files

**SOFTWARE** For software or carrier related configuration files

### 5.35.2.2 enum telux::config::AutoSelectionMode [strong]

Selection Mode defines status of auto selection mode for configs.

#### Enumerator

**DISABLED** Auto selection disabled

**ENABLED** Auto selection enabled

### 5.35.2.3 enum telux::config::ConfigUpdateStatus [strong]

ConfigUpdateStatus represent status of config update, a update of config happens when a software config is activated and all segments using the config are updated with new config.

#### Enumerator

**START** start of updation process

**COMPLETE** end of updation process

## 5.36 sensor

- [Sensor service](#)
- [Sensor control](#)
- [Sensor feature control](#)

This section contains APIs related to sensor configuration, control, data acquisition and sensor feature control.

## 5.37 Sensor service

This section contains APIs, data structures and components to access the sensor sub-system.

### 5.37.1 Data Structure Documentation

#### 5.37.1.1 struct telux::sensor::SensorInfo

Information related to sensor.

##### Data fields

Type	Field	Description
int	id	Unique identifier for the sensor.
<a href="#">SensorType</a>	type	The type of sensor, <a href="#">telux::sensor::SensorType</a>
string	name	The name of the sensor This name is used to get a reference to a sensor with <a href="#">telux::sensor::ISensorManager::getSensor</a>
string	vendor	The name of the vendor
vector< float >	samplingRates	List of supported sampling rates by the sensor hardware, number of samples per second (Hz)
float	maxSampling↔ Rate	The maximum sampling rate the sensor can be configured for. This can be set in /etc/sensors.conf for each sensor and should be less than the maximum sampling rate supported by the sensor hardware, number of samples per second (Hz)  This attribute should be considered while using the API <a href="#">telux::sensor::ISensor::configure</a>
uint32_t	maxBatch↔ Count↔ Supported	Maximum batch count supported by the sensor, i.e. the maximum number of sensor events that the underlying framework can buffer.  This attribute should be considered while using the API <a href="#">telux::sensor::ISensor::configure</a>
uint32_t	minBatch↔ Count↔ Supported	Minimum batch count supported by the sensor. This is set in /etc/sensors.conf for each sensor.  This attribute should be considered while using the API <a href="#">telux::sensor::ISensor::configure</a>
int	range	The range offered by the sensor. This configuration can be set in /etc/sensors.conf for each sensor.  For accelerometers, this is the number of Gs (force per unit mass due to gravity) in either direction (+/-) on each axis  For gyroscopes, this is the number of degrees per second (dps) in either direction (+/-) along each axis
int	version	The version of the sensor considering the hardware part and the driver
float	resolution	This is the smallest difference between two values reported by this sensor, in meter per second per second for accelerometer, radians per second for gyroscope

Type	Field	Description
float	maxRange	The maximum range this sensor offers, in meter per second per second for accelerometer, radians per second for gyroscope. This attribute depends on the <a href="#">SensorInfo::range</a> of the sensor set in the configuration file. For example, a range of 1G results in a maximum range of approximately 9.8 m/s/s and a range of 2G gives a maximum range of about 19.6 m/s/s.

### 5.37.1.2 struct telux::sensor::SensorConfiguration

Configurable parameters of a sensor.

#### Data fields

Type	Field	Description
float	samplingRate	<p>The sampling rate for the sensor, number of samples per second (Hz)</p> <p>In case of <a href="#">telux::sensor::ISensor::configure</a>, the requested sampling rate should be one of the sampling rates provided in the <a href="#">telux::sensor::SensorInfo::samplingRates</a> and should be less than the <a href="#">telux::sensor::SensorInfo::maxSamplingRate</a>.</p> <p>If the requested sampling rate is less than the minimum value in the <a href="#">telux::sensor::SensorInfo::samplingRates</a>, it will be set to the least of the values in <a href="#">telux::sensor::SensorInfo::samplingRates</a></p> <p>If the requested sampling rate is not one of the supported sampling rates in <a href="#">telux::sensor::SensorInfo::samplingRates</a>, the requested value is floored to the nearest value in <a href="#">telux::sensor::SensorInfo::samplingRates</a></p> <p>Consider <a href="#">telux::sensor::SensorInfo::samplingRates</a> having values 12, 26, 52. If requested sampling rate in configure API is 7, the sampling rate considered by the sensor framework would be 12. If requested sampling rate in configure API is 51, the sampling rate considered by the sensor framework would be 26.</p> <p>In case of a configuration update received via <a href="#">telux::sensor::ISensorEventListener::onConfigurationUpdate</a>, the current sampling rate configuration is passed to the listener</p>

Type	Field	Description
uint32_t	batchCount	<p>The batch count of the sensor.</p> <p>Batch count is the count of number of samples the underlying framework would buffer before notifying the client of the data. The intention is to reduce the number of interactions between the hardware, framework and the user application to reduce power consumption, improve compute efficiency and reduce number of interactions between different components. It is important to consider latency while deciding the batch count for a sensor. Higher the batch count, more is the latency for the samples.</p> <p>In case of <a href="#">telux::sensor::ISensor::configure</a>, the requested batch count should be lesser than the maximum supported batch count <a href="#">telux::sensor::SensorInfo::maxBatchCountSupported</a>. Also, the batch count considered is impacted by the <a href="#">telux::sensor::SensorInfo::minBatchCountSupported</a>.</p> <p>If the requested batch count is less than <a href="#">telux::sensor::SensorInfo::minBatchCountSupported</a>, it will be set to <a href="#">telux::sensor::SensorInfo::minBatchCountSupported</a></p> <p>If the requested batch count is not a multiple of <a href="#">telux::sensor::SensorInfo::minBatchCountSupported</a>, the requested value is floored to the nearest multiple of <a href="#">telux::sensor::SensorInfo::minBatchCountSupported</a></p> <p>Consider <a href="#">telux::sensor::SensorInfo::minBatchCountSupported</a> having a value of 7. If requested batchCount in configure API is 2, the batchCount considered by the sensor framework would be 7. If requested batchCount in configure API is 23, the batchCount considered by the sensor framework would be 21.</p> <p>In case of a configuration update <a href="#">telux::sensor::ISensorEventListener::onConfigurationUpdate</a>, this field indicates the current configuration for batch count.</p>
<a href="#">SensorConfigMask</a>	validityMask	<p>Bitset indicating the validity of the received sensor configuration via <a href="#">telux::sensor::ISensor::getConfiguration</a> and <a href="#">telux::sensor::ISensorEventListener::onConfigurationUpdate</a>. The configuration items that were never set would have return false when tested for using <code>std::bitset::test</code></p> <p>Further, this bitset should be set by the user to indicate the valid fields while configuring the sensor using <a href="#">telux::sensor::ISensor::configure</a>. For continuous stream of data from a sensor, the validity of SAMPLING_RATE and BATCH_COUNT from <a href="#">SensorConfigParams</a> should be considered. If the sensor had been already configured with both sampling rate and batch count, it is possible to reconfigure the sensor partially with just one of these attributes and setting the required validity flag.</p>
<a href="#">SensorConfigMask</a>	updateMask	<p>Bitset indicating the parameters that were updated since last notification via <a href="#">telux::sensor::ISensorEventListener::onConfigurationUpdate</a></p>

### 5.37.1.3 struct telux::sensor::MotionSensorData

Structure of a single sample from a motion sensor.

#### Data fields

Type	Field	Description
float	x	x-axis data, meter per second per second for accelerometer, radians per second for gyroscope
float	y	y-axis data, meter per second per second for accelerometer, radians per second for gyroscope
float	z	z-axis data, meter per second per second for accelerometer, radians per second for gyroscope

### 5.37.1.4 struct telux::sensor::UncalibratedMotionSensorData

Structure of a single sample from uncalibrated motion sensor.

#### Data fields

Type	Field	Description
<a href="#">MotionSensorData</a> ↔	data	Uncalibrated motion sensor data <a href="#">MotionSensorData</a>
<a href="#">MotionSensorData</a> ↔	bias	Bias for the uncalibrated data <a href="#">MotionSensorData</a>

### 5.37.1.5 struct telux::sensor::SensorEvent

Structure of a single sensor event.

#### Data fields

Type	Field	Description
uint64_t	timestamp	Timestamp when the event was generated on the hardware, nanosecond since boot-up
union <a href="#">SensorEvent</a> ↔	__unnamed_↔ _	Sensor data

### 5.37.1.6 struct telux::sensor::SensorFeature

Feature offered by sensor hardware and/or software framework.

#### Data fields

Type	Field	Description
string	name	Name of the feature

### 5.37.1.7 struct telux::sensor::SensorFeatureEvent

Structure of an event that is generated from a sensor feature.

#### Data fields

Type	Field	Description
uint64_t	timestamp	Best estimate of timestamp indicating the time of occurrence of the event, nanosecond since boot-up
string	name	Name of the feature that generated the event
int	id	The ID of the generated event

### 5.37.1.8 class telux::sensor::SensorFactory

[SensorFactory](#) is the central factory to create instances of sensor objects.

#### Public member functions

- virtual std::shared\_ptr< [ISensorManager](#) > [getSensorManager](#) (telux::common::InitResponseCb clientCallback=nullptr)=0
- virtual std::shared\_ptr< [ISensorFeatureManager](#) > [getSensorFeatureManager](#) (telux::common::InitResponseCb clientCallback=nullptr)=0

#### Static Public Member Functions

- static [SensorFactory](#) & [getInstance](#) ()

#### Protected Member Functions

- [SensorFactory](#) ()
- virtual [~SensorFactory](#) ()

#### 5.37.1.8.1 Constructors and Destructors

5.37.1.8.1.1 telux::sensor::SensorFactory::SensorFactory ( ) [protected]

5.37.1.8.1.2 virtual telux::sensor::SensorFactory::~~SensorFactory ( ) [protected], [virtual]

#### 5.37.1.8.2 Member Function Documentation

5.37.1.8.2.1 static [SensorFactory](#)& telux::sensor::SensorFactory::getInstance ( ) [static]

Get Sensor Factory instance.

#### Returns

The singleton instance of [SensorFactory](#) object

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.37.1.8.2.2** `virtual std::shared_ptr<ISensorManager> telux::sensor::SensorFactory::getSensorManager ( telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get an instance of Sensor Manager. The ownership of the returned object is with the caller of this method. The reference to the instance is not held by the [SensorFactory](#). If the returned reference is released, any request for [ISensorManager](#) shall result in creation of a new instance

**Parameters**

in	<i>clientCallback</i>	Optional callback to get the initialization status of SensorManager <a href="#">telux::common::InitResponseCb</a>
----	-----------------------	---

**Returns**

An instance of [ISensorManager](#) If the initialization of the manager and underlying system fails, nullptr is returned

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.37.1.8.2.3** `virtual std::shared_ptr<ISensorFeatureManager> telux::sensor::SensorFactory::getSensorFeatureManager ( telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get an instance of Sensor Feature Manager. The ownership of the returned object is with the caller of this method. The reference to the instance is not held by the [SensorFactory](#). If the returned reference is released, any request for [ISensorFeatureManager](#) shall result in creation of a new instance

**Parameters**

in	<i>clientCallback</i>	Optional callback to get the initialization status of SensorFeatureManager <a href="#">telux::common::InitResponseCb</a>
----	-----------------------	--

**Returns**

An instance of [ISensorFeatureManager](#) If the initialization of the manager and underlying system fails, nullptr is returned

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.37.1.9 union telux::sensor::SensorEvent. \_\_unnamed\_\_

Sensor data

#### Data fields

Type	Field	Description
<a href="#">Motion</a> ↔ <a href="#">SensorData</a>	calibrated	Calibrated data - should be accessed when the <a href="#">SensorType</a> that generated the sensor event accounts for calibration - <a href="#">SensorType::ACCELEROMETER</a> or <a href="#">SensorType::GYROSCOPE</a>
<a href="#">Uncalibrated</a> ↔ <a href="#">Motion</a> ↔ <a href="#">SensorData</a>	uncalibrated	Uncalibrated data - should be accessed when the <a href="#">SensorType</a> that generated the sensor event provides uncalibrated data along with bias information - <a href="#">SensorType::ACCELEROMETER_UNCALIBRATED</a> or <a href="#">SensorType::GYROSCOPE_UNCALIBRATED</a>

## 5.37.2 Enumeration Type Documentation

### 5.37.2.1 enum telux::sensor::SensorType [strong]

Enumeration of different sensors available.

#### Enumerator

**ACCELEROMETER** ID for the accelerometer sensor

**GYROSCOPE** ID for the gyroscope sensor

**GYROSCOPE\_UNCALIBRATED** ID for the uncalibrated gyroscope sensor

**ACCELEROMETER\_UNCALIBRATED** ID for the uncalibrated accelerometer sensor

**INVALID** Denotes that the sensor type is either unknown or invalid

### 5.37.2.2 enum telux::sensor::SensorConfigParams

Enumeration listing the different configuration parameters in

#### Enumerator

**SAMPLING\_RATE** Corresponds to [SensorConfiguration::samplingRate](#)

**BATCH\_COUNT** Corresponds to [SensorConfiguration::batchCount](#)

**SENSOR\_CONFIG\_NUM\_PARAMS**

### 5.37.2.3 enum telux::sensor::SelfTestType [strong]

Types of self test the sensor can perform.

#### Enumerator

**POSITIVE** To initiate self test with positive values

**NEGATIVE** To initiate self test with negative values

## 5.38 Sensor control

This section contains APIs related to sensor configuration, sensor control and data acquisition from sensors.

### 5.38.1 Data Structure Documentation

#### 5.38.1.1 class telux::sensor::ISensorEventListener

[ISensorEventListener](#) interface is used to receive notifications related to sensor events and configuration updates.

The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

#### Public member functions

- virtual void [onEvent](#) (std::shared\_ptr< std::vector< [SensorEvent](#) >> events)
- virtual void [onConfigurationUpdate](#) ([SensorConfiguration](#) configuration)
- virtual [~ISensorEventListener](#) ()

#### 5.38.1.1.1 Constructors and Destructors

##### 5.38.1.1.1.1 virtual telux::sensor::ISensorEventListener::~~ISensorEventListener ( ) [virtual]

The destructor for the sensor event listener

#### 5.38.1.1.2 Member Function Documentation

##### 5.38.1.1.2.1 virtual void telux::sensor::ISensorEventListener::onEvent ( std::shared\_ptr< std::vector< [SensorEvent](#) >> *events* ) [virtual]

This function is called to notify about available sensor events. Note the following constraints on this listener API It shall not perform time consuming (compute or I/O intensive) operations on this thread It shall not invoke an sensor APIs on this thread due to the underlying concurrency model

#### Parameters

in	<i>events</i>	- List of sensor events
----	---------------	-------------------------

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.38.1.1.2.2 virtual void telux::sensor::ISensorEventListener::onConfigurationUpdate ( Sensor↔ Configuration *configuration* ) [virtual]

This function is called to notify any change in sensor configuration.

in	<i>configuration</i>	- The new configuration for the sensor <a href="#">telux::sensor::Sensor↔ Configuration</a> . Fields that have changed can be identified using the <a href="#">telux::sensor::SensorConfiguration::updateMask</a> and fields that are valid can be identified using <a href="#">telux::sensor::SensorConfiguration::validityMask</a>
----	----------------------	--

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.38.1.2 class telux::sensor::ISensor

[ISensor](#) interface is used to access the different services provided by the sensor to configure, activate and get sensor data.

#### Public member functions

- virtual [SensorInfo](#) getSensorInfo ()=0
- virtual [telux::common::Status](#) configure ([SensorConfiguration](#) configuration)=0
- virtual [SensorConfiguration](#) getConfiguration ()=0
- virtual [telux::common::Status](#) activate ()=0
- virtual [telux::common::Status](#) deactivate ()=0
- virtual [telux::common::Status](#) enableLowPowerMode ()=0
- virtual [telux::common::Status](#) disableLowPowerMode ()=0
- virtual [telux::common::Status](#) selfTest ([SelfTestType](#) selfTestType, [SelfTestResultCallback](#) cb)=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [ISensorEventListener](#) > listener)=0
- virtual [telux::common::Status](#) deregisterListener (std::weak\_ptr< [ISensorEventListener](#) > listener)=0
- virtual [~ISensor](#) ()

#### 5.38.1.2.1 Constructors and Destructors

##### 5.38.1.2.1.1 virtual telux::sensor::ISensor::~ISensor ( ) [virtual]

Destructor for [ISensor](#)

### 5.38.1.2.2 Member Function Documentation

#### 5.38.1.2.2.1 virtual SensorInfo telux::sensor::ISensor::getSensorInfo ( ) [pure virtual]

Get the information related to sensor

#### Returns

information related to sensor - [telux::sensor::SensorInfo](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.38.1.2.2.2 virtual telux::common::Status telux::sensor::ISensor::configure ( SensorConfiguration configuration ) [pure virtual]

Configure sensor with desired sampling rate and batch count. Any change in sampling rate or batch count of the sensor will be notified via [telux::sensor::ISensorEventListener::onConfigurationUpdate](#).

In case a sensor needs to be reconfigured after having been activated, the sensor should be deactivated, configured and activated again as a part of the reconfiguration process.

It is always recommended that configuration of a sensor is done before activating it. If a sensor is activated without configuration, the sensor is configured with a default configuration and activated. The default configuration would have the sampling rate set to minimum sampling rate supported [telux::sensor::SensorInfo::samplingRates](#) and the batch count set to maximum batch count supported [telux::sensor::SensorInfo::maxBatchCountSupported](#)

#### Parameters

in	<i>configuration</i>	- The desired configuration for the sensor <a href="#">telux::sensor::SensorConfiguration</a> . Ensure the required validity mask <a href="#">telux::sensor::SensorConfiguration::validityMask</a> is set for the configuration.
----	----------------------	--

#### Returns

status of configuration request - [telux::common::Status](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.38.1.2.2.3 virtual `SensorConfiguration` `telux::sensor::ISensor::getConfiguration ( )` [pure virtual]

Get the current configuration of this sensor

#### Returns

the current configuration of the sensor. `telux::sensor::SensorConfiguration::validityMask` should be checked to know which of the fields in the returned configuration is valid.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.38.1.2.2.4 virtual `telux::common::Status` `telux::sensor::ISensor::activate ( )` [pure virtual]

Activate the sensor. Once activated, any available sensor event will be notified via `telux::sensor::ISensorEventListener::onEvent`

It is always recommended that configuration of a sensor is done before activating it. If a sensor is activated without configuration, the sensor is configured with a default configuration and activated. The default configuration would have the sampling rate set to minimum sampling rate supported `telux::sensor::SensorInfo::samplingRates` and the batch count set to maximum batch count supported `telux::sensor::SensorInfo::maxBatchCountSupported`. Activating an already activated sensor would result in the API returning `telux::common::Status::SUCCESS`.

#### Returns

status of activation request - `telux::common::Status`

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.38.1.2.2.5 virtual `telux::common::Status` `telux::sensor::ISensor::deactivate ( )` [pure virtual]

Deactivate the sensor. Once deactivated, no further sensor events will be notified via `telux::sensor::ISensorEventListener::onEvent`. Deactivating an already inactive sensor would result in the API returning `telux::common::Status::SUCCESS`.

#### Returns

status of deactivation request - `telux::common::Status`

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.38.1.2.2.6 **virtual telux::common::Status telux::sensor::ISensor::enableLowPowerMode ( ) [pure virtual]**

Request the sensor to operate in low power mode. The sensor should be in deactivated state to exercise this API. The success of this request depends on the capabilities of the underlying hardware.

#### Returns

status of request - [telux::common::Status](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.38.1.2.2.7 **virtual telux::common::Status telux::sensor::ISensor::disableLowPowerMode ( ) [pure virtual]**

Request the sensor to exit low power mode. The sensor should be in deactivated state to exercise this API. The success of this request depends on the capabilities of the underlying hardware.

#### Returns

status of request - [telux::common::Status](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.38.1.2.2.8 **virtual telux::common::Status telux::sensor::ISensor::selfTest ( SelfTestType selfTestType, SelfTestResultCallback cb ) [pure virtual]**

Initiate self test on this sensor

If there are active data acquisition sessions corresponding to this sensor, these will be paused and the self test is initiated. Once the self test is complete the sensor data sessions will be restored.

#### Parameters

in	<i>selfTestType</i>	- The type of self test to be performed - <a href="#">telux::sensor::SelfTestType</a>
in	<i>SelfTestResult↔ Callback</i>	- Callback to get the result of the self test initiated

#### Returns

status of the request - [telux::common::Status](#). Note that the result of the self test done by the sensor is provided via the callback - [telux::sensor::SelfTestResultCallback](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.38.1.2.2.9** `virtual telux::common::Status telux::sensor::ISensor::registerListener ( std::weak_ptr< ISensorEventListener > listener ) [pure virtual]`

Register a listener for sensor related events

**Returns**

status of registration request - [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.38.1.2.2.10** `virtual telux::common::Status telux::sensor::ISensor::deregisterListener ( std::weak_ptr< ISensorEventListener > listener ) [pure virtual]`

Deregister a sensor event listener

**Returns**

status of deregistration request - [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.38.1.3 class telux::sensor::ISensorManager**

Sensor Manager class provides APIs to interact with the sensor sub-system and get access to other sensor objects which can be used to configure, activate or get data from the individual sensors available - Gyro, Accelerometer, etc.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) `getServiceStatus ()=0`
- virtual [telux::common::Status](#) `getAvailableSensorInfo (std::vector< SensorInfo > &info)=0`
- virtual [telux::common::Status](#) `getSensor (std::shared_ptr< ISensor > &sensor, std::string name)=0`
- virtual `~ISensorManager ()`

### 5.38.1.3.1 Constructors and Destructors

#### 5.38.1.3.1.1 virtual telux::sensor::~ISensorManager::~~ISensorManager ( ) [virtual]

Destructor for [ISensorManager](#)

### 5.38.1.3.2 Member Function Documentation

#### 5.38.1.3.2.1 virtual telux::common::ServiceStatus telux::sensor::~ISensorManager::getServiceStatus ( ) [pure virtual]

Checks the status of sensor sub-system and returns the result.

#### Returns

the status of sensor sub-system status [telux::common::ServiceStatus](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.38.1.3.2.2 virtual telux::common::Status telux::sensor::~ISensorManager::getAvailableSensorInfo ( std::vector< SensorInfo > & info ) [pure virtual]

Get information related to the sensors available in the system.

#### Parameters

out	<i>info</i>	List of information on sensors available in the system <a href="#">telux::sensor::SensorInfo</a>
-----	-------------	---

#### Returns

status of the request [telux::common::Status](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.38.1.3.2.3 virtual telux::common::Status telux::sensor::~ISensorManager::getSensor ( std::shared\_ptr< ISensor > & sensor, std::string name ) [pure virtual]

Get an instance of [ISensor](#) to interact with the underlying sensor. The provided instance is not a singleton. Everytime this method is called a new sensor object is created. It is the caller's responsibility to maintain the object. Every instance of the sensor returned acts as new client and can configure the underlying sensor with it's own configuration and it's own callbacks for [telux::sensor::ISensorEvent](#) and configuration update among other events [telux::sensor::ISensorEventListener](#).

out	<i>sensor</i>	- An instance of <a href="#">telux::sensor::ISensor</a> to interact with the underlying sensor is provided as a result of the method. If the initialization of the sensor and underlying system fails, sensor is set to nullptr
in	<i>name</i>	- The unique name of the sensor <a href="#">telux::sensor::SensorInfo::name</a> that was provided in the list of sensor information by <a href="#">telux::sensor::getAvailableSensorInfo</a>

**Returns**

Status of request [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.39 Sensor feature control

This section contains APIs related to controlling the features the sensor sub-system offers.

### 5.39.1 Data Structure Documentation

#### 5.39.1.1 class telux::sensor::ISensorFeatureEventListener

[ISensorFeatureEventListener](#) interface is used to receive notifications related to sensor feature events.

The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

#### Public member functions

- virtual void [onEvent](#) ([SensorFeatureEvent](#) event)
- virtual void [onBufferedEvent](#) (std::string sensorName, std::shared\_ptr< std::vector< [SensorEvent](#) >> events, bool isLast)
- virtual [~ISensorFeatureEventListener](#) ()

#### 5.39.1.1.1 Constructors and Destructors

**5.39.1.1.1 virtual telux::sensor::ISensorFeatureEventListener::~ISensorFeatureEventListener ( )**  
[virtual]

The destructor for the sensor feature event listener

#### 5.39.1.1.2 Member Function Documentation

**5.39.1.1.2.1 virtual void telux::sensor::ISensorFeatureEventListener::onEvent ( [SensorFeatureEvent event](#) )** [virtual]

This function is called to notify about sensor feature events

#### Parameters

in	<i>event</i>	- The sensor feature event <a href="#">telux::sensor::SensorFeatureEvent</a> that got triggered
----	--------------	---

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.39.1.1.2.2 virtual void telux::sensor::ISensorFeatureEventListener::onBufferedEvent ( std::string *sensorName*, std::shared\_ptr< std::vector< SensorEvent >> *events*, bool *isLast* ) [virtual]

This function is called to notify about available sensor events that caused one or more sensor feature events [SensorFeatureEvent](#) to occur.

The sensor events that occurred when the apps processor was in sleep mode and triggered the sensor feature to occur will be buffered and delivered using this method instead of [telux::sensor::ISensorEventListener::onEvent](#).

In case a sensor event occurs when the system is active, this listener is not invoked. In this case, the required sensor data that triggered the feature can be obtained from the [telux::sensor::ISensorEventListener::onEvent](#) listener interface.

Note the following constraints on this listener API It shall not perform time consuming (compute or I/O intensive) operations on this thread It shall not invoke an sensor APIs on this thread due to the underlying concurrency model

#### Parameters

in	<i>sensorName</i>	- The name of the sensor that generated the buffered events
in	<i>events</i>	- List of sensor events
in	<i>isLast</i>	- Indicate if this is last notification for the buffered events.

Multiple [@ref telux::sensor::SensorFeature](#) can be  
[@ref telux::sensor::enableFeature](#), whose notifica  
in sequence.  
*isLast* will be set to true to signify last event

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.39.1.2 class telux::sensor::ISensorFeatureManager

Sensor Feature Manager class provides APIs to interact with the sensor framework to list the available features, enable them or disable them. The availability of sensor features depends on the capabilities of the underlying hardware.

#### Public member functions

- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual [telux::common::Status](#) [getAvailableFeatures](#) (std::vector< [SensorFeature](#) > &features)=0
- virtual [telux::common::Status](#) [enableFeature](#) (std::string name)=0
- virtual [telux::common::Status](#) [disableFeature](#) (std::string name)=0
- virtual [telux::common::Status](#) [registerListener](#) (std::weak\_ptr< [ISensorFeatureEventListener](#) > listener)=0

- virtual `telux::common::Status deregisterListener (std::weak_ptr< ISensorFeatureEventListener > listener)=0`
- virtual `~ISensorFeatureManager ()`

### 5.39.1.2.1 Constructors and Destructors

#### 5.39.1.2.1.1 virtual `telux::sensor::ISensorFeatureManager::~ISensorFeatureManager ( ) [virtual]`

Destructor for `ISensorFeatureManager`

### 5.39.1.2.2 Member Function Documentation

#### 5.39.1.2.2.1 virtual `telux::common::ServiceStatus telux::sensor::ISensorFeatureManager::getServiceStatus ( ) [pure virtual]`

Checks the status of sensor sub-system and returns the result.

#### Returns

the status of sensor sub-system status `telux::common::ServiceStatus`

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.39.1.2.2.2 virtual `telux::common::Status telux::sensor::ISensorFeatureManager::getAvailableFeatures ( std::vector< SensorFeature > & features ) [pure virtual]`

Request the sensor framework to provide the available features. The feature could be offered by the sensor framework or the underlying hardware.

#### Parameters

out	<i>features</i>	List of sensor features the sensor framework offers
-----	-----------------	---

#### Returns

status of the request `telux::common::Status`

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.39.1.2.2.3 virtual telux::common::Status telux::sensor::ISensorFeatureManager::enableFeature ( std::string name ) [pure virtual]

Enable the requested feature.

Enabling a sensor feature when the system is active would additionally require enabling the corresponding sensor which is used by the sensor feature. For instance, if the sensor feature uses the accelerometer data, in addition to calling this method, the [telux::sensor::ISensor::activate](#) should also be invoked for the required sensor, in this case, the accelerometer.

If the sensor feature only needs to be enabled during suspend mode, just enabling the sensor feature using this method would be sufficient. The underlying framework would take care to enable the required sensor when the system is about to enter suspend state.

#### Parameters

in	<i>name</i>	The name of the feature to be enabled. Enabling an already enabled feature would result in the API returning <a href="#">telux::common::Status::SUCCESS</a> .
----	-------------	---

#### Returns

status of the request [telux::common::Status](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.39.1.2.2.4 virtual telux::common::Status telux::sensor::ISensorFeatureManager::disableFeature ( std::string name ) [pure virtual]

Disable the requested feature

#### Parameters

in	<i>name</i>	The name of the feature to be disabled. Disabling an already disabled feature would result in the API returning <a href="#">telux::common::Status::SUCCESS</a> .
----	-------------	--

#### Returns

status of the request [telux::common::Status](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.39.1.2.2.5** `virtual telux::common::Status telux::sensor::ISensorFeatureManager::registerListener ( std::weak_ptr< ISensorFeatureEventListener > listener ) [pure virtual]`

Register a listener for sensor feature related events

**Returns**

status of registration request - [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.39.1.2.2.6** `virtual telux::common::Status telux::sensor::ISensorFeatureManager::deregisterListener ( std::weak_ptr< ISensorFeatureEventListener > listener ) [pure virtual]`

Deregister a sensor feature event listener

**Returns**

status of deregistration request - [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.40 platform

- [Filesystem](#)

This section contains APIs related to configure platform functionalities and acquire information from the sub-components.

### 5.40.1 Data Structure Documentation

#### 5.40.1.1 class telux::platform::PlatformFactory

[PlatformFactory](#) allows creation of Platform services related classes.

##### Public member functions

- virtual std::shared\_ptr< [IFsManager](#) > [getFsManager](#) (telux::common::InitResponseCb callback=nullptr)=0

##### Static Public Member Functions

- static [PlatformFactory](#) & [getInstance](#) ()

##### Protected Member Functions

- [PlatformFactory](#) ()
- virtual [~PlatformFactory](#) ()

#### 5.40.1.1.1 Constructors and Destructors

5.40.1.1.1.1 `telux::platform::PlatformFactory::PlatformFactory ( ) [protected]`

5.40.1.1.1.2 `virtual telux::platform::PlatformFactory::~~PlatformFactory ( ) [protected], [virtual]`

#### 5.40.1.1.2 Member Function Documentation

5.40.1.1.2.1 `static PlatformFactory& telux::platform::PlatformFactory::getInstance ( ) [static]`

Get instance of platform Factory

5.40.1.1.2.2 `virtual std::shared_ptr<IFsManager> telux::platform::PlatformFactory::getFsManager ( telux::common::InitResponseCb callback = nullptr ) [pure virtual]`

Get instance of filesystem manager ([IFsManager](#)). The filesystem manager supports notification of filesystem events like EFS restore indications.

##### Parameters

in	<i>callback</i>	Optional callback to get the initialization status of FsManager. <a href="#">telux::common::InitResponseCb</a>
----	-----------------	---

**Returns**

pointer of [IFsManager](#) object.

## 5.41 Filesystem

This section contains APIs, data structures and components to configure and acquire information from the filesystem manager.

### 5.41.1 Data Structure Documentation

#### 5.41.1.1 struct telux::platform::EfsEventInfo

##### Data fields

Type	Field	Description
<a href="#">EfsEvent</a>	event	The event being notified
ErrorCode	error	<a href="#">telux::common::ErrorCode</a> associated with the event

#### 5.41.1.2 class telux::platform::IFsListener

Listener class for getting notifications related to EFS backup/restore operations. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe.

##### Public member functions

- virtual void [OnEfsRestoreEvent](#) ([EfsEventInfo](#) event)
- virtual void [OnEfsBackupEvent](#) ([EfsEventInfo](#) event)
- virtual void [OnFsOperationImminentEvent](#) (uint32\_t timeLeftToStart)
- virtual [~IFsListener](#) ()

##### 5.41.1.2.1 Constructors and Destructors

5.41.1.2.1.1 virtual [telux::platform::IFsListener::~~IFsListener](#) ( ) [[virtual](#)]

Destructor of [IFsListener](#)

##### 5.41.1.2.2 Member Function Documentation

5.41.1.2.2.1 virtual void [telux::platform::IFsListener::OnEfsRestoreEvent](#) ( [EfsEventInfo](#) event ) [[virtual](#)]

This function is called when a EFS restore operation is detected.

##### Parameters

in	<i>event</i>	Event related data. <a href="#">telux::platform::EfsEventInfo</a> .
----	--------------	---

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.2.2.2 `virtual void telux::platform::IFsListener::OnEfsBackupEvent ( EfsEventInfo event )` [`virtual`]

This function is called when a EFS backup operation is detected.

**Parameters**

in	<i>event</i>	Event related data. <a href="#">telux::platform::EfsEventInfo</a> .
----	--------------	---

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.2.2.3 `virtual void telux::platform::IFsListener::OnFsOperationImminentEvent ( uint32_t timeLeftToStart )` [`virtual`]

When the client is about to make an eCall it is expected to invoke `prepareForEcall`. This starts a timer within the `FsManager` which represents the max duration of the eCall. After which the filesystem operations will resume. This API will be invoked to let the client know that resumption of Fs operations is imminent. If the eCall has not yet ended, the client should call `prepareForEcall` again to reset the timer, which will continue to suspend the FS operations.

**Parameters**

in	<i>timeLeftToStart</i>	The time in seconds after which filesystem operations shall re-enable.
----	------------------------	--

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.41.1.3 `class telux::platform::IFsManager`

[IFsManager](#) provides interface to to control and get notified about file system operations. This includes Embedded file system (EFS) operations.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) `getServiceStatus ()`=0
- virtual [telux::common::Status](#) `registerListener (std::weak_ptr< IFsListener > listener)`=0
- virtual [telux::common::Status](#) `deregisterListener (std::weak_ptr< IFsListener > listener)`=0
- virtual [telux::common::Status](#) `startEfsBackup ()`=0

- virtual `telux::common::Status prepareForEcall ()=0`
- virtual `telux::common::Status eCallCompleted ()=0`
- virtual `telux::common::Status prepareForOta (OtaOperation otaOperation, telux::common::ResponseCallback responseCb)=0`
- virtual `telux::common::Status otaCompleted (OperationStatus operationStatus, telux::common::ResponseCallback responseCb)=0`
- virtual `telux::common::Status startAbSync (telux::common::ResponseCallback responseCb)=0`
- virtual `~IFsManager ()`

### 5.41.1.3.1 Constructors and Destructors

5.41.1.3.1.1 virtual `telux::platform::IFsManager::~~IFsManager ( ) [virtual]`

Destructor of `IFsManager`

### 5.41.1.3.2 Member Function Documentation

5.41.1.3.2.1 virtual `telux::common::ServiceStatus telux::platform::IFsManager::getServiceStatus ( ) [pure virtual]`

This status indicates whether the object is in a usable state.

#### Returns

`telux::common::ServiceStatus` indicating the current status of the file system service.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

5.41.1.3.2.2 virtual `telux::common::Status telux::platform::IFsManager::registerListener ( std::weak_ptr< IFsListener > listener ) [pure virtual]`

Registers the listener for FileSystem Manager indications.

#### Parameters

in	<i>listener</i>	- pointer to implemented listener.
----	-----------------	------------------------------------

#### Returns

status of the registration request.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.3.2.3 **virtual telux::common::Status telux::platform::IFsManager::deregisterListener ( std::weak\_ptr< IFsListener > listener ) [pure virtual]**

Deregisters the previously registered listener.

**Parameters**

in	<i>listener</i>	- pointer to registered listener that needs to be removed.
----	-----------------	--

**Returns**

status of the deregistration request.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.3.2.4 **virtual telux::common::Status telux::platform::IFsManager::startEfsBackup ( ) [pure virtual]**

Request to trigger an EFS backup. If the request is successful, the status of EFS backup is notified via [telux::platform::IFsListener::OnEfsBackupEvent](#).

**Returns**

The status of the request - [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.3.2.5 **virtual telux::common::Status telux::platform::IFsManager::prepareForEcall ( ) [pure virtual]**

The Filesystem Manager performs periodic operations which might be resource intensive. Such operations are not desired during other crucial events like an eCall. To avoid performing such operations during such events, the client is recommended to invoke this API before it initiates an eCall. This allows the filesystem manager to prepare the system to restrict any resource intensive operations like filesystem scrubbing during the eCall.

**Note**

- The client would need to periodically invoke this API to ensure that the timer gets reset so that operations do not get re-enabled.

**Returns**

- [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.3.2.6 **virtual telux::common::Status telux::platform::IFsManager::eCallCompleted ( ) [pure virtual]**

Once ecall complete, the client should invoke this API to re-enable filesystem operations like filesystem scrubbing. If the API invocation results in [telux::common::Status::NOTREADY](#), indicating that the sub-system is not ready, the client should retry.

**Returns**

- [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.41.1.3.2.7 **virtual telux::common::Status telux::platform::IFsManager::prepareForOta ( OtaOperation otaOperation, telux::common::ResponseCallback responseCb ) [pure virtual]**

This API should be invoked to allow the filesystem manager to perform operations like prepare the filesystem for an OTA. In addition to this preparation, any on-going operations like scrubbing is stopped.

**Parameters**

in	<i>otaOperation</i>	- <a href="#">telux::platform::OtaOperation</a> .
out	<i>responseCb</i>	- <a href="#">telux::common::ResponseCallback</a> The callback method to be invoked upon completion of OTA preparation and the response is indicated asynchronously.

**Returns**

- [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.41.1.3.2.8** `virtual telux::common::Status telux::platform::IFsManager::otaCompleted ( Operation↔ Status operationStatus, telux::common::ResponseCallback responseCb ) [pure virtual]`

This API should be invoked upon completion of OTA, this will allow the filesystem manager to perform post OTA verifications and re-enable operations that were disabled for performing the OTA, like scrubbing.

**Parameters**

in	<i>operationStatus</i>	- <a href="#">telux::platform::OperationStatus</a> The status of the OTA operation that the client attempted.
out	<i>responseCb</i>	- <a href="#">telux::common::ResponseCallback</a> The callback method to be invoked upon completion of OTA related filesystem verifications and the response is indicated asynchronously.

**Returns**

- [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.41.1.3.2.9** `virtual telux::common::Status telux::platform::IFsManager::startAbSync ( telux↔ ::common::ResponseCallback responseCb ) [pure virtual]`

This API should be invoked when the client decides to mirror the active partition to the inactive partition.

**Parameters**

out	<i>responseCb</i>	- <a href="#">telux::common::ResponseCallback</a> The callback method to be invoked when the mirroring operation is completed and the response is indicated asynchronously.
-----	-------------------	---

**Returns**

- [telux::common::Status](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 5.41.2 Enumeration Type Documentation

### 5.41.2.1 enum telux::platform::EfsEvent [strong]

#### Enumerator

**START** Indicating the beginning of Backup/Restore operation

**END** Indicating the completion of Backup/Restore operation

### 5.41.2.2 enum telux::platform::OperationStatus [strong]

#### Enumerator

**UNKNOWN**

**SUCCESS**

**FAILURE**

### 5.41.2.3 enum telux::platform::OtaOperation [strong]

#### Enumerator

**INVALID**

**START**

**RESUME**

## 5.42 data

- [net](#)

This section contains APIs related to Cellular Data Services.

### 5.42.1 Define Documentation

#### 5.42.1.1 #define PROFILE\_ID\_MAX 0x7FFFFFFF

Default data profile id.

#### 5.42.1.2 #define MAX\_QOS\_FILTERS 16

Max filters in one flow

#### 5.42.1.3 #define IP\_PROT\_UNKNOWN 0xFF

Default IP Protocol number in IPv4 or IPv6 headers.

### 5.42.2 Data Structure Documentation

#### 5.42.2.1 struct telux::data::DataUsage

Data usage statistics.

##### Data fields

Type	Field	Description
uint64_t	bytesRx	Bytes received by client
uint64_t	bytesTx	Bytes transmitted by client .

#### 5.42.2.2 struct telux::data::DeviceDataUsage

Data usage statistics for device.

##### Data fields

Type	Field	Description
string	macAddress	MAC address of the client.
<a href="#">DataUsage</a>	usage	Data usage statistics

#### 5.42.2.3 class telux::data::IClientManager

Client Manager class provides APIs related to devices and clients connected to MDM via different interconnects. A device is any entity with a unique MAC address that is connected to the MDM and clients are characterized by unique IP address. Clients could also be connected over VLANs. Interconnects can be wired (e.g. Ethernet) or wireless (e.g. WLAN).

**Public member functions**

- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< IClientListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< IClientListener > listener)=0`
- virtual `telux::common::ErrorCode getDeviceDataUsageStats (std::vector< DeviceDataUsage > &usageStats)=0`
- virtual `telux::common::ErrorCode resetDataUsageStats ()=0`

**5.42.2.3.1 Member Function Documentation****5.42.2.3.1.1 virtual `telux::common::ServiceStatus telux::data::IClientManager::getServiceStatus ( )` [pure virtual]**

Checks the status of Client manager object and returns the result.

**Returns**

`SERVICE_AVAILABLE` - If Client manager object is ready for service.

`SERVICE_UNAVAILABLE` - If Client manager object is temporarily unavailable.

`SERVICE_FAILED` - If Client manager object encountered an irrecoverable failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.3.1.2 virtual `telux::common::Status telux::data::IClientManager::registerListener ( std::weak_ptr< IClientListener > listener )` [pure virtual]**

Register listener with client manager for service status events and other notifications

**Parameters**

in	<i>listener</i>	pointer of <code>IClientListener</code> object that processes the notification
----	-----------------	--

**Returns**

Status of registerListener success or suitable status code

**5.42.2.3.1.3 virtual `telux::common::Status telux::data::IClientManager::deregisterListener ( std::weak_ptr< IClientListener > listener )` [pure virtual]**

Removes a previously added listener.

in	<i>listener</i>	pointer of <a href="#">IClientListener</a> object that needs to be removed
----	-----------------	--

**Returns**

Status of deregisterListener success or suitable status code

#### 5.42.2.3.1.4 **virtual telux::common::ErrorCode telux::data::IClientManager::getDeviceDataUsageStats ( std::vector< DeviceDataUsage > & usageStats ) [pure virtual]**

Get data usage for connected devices

This API provides the usage of a backhaul (e.g. cellular WWAN connection) on the MDM by various devices. The usage does not include any traffic sent between devices within the same vehicle. A device is any entity with a unique MAC address that is connected to the MDM either over a wired or wireless interconnect. Device data usage monitoring should be enabled for this api to work. Status of device data usage monitoring can be obtained by using [telux::data::IDataSettingsManager::isDeviceDataUsageMonitoringEnabled](#).

Statistics are reset when a backhaul switch occurs, such as switching from a WWAN interface to a WLAN interface. In this case the last known statistics of the device before the reset will be provided via [IClientListener::onDeviceDataUsageResetImminent](#). The statistics can also be explicitly reset using [IClientManager::resetDataUsageStats](#). In this case, no notification will be sent about the last known statistics before reset.

**Parameters**

out	<i>usageStats</i>	List of data usage information, per device.
-----	-------------------	---

**Returns**

Return code for whether the operation succeeded or failed If usage monitoring is not enabled, INVALID\_STATE is returned.

#### 5.42.2.3.1.5 **virtual telux::common::ErrorCode telux::data::IClientManager::resetDataUsageStats ( ) [pure virtual]**

Reset data usage statistics

The data reported via [IClientManager::getDeviceDataUsageStats](#) will be reset once this API is called.

**Returns**

Return code for whether the operation succeeded or failed. If usage monitoring is not enabled, INVALID\_STATE is returned.

#### 5.42.2.4 class telux::data::IClientListener

Interface for Client listener. Client needs to implement this interface to get access to Client services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

##### Public member functions

- virtual void `onServiceStatusChange` (`telux::common::ServiceStatus` status)
- virtual void `onDeviceDataUsageResetImminent` (const std::vector< `DeviceDataUsage` > usageStats, `UsageResetReason` reason)
- virtual `~IClientListener` ()

##### 5.42.2.4.1 Constructors and Destructors

###### 5.42.2.4.1.1 virtual telux::data::IClientListener::~~IClientListener ( ) [virtual]

Destructor for `IClientListener`

##### 5.42.2.4.2 Member Function Documentation

###### 5.42.2.4.2.1 virtual void telux::data::IClientListener::onServiceStatusChange ( telux::common::↔ ServiceStatus *status* ) [virtual]

This function is called when service status changes.

##### Parameters

in	<i>status</i>	- <code>ServiceStatus</code>
----	---------------	------------------------------

###### 5.42.2.4.2.2 virtual void telux::data::IClientListener::onDeviceDataUsageResetImminent ( const std::vector< `DeviceDataUsage` > *usageStats*, `UsageResetReason` *reason* ) [virtual]

Provides the last known statistics of a connected device, before the statistics become unavailable or are reset.

##### Parameters

in	<i>usageStats</i>	List of disconnected device(with a unique MAC) data usage
in	<i>reason</i>	The event/reason that triggered the data usage reset

#### 5.42.2.5 struct telux::data::IpFamilyInfo

IP Family related Info

**Data fields**

Type	Field	Description
<a href="#">DataCallStatus</a>	status	
<a href="#">IpAddrInfo</a>	addr	

**5.42.2.6 struct telux::data::QosFilterRule**

Encapsulate the Qos Filter rule

**Data fields**

Type	Field	Description
vector< shared_ptr< <a href="#">IpFilter</a> > >	filter	<a href="#">IpFilter</a>
uint16_t	filterId	Unique identifier for each filter.
uint16_t	filterPrecedence	Specifies the order in which filters are applied. A lower numerical value has a higher precedence.

**5.42.2.7 struct telux::data::TrafficFlowTemplate**

QOS TFT Flow info

**Data fields**

Type	Field	Description
<a href="#">QosFlowId</a>	qosId	Mandatory defines current flow id
<a href="#">QosFlow↔ StateChange↔ Event</a>	stateChange	Flow state change event
<a href="#">QosFlowMask</a>	mask	bitmask to denote which of the optional fields in <a href="#">TrafficFlowTemplate</a> are valid
<a href="#">QosIPFlowInfo</a>	txGrantedFlow	Optional
<a href="#">QosIPFlowInfo</a>	rxGrantedFlow	
uint32_t	txFiltersLength	
<a href="#">QosFilterRule</a>	txFilters[ <a href="#">MA↔ X_QOS_FIL↔ TERS</a> ]	
uint32_t	rxFiltersLength	
<a href="#">QosFilterRule</a>	rxFilters[ <a href="#">MA↔ X_QOS_FIL↔ TERS</a> ]	

**5.42.2.8 struct telux::data::TftChangeInfo**

QOS TFT flow change info

**Data fields**

Type	Field	Description
shared_ptr< <a href="#">TrafficFlowTemplate</a> >	tft	TFT flow info <a href="#">TrafficFlowTemplate</a>
<a href="#">QosFlowStateChangeEvent</a>	stateChange	Flow state change event

**5.42.2.9 struct telux::data::BitRateInfo**

Data call bit rate info

**Data fields**

Type	Field	Description
uint64_t	txRate	<b>Deprecated</b> Unused
uint64_t	rxRate	<b>Deprecated</b> Unused
uint64_t	maxTxRate	Maximum transmit rate that can be assigned to device in bits/sec
uint64_t	maxRxRate	Maximum receive rate that can be assigned to device in bits/sec

**5.42.2.10 class telux::data::IDataConnectionManager**

[IDataConnectionManager](#) is a primary interface for cellular connectivity. This interface provides APIs for start and stop data call connections, get data call information and listener for monitoring data calls. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual bool isSubsystemReady ()=0
- virtual std::future< bool > onSubsystemReady ()=0
- virtual [telux::common::Status](#) setDefaultProfile ([OperationType](#) oprType, uint8\_t profileId, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) getDefaultProfile ([OperationType](#) oprType, [DefaultProfileIdResponseCb](#) callback)=0
- virtual [telux::common::Status](#) startDataCall (int profileId, [IpFamilyType](#) ipFamilyType=[IpFamilyType::IPV4V6](#), [DataCallResponseCb](#) callback=nullptr, [OperationType](#) operationType=[OperationType::DATA\\_LOCAL](#), std::string interfaceName="")=0

- virtual `telux::common::Status stopDataCall` (int profileId, IpFamilyType ipFamilyType=IpFamilyType::IPV4V6, DataCallResponseCb callback=nullptr, OperationType operationType=OperationType::DATA\_LOCAL, std::string apn="")=0
- virtual `telux::common::Status registerListener` (std::weak\_ptr< IDataConnectionListener > listener)=0
- virtual `telux::common::Status deregisterListener` (std::weak\_ptr< IDataConnectionListener > listener)=0

### 5.42.2.10.1 Constructors and Destructors

5.42.2.10.1.1 `virtual telux::data::IDataConnectionManager::~IDataConnectionManager ( )`  
[virtual]

Destructor for [IDataConnectionManager](#)

### 5.42.2.10.2 Member Function Documentation

5.42.2.10.2.1 `virtual telux::common::ServiceStatus telux::data::IDataConnectionManager::getService↔`  
`Status ( )` [pure virtual]

Checks the status of data connection manager and returns the result.

#### Returns

SERVICE\_AVAILABLE If data connection manager is ready for service.  
SERVICE\_UNAVAILABLE If data connection manager is temporarily unavailable.  
SERVICE\_FAILED If data connection manager encountered an irrecoverable failure.

5.42.2.10.2.2 `virtual bool telux::data::IDataConnectionManager::isSubsystemReady ( )` [pure  
virtual]

Checks if the data subsystem is ready.

#### Returns

True if Data Connection Manager is ready for service, otherwise returns false.

**Deprecated** Use getServiceStatus API.

**5.42.2.10.2.3** `virtual std::future<bool> telux::data::IDataConnectionManager::onSubsystemReady ( )`  
**[pure virtual]**

Wait for data subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when card manager is ready.

**Deprecated** Use InitResponseCb callback in factory API getDataConnectionManager.

**5.42.2.10.2.4** `virtual telux::common::Status telux::data::IDataConnectionManager::setDefaultProfile (`  
`OperationType oprType, uint8_t profileId, telux::common::ResponseCallback callback =`  
`nullptr ) [pure virtual]`

Set a profile as default which results in the following:

- Default routes in the system will route traffic over the network interface associated with this profile.
- Bridge 0 will be associated with traffic from this profile.

#### Parameters

in	<i>operationType</i>	<a href="#">telux::data::OperationType</a>
in	<i>profileId</i>	Profile identifier to be associated with default handler
in	<i>callback</i>	optional callback to get the response setDefaultProfile

#### Returns

Immediate status of setDefaultProfile i.e. success or suitable status.

**5.42.2.10.2.5** `virtual telux::common::Status telux::data::IDataConnectionManager::getDefaultProfile (`  
`OperationType oprType, DefaultProfileIdResponseCb callback ) [pure virtual]`

Get current default profile to which associated network traffic is routed through bridge 0 and default system routes.

#### Parameters

in	<i>operationType</i>	<a href="#">telux::data::OperationType</a>
in	<i>callback</i>	callback to get the response getDefaultProfile

#### Returns

Immediate status of getDefaultProfile i.e. success or suitable status.

**5.42.2.10.2.6** `virtual telux::common::Status telux::data::IDataConnectionManager::startDataCall ( int profileId, IpFamilyType ipFamilyType = IpFamilyType::IPV4V6, DataCallResponseCb callback = nullptr, OperationType operationType = OperationType::DATA_LOCAL, std::string interfaceName = "" ) [pure virtual]`

Starts a data call corresponding to default or specified profile identifier.

This will bring up data call connection based on specified profile identifier, IP family type, and operation type (local/remote). Clients can also specify network interface name that will be associated with data call to be started. This is an asynchronous API. If [telux::common::Status::SUCCESS](#) is returned, client provided callback will be invoked at later time with error code and DataCall object associated with requested call. Clients might receive additional notification for the final data call status. For details see [telux::data::DataCallResponseCb](#).

#### Note

if application starts data call on IPV4V6 then it's expected to stop the data call on same ip family type (i.e IPV4V6).

#### Parameters

in	<i>profileId</i>	Profile identifier corresponding to which data call bring up will be done. Use <a href="#">IDataProfileManager::requestProfileList</a> to get list of available profiles.
in	<i>ipFamilyType</i>	Identifies IP family type
out	<i>callback</i>	Optional callback to get the response of start data call.
in	<i>operationType</i>	Optional <a href="#">telux::data::OperationType</a>
in	<i>interfaceName</i>	Optional name to be assigned to the network interface representing this data call. This option is not supported on all platforms. See documentation of <a href="#">telux::data::DataCallResponseCb</a> for error returned on such platforms.

#### Returns

Immediate status of [startDataCall\(\)](#) request sent i.e. success or suitable status code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.10.2.7** `virtual telux::common::Status telux::data::IDataConnectionManager::stopDataCall ( int profileId, IpFamilyType ipFamilyType = IpFamilyType::IPV4V6, DataCallResponseCb callback = nullptr, OperationType operationType = OperationType::DATA_LOCAL, std::string apn = "" ) [pure virtual]`

Stops a data call corresponding to default or specified profile identifier.

This will tear down specific data call connection based on profile identifier.

**Note**

If application starts data call on IPV4V6 then it's expected to stop the data call on same ip family type (i.e IPV4V6). Client can only stop data call it started.

**Parameters**

in	<i>profileId</i>	Profile identifier corresponding to which data call tear down will be done. Use data profile manager to get the list of available profiles.
in	<i>ipFamilyType</i>	Identifies IP family type
out	<i>callback</i>	Optional callback to get the response of stop data call
in	<i>operationType</i>	Optional <a href="#">telux::data::OperationType</a>
in	<i>apn</i>	Deprecated and currently unused

**Returns**

Immediate status of [stopDataCall\(\)](#) request sent i.e. success or suitable status code. The client receives asynchronous notifications indicating the data call tear-down.

#### 5.42.2.10.2.8 virtual telux::common::Status telux::data::IDataConnectionManager::registerListener ( std::weak\_ptr< IDataConnectionListener > *listener* ) [pure virtual]

Register a listener for specific events in the Connection Manager like establishment of new data call, data call info change and call failure.

**Parameters**

in	<i>listener</i>	pointer of <a href="#">IDataConnectionListener</a> object that processes the notification
----	-----------------	---

**Returns**

Status of registerListener success or suitable status code

#### 5.42.2.10.2.9 virtual telux::common::Status telux::data::IDataConnectionManager::deregisterListener ( std::weak\_ptr< IDataConnectionListener > *listener* ) [pure virtual]

Removes a previously added listener.

**Parameters**

in	<i>listener</i>	pointer of <a href="#">IDataConnectionListener</a> object that needs to be removed
----	-----------------	--

**Returns**

Status of deregisterListener success or suitable status code

**5.42.2.10.2.10 virtual int telux::data::IDataConnectionManager::getSlotId ( ) [pure virtual]**

Get associated slot id for the Data Connection Manager.

**Returns**

SlotId

**5.42.2.10.2.11 virtual telux::common::Status telux::data::IDataConnectionManager::requestDataCallList ( OperationType type, DataCallListResponseCb callback ) [pure virtual]**

Request list of data calls available in the system

**Parameters**

out	<i>OperationType</i>	<a href="#">telux::data::OperationType</a>
out	<i>callback</i>	Callback with list of supported data calls

**5.42.2.11 class telux::data::IDataCall**

Represents single established data call on the device.

**Public member functions**

### 5.42.2.11.1 Constructors and Destructors

5.42.2.11.1.1 virtual `telux::data::IDataCall::~~IDataCall ( ) [virtual]`

Destructor for [IDataCall](#)

### 5.42.2.11.2 Member Function Documentation

5.42.2.11.2.1 virtual `const std::string& telux::data::IDataCall::getInterfaceName ( ) [pure virtual]`

Get interface name for the data call associated.

#### Returns

Interface Name.

5.42.2.11.2.2 virtual `DataBearerTechnology telux::data::IDataCall::getCurrentBearerTech ( ) [pure virtual]`

Get the bearer technology on which earlier data call was brought up like LTE, WCDMA and etc. This is synchronous API called by client to get bearer technology corresponding to data call.

#### Returns

[DataBearerTechnology](#)

5.42.2.11.2.3 virtual `DataCallEndReason telux::data::IDataCall::getDataCallEndReason ( ) [pure virtual]`

Get failure reason for the data call.

#### Returns

[DataCallFailReason](#).

5.42.2.11.2.4 virtual `DataCallStatus telux::data::IDataCall::getDataCallStatus ( ) [pure virtual]`

Get data call status like connected, disconnected and IP address changes.

#### Returns

[DataCallStatus](#).

**5.42.2.11.2.5 virtual IpFamilyInfo telux::data::IDataCall::getIpv4Info ( ) [pure virtual]**

Get IPv4 Family info like connected, disconnected and IP address changes.

**Returns**

[IpFamilyInfo](#).

**5.42.2.11.2.6 virtual IpFamilyInfo telux::data::IDataCall::getIpv6Info ( ) [pure virtual]**

Get IPv6 Family info like connected, disconnected and IP address changes.

**Returns**

[IpFamilyInfo](#).

**5.42.2.11.2.7 virtual TechPreference telux::data::IDataCall::getTechPreference ( ) [pure virtual]**

Get the technology on which the call was brought up.

**Returns**

[TechPreference](#).

**5.42.2.11.2.8 virtual std::list<IpAddrInfo> telux::data::IDataCall::getIpAddressInfo ( ) [pure virtual]**

Get list of IP address information.

**Returns**

List of IP address details.

**5.42.2.11.2.9 virtual IpFamilyType telux::data::IDataCall::getIpFamilyType ( ) [pure virtual]**

Get IP Family Type i.e. IPv4, IPv6 or Both

**Returns**

[IpFamilyType](#).

**5.42.2.11.2.10 virtual int telux::data::IDataCall::getProfileId ( ) [pure virtual]**

Get Profile Id

**Returns**

Profile Identifier.

**5.42.2.11.2.11 virtual SlotId telux::data::IDataCall::getSlotId ( ) [pure virtual]**

Get Slot Id

**Returns**

Subscription Slot Identifier.

**5.42.2.11.2.12 virtual OperationType telux::data::IDataCall::getOperationType ( ) [pure virtual]**

Get data operation used for the DataCall.

**Returns**

[OperationType](#)

**5.42.2.11.2.13 virtual telux::common::Status telux::data::IDataCall::requestTrafficFlowTemplate ( IpFamilyType ipFamilyType, TrafficFlowTemplateCb callback ) [pure virtual]**

Get the current installed QOS Traffic flow template information.

**Parameters**

in	<i>ipFamilyType</i>	- IP Family type <a href="#">IpFamilyType</a> . TFT's are installed per IP Family.
in	<i>callback</i>	- callback function to get the result of API.

**Returns**

Status of requestTrafficFlowTemplate i.e. success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.11.2.14 virtual telux::common::Status telux::data::IDataCall::requestDataCallStatistics ( StatisticsResponseCb callback = nullptr ) [pure virtual]**

Request the data transfer statistics for data call corresponding to specified profile identifier.

**Parameters**

in	<i>callback</i>	Optional callback to get the response of request Data Call Statistics
----	-----------------	---

**Returns**

Status of getDataCallStatistics i.e. success or suitable status code.

**5.42.2.11.2.15** `virtual telux::common::Status telux::data::IDataCall::resetDataCallStatistics ( telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Reset data transfer statistics for data call corresponding to specified profile identifier.

#### Parameters

in	<i>callback</i>	optional callback to get the response of reset Data call statistics
----	-----------------	---

#### Returns

Status of resetDataCallStatistics i.e. success or suitable status code.

**5.42.2.11.2.16** `virtual telux::common::Status telux::data::IDataCall::requestDataCallBitRate ( requestDataCallBitRateResponseCb callback ) [pure virtual]`

Request data call bit rate in (bits/sec).

#### Parameters

out	<i>callback</i>	callback to be called with bit rate results <a href="#">requestDataCallBitRateResponseCb</a>
-----	-----------------	---

#### Returns

Status of requestDataCallBitRate success or suitable status code

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 5.42.2.12 class telux::data::IDataConnectionListener

Interface for Data connection listener object. Client needs to implement this interface to get access to data services notifications like onNewDataCall, onDataCallStatusChanged and onDataCallFailure.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

The notification delivery mechanism uses the same thread to deliver all the queued notifications to ensure they are delivered in order. Considering this, the thread on which the notifications are delivered should not be blocked for longer operations since this would result in delay in delivery of further notifications that are in the queue waiting to be dispatched.

**Public member functions**

- virtual void [onDataCallInfoChanged](#) (const std::shared\_ptr< [IDataCall](#) > &dataCall)
- virtual void [onHwAccelerationChanged](#) (const [ServiceState](#) state)
- virtual void [onTrafficFlowTemplateChange](#) (const std::shared\_ptr< [IDataCall](#) > &dataCall, const std::vector< std::shared\_ptr< [TftChangeInfo](#) >> &tft)
- virtual void [onWwanConnectivityConfigChange](#) (SlotId slotId, bool isConnectivityAllowed)
- virtual [~IDataConnectionListener](#) ()

**5.42.2.12.1 Constructors and Destructors**

**5.42.2.12.1.1** virtual telux::data::IDataConnectionListener::~~IDataConnectionListener ( ) [virtual]

Destructor for [IDataConnectionListener](#)

**5.42.2.12.2 Member Function Documentation**

**5.42.2.12.2.1** virtual void telux::data::IDataConnectionListener::onDataCallInfoChanged ( const std::shared\_ptr< [IDataCall](#) > & *dataCall* ) [virtual]

This function is called when there is a change in the data call.

**Parameters**

in	<i>dataCall</i>	Pointer to <a href="#">IDataCall</a>
----	-----------------	--------------------------------------

**5.42.2.12.2.2** virtual void telux::data::IDataConnectionListener::onHwAccelerationChanged ( const [ServiceState](#) *state* ) [virtual]

This function is called when a change occur in hardware acceleration service.

**Parameters**

in	<i>state</i>	New state of hardware Acceleration service (Active/Inactive)
----	--------------	--

**5.42.2.12.2.3** virtual void telux::data::IDataConnectionListener::onTrafficFlowTemplateChange ( const std::shared\_ptr< [IDataCall](#) > & *dataCall*, const std::vector< std::shared\_ptr< [TftChangeInfo](#) >> & *tft* ) [virtual]

This function is called when the TFT's parameters are changed for a packet data session.

**Parameters**

in	<i>dataCall</i>	Pointer to <a href="#">IDataCall</a>
in	<i>tft</i>	vector of <a href="#">TftChangeInfo</a> <a href="#">TftChangeInfo</a>

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.42.2.12.2.4 virtual void telux::data::IDataConnectionListener::onWwanConnectivityConfigChange ( SlotId *slotId*, bool *isConnectivityAllowed* ) [virtual]

This function is called when WWAN backhaul connectivity config changes.

**Parameters**

in	<i>slotId</i>	- Slot Id for which connectivity has changed.
in	<i>isConnectivityAllowed</i>	- Connectivity status allowed/disallowed.

#### 5.42.2.13 struct telux::data::DataRestrictMode

Defines the supported powersave filtering mode and autoexit for the packet data session. DataRestrictFilter

**Data fields**

Type	Field	Description
DataRestrict↔ ModeType	filterMode	Disable or enable data filter mode. When disabled all the data packets will be forwarded from modem to the apps. When enabled only the data matching the filters will be forwarded from modem to the apps.
DataRestrict↔ ModeType	filterAutoExit	Disable or enable autoexit feature. When enabled, once an incoming packet matching the filter is received, filter mode will be disabled automatically and any packet will be allowed to be forwarded from modem to apps.

#### 5.42.2.14 struct telux::data::PortInfo

Used to define the Port number and range (number of ports following port value) Ex- for ports ranging from 1000-3000 port = 1000 and range= 2000

for single port 5000 port = 5000 and range= 0

**Data fields**

Type	Field	Description
uint16_t	port	Port.
uint16_t	range	Range.

#### 5.42.2.15 struct telux::data::ProfileParams

Profile Parameters used for profile creation, query and modify

**Data fields**

Type	Field	Description
string	profileName	Profile Name
string	apn	APN name
string	userName	APN user name (if any)
string	password	APN password (if any)
<a href="#">TechPreference</a>	techPref	Technology preference, default is <a href="#">TechPreference::UNKNOWN</a>
<a href="#">AuthProtocol↔ Type</a>	authType	Authentication protocol type, default is <a href="#">AuthProtocolType::AUTH_NONE</a>
<a href="#">IpFamilyType</a>	ipFamilyType	Preferred IP family for the call, default is <a href="#">IpFamilyType::UNKNOWN</a>
<a href="#">ApnTypes</a>	apnTypes	APN Types ref

**5.42.2.16 struct telux::data::DataCallStats**

Data transfer statistics structure.

**Data fields**

Type	Field	Description
uint64_t	packetsTx	Number of packets transmitted
uint64_t	packetsRx	Number of packets received
uint64_t	bytesTx	Number of bytes transmitted
uint64_t	bytesRx	Number of bytes received
uint64_t	packets↔ DroppedTx	Number of transmit packets dropped
uint64_t	packets↔ DroppedRx	Number of receive packets dropped

**5.42.2.17 struct telux::data::IpAddrInfo**

IP address information structure

**Data fields**

Type	Field	Description
string	ifAddress	Interface IP address.
unsigned int	ifMask	Subnet mask.
string	gwAddress	Gateway IP address.
unsigned int	gwMask	Subnet mask.
string	primaryDns↔ Address	Primary DNS address.
string	secondary↔ DnsAddress	Secondary DNS address.

### 5.42.2.18 struct telux::data::DataCallEndReason

Structure represents data call failure reason type and code.

#### Data fields

Type	Field	Description
<a href="#">EndReason</a> ↔ <a href="#">Type</a>	type	Data call terminated due to reason type, default is CE_UNKNOWN
<a href="#">union Data</a> ↔ <a href="#">CallEndReason</a>	<a href="#">__unnamed_</a> ↔ _	

### 5.42.2.19 struct telux::data::VlanConfig

Structure for vlan configuration

#### Data fields

Type	Field	Description
<a href="#">InterfaceType</a>	iface	PHY interfaces (i.e. ETH, ECM and RNDIS)
int16_t	vlanId	Vlan identifier (i.e 1-4094)
bool	isAccelerated	is acceleration allowed
uint8_t	priority	Vlan priority - A 3-bit field which refers to the IEEE 802.1p class of service to traffic priority level. Don't care = 0

### 5.42.2.20 struct telux::data::FlowDataRate

QOS Flow data min max rate bits per seconds

#### Data fields

Type	Field	Description
uint64_t	maxRate	QOS Flow maximum data rate
uint64_t	minRate	QOS Flow minimum data rate

### 5.42.2.21 struct telux::data::QosIPFlowInfo

QOS Flow IP info

#### Data fields

Type	Field	Description
<a href="#">QosIPFlow</a> ↔ <a href="#">Mask</a>	mask	Valid parameters of <a href="#">QosIPFlowInfo</a> ref
<a href="#">IpTraffic</a> ↔ <a href="#">ClassType</a>	tfClass	IP Traffic class type <a href="#">IpFamilyType</a>
<a href="#">FlowDataRate</a>	dataRate	Flow data rate <a href="#">FlowDataRate</a>

### 5.42.2.22 class telux::data::DataFactory

[DataFactory](#) is the central factory to create all data classes.

#### Public member functions

5.42.2.22.1.1 `telux::data::DataFactory::DataFactory ( ) [protected]`

5.42.2.22.1.2 `virtual telux::data::DataFactory::~~DataFactory ( ) [protected], [virtual]`

### 5.42.2.22.2 Member Function Documentation

5.42.2.22.2.1 `static DataFactory& telux::data::DataFactory::getInstance ( ) [static]`

Get Data Factory instance.

5.42.2.22.2.2 `virtual std::shared_ptr<IDataConnectionManager> telux::data::DataFactory::get<←  
DataConnectionManager ( SlotId slotId = DEFAULT_SLOT_ID, telux::common::Init<←  
ResponseCb clientCallback = nullptr ) [pure virtual]`

Get Data Connection Manager

#### Parameters

in	<i>slotId</i>	Unique identifier for the SIM slot
in	<i>clientCallback</i>	Optional callback to get the initialization status of DataConnectionManager telux::data::DataInitSlotIdResponseCb.

#### Returns

instance of [IDataConnectionManager](#)

5.42.2.22.2.3 `virtual std::shared_ptr<IDataProfileManager> telux::data::DataFactory::getData<←  
ProfileManager ( SlotId slotId = DEFAULT_SLOT_ID, telux::common::InitResponseCb  
clientCallback = nullptr ) [pure virtual]`

Get Data Profile Manager

#### Parameters

in	<i>slotId</i>	Unique identifier for the SIM slot
in	<i>clientCallback</i>	Optional callback to get the initialization status of DataProfileManager telux::data::DataInitSlotIdResponseCb.

#### Returns

instance of [IDataProfileManager](#)

**5.42.2.22.2.4** virtual std::shared\_ptr<IServingSystemManager> telux::data::DataFactory::getServingSystemManager ( SlotId slotId = DEFAULT\_SLOT\_ID, telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]

Get Serving System Manager

#### Parameters

in	slotId	Unique identifier for the SIM slot
in	clientCallback	Callback to be called with initialization result

#### Returns

instance of [IServingSystemManager](#)

**5.42.2.22.2.5** virtual std::shared\_ptr<IDataFilterManager> telux::data::DataFactory::getDataFilterManager ( SlotId slotId = DEFAULT\_SLOT\_ID, telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]

Get Data Filter Manager instance

#### Parameters

in	slotId	Unique identifier for the SIM slot
in	clientCallback	Callback to be called with initialization result

#### Returns

instance of [IDataFilterManager](#).

**5.42.2.22.2.6** virtual std::shared\_ptr<telux::data::net::INatManager> telux::data::DataFactory::getNatManager ( telux::data::OperationType oprType, telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]

Get Network Address Translation(NAT) Manager

#### Parameters

in	oprType	Required operation type <a href="#">telux::data::OperationType</a>
in	clientCallback	Optional callback to get the initialization status of NAT manager <a href="#">telux::common::InitResponseCb</a>

#### Returns

instance of [INatManager](#)

**5.42.2.22.2.7** `virtual std::shared_ptr<telux::data::net::IFirewallManager> telux::data::DataFactory<←  
 ::getFirewallManager ( telux::data::OperationType oprType, telux::common::Init<←  
 ResponseCb clientCallback = nullptr ) [pure virtual]`

Get Firewall Manager

#### Parameters

in	<i>oprType</i>	Required operation type <a href="#">telux::data::OperationType</a>
in	<i>clientCallback</i>	Optional callback to get the initialization status of Firewall manager <a href="#">telux::common::InitResponseCb</a>

#### Returns

instance of [IFirewallManager](#)

**5.42.2.22.2.8** `virtual std::shared_ptr<telux::data::net::IFirewallEntry> telux::data::DataFactory::get<←  
 NewFirewallEntry ( IpProtocol proto, Direction direction, IpFamilyType ipFamilyType )  
 [pure virtual]`

Get Firewall entry based on IP protocol and set respective filter (i.e. TCP or UDP)

#### Parameters

in	<i>proto</i>	<a href="#">telux::data::IpProtocol</a>
in	<i>direction</i>	<a href="#">telux::data::Direction</a>
in	<i>ipFamilyType</i>	Identifies IP family type <a href="#">telux::data::IpFamilyType</a>

#### Returns

instance of [IFirewallEntry](#)

**5.42.2.22.2.9** `virtual std::shared_ptr<IIPFilter> telux::data::DataFactory::getNewIpFilter ( IpProtocol  
proto ) [pure virtual]`

Get [IIPFilter](#) instance based on IP Protocol, This can be used in Firewall Manager and Data Filter Manager

#### Parameters

in	<i>proto</i>	<a href="#">telux::data::IpProtocol</a> Some sample protocol values are ICMP = 1 # Internet Control Message Protocol - RFC 792 IGMP = 2 # Internet Group Management Protocol - RFC 1112 TCP = 6 # Transmission Control Protocol - RFC 793 UDP = 17 # User Datagram Protocol - RFC 768 ESP = 50 # Encapsulating Security Payload - RFC 4303
----	--------------	--

#### Returns

instance of [IIPFilter](#) based on [IpProtocol](#) filter (i.e TCP, UDP)

**5.42.2.22.2.10** `virtual std::shared_ptr<telux::data::net::IVlanManager> telux::data::DataFactory::getVlanManager ( telux::data::OperationType oprType, telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get VLAN Manager

#### Parameters

in	<i>oprType</i>	Required operation type <a href="#">telux::data::OperationType</a>
in	<i>clientCallback</i>	Optional callback to get the initialization status of Vlan manager <a href="#">telux::common::InitResponseCb</a>

#### Returns

instance of IVlanManager

**5.42.2.22.2.11** `virtual std::shared_ptr<telux::data::net::ISocksManager> telux::data::DataFactory::getSocksManager ( telux::data::OperationType oprType, telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get Socks Manager

#### Parameters

in	<i>oprType</i>	Required operation type <a href="#">telux::data::OperationType</a>
in	<i>clientCallback</i>	Optional callback to get the initialization status of Socks manager <a href="#">telux::common::InitResponseCb</a>

#### Returns

instance of ISocksManager

**5.42.2.22.2.12** `virtual std::shared_ptr<telux::data::net::IBridgeManager> telux::data::DataFactory::getBridgeManager ( telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get Software Bridge Manager

#### Parameters

in	<i>clientCallback</i>	Optional callback to get the initialization status of Bridge manager <a href="#">telux::common::InitResponseCb</a>
----	-----------------------	--

#### Returns

instance of IBridgeManager

**5.42.2.22.2.13** `virtual std::shared_ptr<telux::data::net::IL2tpManager> telux::data::DataFactory::getL2tpManager ( telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get L2TP Manager

#### Parameters

in	<i>clientCallback</i>	Optional callback to get the initialization status of L2TP manager <a href="#">telux::common::InitResponseCb</a>
----	-----------------------	--

#### Returns

instance of [IL2tpManager](#)

**5.42.2.22.2.14** `virtual std::shared_ptr<telux::data::IDataSettingsManager> telux::data::DataFactory::getDataSettingsManager ( telux::data::OperationType oprType, telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get Data Settings Manager

#### Parameters

in	<i>oprType</i>	Required operation type <a href="#">telux::data::OperationType</a>
in	<i>clientCallback</i>	Optional callback to get the initialization status of Data Settings manager <a href="#">telux::common::InitResponseCb</a>

#### Returns

instance of [IDataSettingsManager](#)

**5.42.2.22.2.15** `virtual std::shared_ptr<IClientManager> telux::data::DataFactory::getClientManager ( telux::common::InitResponseCb clientCallback = nullptr ) [pure virtual]`

Get Client Manager

#### Parameters

in	<i>clientCallback</i>	Optional callback to get the initialization status of ClientManager <a href="#">telux::common::InitResponseCb</a> .
----	-----------------------	---

#### Returns

instance of [IClientManager](#)

### 5.42.2.23 class telux::data::IDataFilterListener

Listener class for listening to filtering mode notifications, like Data filtering mode change. Client need to implement these methods. The methods in listener can be invoked from multiple threads. So the client needs to make sure that the implementation is thread-safe.

#### Public member functions

- virtual void [onDataRestrictModeChange](#) ([DataRestrictMode](#) mode)
- virtual [~IDataFilterListener](#) ()

#### 5.42.2.23.1 Constructors and Destructors

5.42.2.23.1.1 virtual [telux::data::IDataFilterListener::~~IDataFilterListener](#) ( ) [[virtual](#)]

Destructor of [IDataFilterListener](#)

#### 5.42.2.23.2 Member Function Documentation

5.42.2.23.2.1 virtual void [telux::data::IDataFilterListener::onDataRestrictModeChange](#) ( [DataRestrictMode](#) *mode* ) [[virtual](#)]

This function is called when the data filtering mode is changed for the packet data session.

#### Parameters

in	<i>state</i>	the current data filter mode
----	--------------	------------------------------

### 5.42.2.24 class telux::data::IDataFilterManager

[IDataFilterManager](#) class provides interface to enable/disable the data restrict filters and register for data restrict filter. The filtering can be done at any time. One such use case is to do it when we want the AP to suspend so that we are not waking up the AP due to spurious incoming messages. Also to make sure the [DataRestrict](#) mode is enabled.

In contrary to when [DataRestrict](#) mode is disabled, modem will forward all the incoming data packets to AP and might wake up AP unnecessarily.

#### Public member functions

- virtual [~IDataFilterManager](#) ()

### 5.42.2.24.1 Constructors and Destructors

5.42.2.24.1.1 virtual [telux::data::IDataFilterManager::~~IDataFilterManager](#) ( ) [[virtual](#)]

Destructor of [IDataFilterManager](#)

### 5.42.2.24.2 Member Function Documentation

5.42.2.24.2.1 virtual [telux::common::ServiceStatus telux::data::IDataFilterManager::getServiceStatus](#) ( ) [[pure virtual](#)]

Checks the status of data filter manager and returns the result.

#### Returns

the status of sensor sub-system status [telux::common::ServiceStatus](#)

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

5.42.2.24.2.2 virtual bool [telux::data::IDataFilterManager::isReady](#) ( ) [[pure virtual](#)]

Checks the status of Data Filter Service and if the other APIs are ready for use, and returns the result.

#### Returns

True if the services are ready otherwise false.

**Deprecated** Use [getServiceStatus](#) API.

**5.42.2.24.2.3** `virtual std::future<bool> telux::data::IDataFilterManager::onReady ( ) [pure virtual]`

Wait for Data Filter Service to be ready.

#### Returns

A future that caller can wait on to be notified when Data Filter Service are ready.

**Deprecated** Use InitResponseCb callback in factory API getDataFilterManager.

**5.42.2.24.2.4** `virtual telux::common::Status telux::data::IDataFilterManager::registerListener ( std::weak_ptr< IDataFilterListener > listener ) [pure virtual]`

Register a listener for powersave filtering mode notifications.

#### Parameters

in	<i>listener</i>	- Pointer of <a href="#">IDataFilterListener</a> object that processes the notification
----	-----------------	---

#### Returns

Status of registerListener i.e success or suitable status code.

**5.42.2.24.2.5** `virtual telux::common::Status telux::data::IDataFilterManager::deregisterListener ( std::weak_ptr< IDataFilterListener > listener ) [pure virtual]`

Remove a previously registered listener.

#### Parameters

in	<i>listener</i>	- Previously registered <a href="#">IDataFilterListener</a> that needs to be removed
----	-----------------	--

#### Returns

Status of deregisterListener, success or suitable status code

**5.42.2.24.2.6** `virtual telux::common::Status telux::data::IDataFilterManager::setDataRestrictMode ( DataRestrictMode mode, telux::common::ResponseCallback callback = nullptr, int profileId = PROFILE_ID_MAX, IpFamilyType ipFamilyType = IpFamilyType::UNKNOWN ) [pure virtual]`

Changes the Data Powersave filter mode and auto exit feature.

This API enables or disables the powersave filtering mode of the running packet data session. If a data connection is torn down and brought up again, then previous filter mode setting does not persist for that data call session, and requires to be enabled again.

in	<i>mode</i>	- Enable or disable the powersave filtering mode.
in	<i>callback</i>	- Optional callback to get the response for the change in filter mode.
in	<i>profileId</i>	- Optional Profile ID for data connection. If user does not specify the profile id, then the API applies to all the currently running data connection. If user wants to apply the changes to any specific data connection, then its profile id can be specified as input.
in	<i>ipFamilyType</i>	- Optional IP Family type IpFamilyType.If user does not specify the ip family type, then the API applies to all the currently running data connection. If user wants to apply the changes to any specific data connection, then its ip family type can be specified as input.

### Returns

Status of setDataRestrictMode i.e. success or suitable status code.

**5.42.2.24.2.7 virtual telux::common::Status telux::data::IDataFilterManager::requestDataRestrictMode ( std::string ifaceName, DataRestrictModeCb callback ) [pure virtual]**

Get the current Data Powersave filter mode

### Parameters

in	<i>ifaceName</i>	- Interface name for data connection. Note: For global pdn , ifaceName must be empty, as global restrict mode is reported. Per-pdn requests are not supported.
in	<i>callback</i>	- callback function to get the result of API.

### Returns

Status of requestDataRestrictMode i.e. success or suitable status code.

**5.42.2.24.2.8 virtual telux::common::Status telux::data::IDataFilterManager::addDataRestrict↔ Filter ( std::shared\_ptr< llpFilter > & filter, telux::common::ResponseCallback callback = nullptr, int profileId = PROFILE\_ID\_MAX, IpFamilyType ipFamilyType = IpFamilyType::UNKNOWN ) [pure virtual]**

This API adds a filter rules for a packet data session to achieve power savings. In case when DataRestrict mode is enabled and AP is in suspended state, Modem will filter all the incoming data packet and route them to AP only if filter rules added via addDataRestrictFilter API matches the criteria, else they are queued at Modem itself and not forwarded to AP, until filter mode is disabled.

**Parameters**

in	<i>filter</i>	- Filter rule.
in	<i>callback</i>	- Optional callback to get the response.
in	<i>profileId</i>	- Optional Profile ID for data connection. If user does not specify the profile id, then the API applies to all the currently running data connection. If user wants to apply the changes to any specific data connection, then its profile id can be specified as input.
in	<i>ipFamilyType</i>	- Optional IP Family type <a href="#">IpFamilyType</a> . If user does not specify the ip family type, then the API applies to all the currently running data connection. If user wants to apply the changes to any specific data connection, then its ip family type can be specified as input.

**Returns**

Status of addDataRestrictFilter i.e. success or suitable status code.

**5.42.2.24.2.9** `virtual telux::common::Status telux::data::IDataFilterManager::removeAllDataRestrictFilters ( telux::common::ResponseCallback callback = nullptr, int profileId = PROFILE_ID_MAX, IpFamilyType ipFamilyType = IpFamilyType::UNKNOWN ) [pure virtual]`

This API removes all the previous added powersave filter for a packet data session

**Parameters**

in	<i>callback</i>	- Optional callback to get the response.
in	<i>profileId</i>	- Optional Profile ID for data connection. If user does not specify the profile id, then the API applies to all the currently running data connection. If user wants to apply the changes to any specific data connection, then its profile id can be specified as input.
in	<i>ipFamilyType</i>	- Optional IP Family type <a href="#">IpFamilyType</a> . If user does not specify the ip family type, then the API applies to all the currently running data connection. If user wants to apply the changes to any specific data connection, then its ip family type can be specified as input.

**Returns**

Status of removeAllDataRestrictFilters i.e. success or suitable status code.

#### 5.42.2.24.2.10 virtual int telux::data::IDataFilterManager::getSlotId ( ) [pure virtual]

Get associated slot id for the Data Filter Manager.

#### Returns

SlotId

#### 5.42.2.25 class telux::data::DataProfile

[DataProfile](#) class represents single data profile on the modem.

#### Public member functions

- [DataProfile](#) (int id, const std::string &name, const std::string &apn, const std::string &username, const std::string &password, [IpFamilyType](#) ipFamilyType, [TechPreference](#) techPref, [AuthProtocolType](#) authType, [ApnTypes](#) apnTypes)

#### 5.42.2.25.1 Constructors and Destructors

5.42.2.25.1.1 [telux::data::DataProfile::DataProfile](#) ( int *id*, const std::string & *name*, const std::string & *apn*, const std::string & *username*, const std::string & *password*, [IpFamilyType](#) *ipFamilyType*, [TechPreference](#) *techPref*, [AuthProtocolType](#) *authType*, [ApnTypes](#) *apnTypes* )

#### 5.42.2.25.2 Member Function Documentation

**5.42.2.25.2.1 int telux::data::DataProfile::getId ( )**

Get profile identifier.

**Returns**

profile id

**5.42.2.25.2.2 std::string telux::data::DataProfile::getName ( )**

Get profile name.

**Returns**

profile name

**5.42.2.25.2.3 std::string telux::data::DataProfile::getApn ( )**

Get Access Point Name (APN) name.

**Returns**

APN name

**5.42.2.25.2.4 std::string telux::data::DataProfile::getUserName ( )**

Get profile user name.

**Returns**

user name

**5.42.2.25.2.5 std::string telux::data::DataProfile::getPassword ( )**

Get profile password.

**Returns**

profile password

**5.42.2.25.2.6 TechPreference telux::data::DataProfile::getTechPreference ( )**

Get technology preference.

**Returns**

TechPreference [TechPreference](#)

#### 5.42.2.25.2.7 AuthProtocolType telux::data::DataProfile::getAuthProtocolType ( )

Get authentication preference.

##### Returns

AuthProtocolType [AuthProtocolType](#)

#### 5.42.2.25.2.8 IpFamilyType telux::data::DataProfile::getIpFamilyType ( )

Get IP Family type.

##### Returns

IpFamilyType [IpFamilyType](#)

#### 5.42.2.25.2.9 ApnTypes telux::data::DataProfile::getApnTypes ( )

Get Apn type mask.

##### Returns

ApnTypes [ApnTypes](#)

#### 5.42.2.25.2.10 std::string telux::data::DataProfile::toString ( )

Get the text related informative representation of this object.

##### Returns

String containing informative string.

### 5.42.2.25.3 Field Documentation

#### 5.42.2.25.3.1 constexpr int telux::data::DataProfile::PROFILE\_ID\_INVALID = -1 [static]

### 5.42.2.26 class telux::data::IDataProfileListener

Listener class for getting profile change notification.

The methods in the listener can be invoked from multiple threads. It is client's responsibility to make sure the implementation is thread safe.

**Public member functions**

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual void [onProfileUpdate](#) (int profileId, [TechPreference](#) techPreference, [ProfileChangeEvent](#) event)
- virtual [~IDataProfileListener](#) ()

**5.42.2.26.1 Constructors and Destructors**

**5.42.2.26.1.1** virtual [telux::data::IDataProfileListener::~~IDataProfileListener](#) ( ) [[virtual](#)]

Destructor of [IDataProfileListener](#)

**5.42.2.26.2 Member Function Documentation**

**5.42.2.26.2.1** virtual void [telux::data::IDataProfileListener::onServiceStatusChange](#) ( [telux::common::ServiceStatus](#) *status* ) [[virtual](#)]

This function is called when service status changes.

**Parameters**

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

**5.42.2.26.2.2** virtual void [telux::data::IDataProfileListener::onProfileUpdate](#) ( int *profileId*, [TechPreference](#) *techPreference*, [ProfileChangeEvent](#) *event* ) [[virtual](#)]

This function is called when profile change happens.

**Parameters**

in	<i>profileId</i>	- ID of the updated profile.
in	<i>techPreference</i>	- TechPreference.
in	<i>event</i>	- Event that caused the change in profile.

**5.42.2.27 class [telux::data::IDataProfileManager](#)**

[IDataProfileManager](#) is a primary interface for profile management.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::Status](#) [requestProfileList](#) (std::shared\_ptr< [IDataProfileListCallback](#) >

callback=nullptr)=0

- virtual `telux::common::Status createProfile` (const `ProfileParams` &profileParams, std::shared\_ptr< `IDataCreateProfileCallback` > callback=nullptr)=0
- virtual `telux::common::Status deleteProfile` (uint8\_t profileId, `TechPreference` techPreference, std::shared\_ptr< `telux::common::ICommandResponseCallback` > callback=nullptr)=0
- virtual `telux::common::Status modifyProfile` (uint8\_t profileId, const `ProfileParams` &profileParams, std::shared\_ptr< `telux::common::ICommandResponseCallback` > callback=nullptr)=0
- virtual `telux::common::Status queryProfile` (const `ProfileParams` &profileParams, std::shared\_ptr< `IDataProfileListCallback` > callback=nullptr)=0
- virtual `telux::common::Status requestProfile` (uint8\_t profileId, `TechPreference` techPreference, std::shared\_ptr< `IDataProfileCallback` > callback=nullptr)=0
- virtual int `getSlotId` ()=0
- virtual `telux::common::Status registerListener` (std::weak\_ptr< `telux::data::IDataProfileListener` > listener)=0
- virtual `telux::common::Status deregisterListener` (std::weak\_ptr< `telux::data::IDataProfileListener` > listener)=0
- virtual `~IDataProfileManager` ()

#### 5.42.2.27.1 Constructors and Destructors

5.42.2.27.1.1 virtual `telux::data::IDataProfileManager::~IDataProfileManager` ( ) [virtual]

Destructor for `IDataProfileManager`

#### 5.42.2.27.2 Member Function Documentation

5.42.2.27.2.1 virtual `telux::common::ServiceStatus telux::data::IDataProfileManager::getServiceStatus` ( ) [pure virtual]

Checks the status of Data profile manager and returns the result.

##### Returns

`SERVICE_AVAILABLE` If Data profile manager is ready for service. `SERVICE_UNAVAILABLE` If Data profile manager is temporarily unavailable. `SERVICE_FAILED` - If Data profile manager encountered an irrecoverable failure.

5.42.2.27.2.2 virtual `bool telux::data::IDataProfileManager::isSubsystemReady` ( ) [pure virtual]

Checks if the data profile manager is ready.

##### Returns

True if data profile subsystem is ready for service otherwise false.

**Deprecated** Use getServiceStatus API.

**5.42.2.27.2.3** `virtual std::future<bool> telux::data::IDataProfileManager::onSubsystemReady ( )`  
`[pure virtual]`

Waits for data profile subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when data profile subsystem is ready.

**Deprecated** Use InitResponseCb callback in factory API getDataProfileManager.

**5.42.2.27.2.4** `virtual telux::common::Status telux::data::IDataProfileManager::requestProfileList (`  
`std::shared_ptr< IDataProfileListCallback > callback = nullptr ) [pure virtual]`

Request list of profiles supported by the device.

#### Parameters

<i>in, out</i>	<i>callback</i>	Callback pointer to get the response.
----------------	-----------------	---------------------------------------

#### Returns

Status of request profile i.e. success or suitable error code.

**5.42.2.27.2.5** `virtual telux::common::Status telux::data::IDataProfileManager::createProfile ( const`  
`ProfileParams & profileParams, std::shared_ptr< IDataCreateProfileCallback > callback =`  
`nullptr ) [pure virtual]`

Create profile based on data profile params.

#### Parameters

<i>in</i>	<i>profileParams</i>	profileParams configuration to be passed for creating profile either for 3GPP or 3GPP2
<i>in, out</i>	<i>callback</i>	Callback pointer to get the result of create profile

#### Returns

Status of create profile i.e. success or suitable error code.

**5.42.2.27.2.6** `virtual telux::common::Status telux::data::IDataProfileManager::deleteProfile ( uint8_t profileId, TechPreference techPreference, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Delete profile corresponding to profile identifier.

The deletion of a profile does not affect profile index assignments.

#### Parameters

in	<i>profileId</i>	Profile identifier
in	<i>techPreference</i>	Technology Preference like 3GPP / 3GPP2
in	<i>callback</i>	Callback pointer to get the result of delete profile

#### Returns

Status of delete profile i.e. success or suitable error code.

**5.42.2.27.2.7** `virtual telux::common::Status telux::data::IDataProfileManager::modifyProfile ( uint8_t profileId, const ProfileParams & profileParams, std::shared_ptr< telux::common::ICommandResponseCallback > callback = nullptr ) [pure virtual]`

Modify existing profile with new profile params.

#### Parameters

in	<i>profileId</i>	Profile identifier of profile to be modified
in	<i>profileParams</i>	New profileParams configuration passed for updating existing profile
in	<i>callback</i>	Callback pointer to get the result of modify profile

#### Returns

Status of modify profile i.e. success or suitable error code.

**5.42.2.27.2.8** `virtual telux::common::Status telux::data::IDataProfileManager::queryProfile ( const ProfileParams & profileParams, std::shared_ptr< IDataProfileListCallback > callback = nullptr ) [pure virtual]`

Lookup modem profile/s based on given profile params.

#### Parameters

in	<i>profileParams</i>	<a href="#">ProfileParams</a> configuration to be passed
in	<i>callback</i>	Callback pointer to get the result of query profile

#### Returns

Status of query profile i.e. success or suitable error code.

**5.42.2.27.2.9** `virtual telux::common::Status telux::data::IDataProfileManager::requestProfile ( uint8_t profileId, TechPreference techPreference, std::shared_ptr< IDataProfileCallback > callback = nullptr ) [pure virtual]`

Get data profile corresponding to profile identifier.

#### Parameters

in	<i>profileId</i>	Profile identifier
in	<i>techPreference</i>	Technology preference <ul style="list-style-type: none"> <li>• <a href="#">TechPreference</a></li> </ul>
in	<i>callback</i>	Callback pointer to get the result of get profile by ID

#### Returns

Status of requestProfile i.e. success or suitable error code.

**5.42.2.27.2.10** `virtual int telux::data::IDataProfileManager::getSlotId ( ) [pure virtual]`

Get associated slot id for the Data Profile Manager.

#### Returns

SlotId

**5.42.2.27.2.11** `virtual telux::common::Status telux::data::IDataProfileManager::registerListener ( std::weak_ptr< telux::data::IDataProfileListener > listener ) [pure virtual]`

Listen for create, delete and modify profile events.

#### Parameters

in	<i>listener</i>	- Listener that processes the notification.
----	-----------------	---

#### Returns

Status.

**5.42.2.27.2.12** `virtual telux::common::Status telux::data::IDataProfileManager::deregisterListener ( std::weak_ptr< telux::data::IDataProfileListener > listener ) [pure virtual]`

De-register listener.

#### Parameters

in	<i>listener</i>	- Listener to be de-registered.
----	-----------------	---------------------------------

**Returns**

Status.

**5.42.2.28 class telux::data::IDataCreateProfileCallback**

Interface for create profile callback object. Client needs to implement this interface to get single shot responses for command like create profile.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onResponse](#) (int profileId, [telux::common::ErrorCode](#) error)

**5.42.2.28.1 Member Function Documentation****5.42.2.28.1.1 virtual void telux::data::IDataCreateProfileCallback::onResponse ( int *profileId*, [telux::common::ErrorCode](#) *error* ) [virtual]**

This function is called with the response to [IDataProfileManager::createProfile](#) API.

**Parameters**

in	<i>profileId</i>	created profile Id for the response. Use <a href="#">IDataProfileManager::requestProfile</a> to get the data profile
in	<i>error</i>	<a href="#">telux::common::ErrorCode</a>

**5.42.2.29 class telux::data::IDataProfileListCallback**

Interface for getting list of [DataProfile](#) using callback. Client needs to implement this interface to get single shot responses for commands like get profile list and query profile.

The methods in callback can be invoked from different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onProfileListResponse](#) (const std::vector< std::shared\_ptr< [DataProfile](#) >> &profiles, [telux::common::ErrorCode](#) error)

**5.42.2.29.1 Member Function Documentation****5.42.2.29.1.1 virtual void telux::data::IDataProfileListCallback::onProfileListResponse ( const std::vector< std::shared\_ptr< [DataProfile](#) >> & *profiles*, [telux::common::ErrorCode](#) *error* ) [virtual]**

This function is called with the response to requestProfileList API or queryProfile API.

in	<i>profiles</i>	List of profiles supported by the device
in	<i>error</i>	<a href="#">telux::common::ErrorCode</a>

### 5.42.2.30 class [telux::data::IDataProfileCallback](#)

Interface for getting [DataProfile](#) using callback. Client needs to implement this interface to get single shot responses for command like create profile.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onResponse](#) (const std::shared\_ptr< [DataProfile](#) > &profile, [telux::common::ErrorCode](#) error)

#### 5.42.2.30.1 Member Function Documentation

**5.42.2.30.1.1** virtual void [telux::data::IDataProfileCallback::onResponse](#) ( const std::shared\_ptr< [DataProfile](#) > & *profile*, [telux::common::ErrorCode](#) *error* ) [virtual]

This function is called with the response to [IDataProfileManager::requestProfile](#) API.

#### Parameters

in	<i>profile</i>	Response of data profile
in	<i>error</i>	<a href="#">telux::common::ErrorCode</a>

### 5.42.2.31 struct [telux::data::BandInterferenceConfig](#)

N79 5G/Wlan 5GHz interference avoidance configuration

#### Data fields

Type	Field	Description
<a href="#">BandPriority</a>	priority	
uint32_t	wlanWait↔ TimeInSec	Priority settings for N79/Wlan 5G
uint32_t	n79WaitTime↔ InSec	If Wlan 5GHz has higher priority and suffers signal drop, modem will wait for period of time specified here for Wlan signal to recover before enabling N79 5G.

### 5.42.2.32 class [telux::data::IDataSettingsManager](#)

Data Settings Manager class provides APIs related to the data subsystem settings. For example, ability to reset current network settings to factory settings, setting backhaul priority, and enabling roaming per PDN.

**Public member functions**

- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `telux::common::Status setBackhaulPreference (std::vector< BackhaulType > backhaulPref, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status requestBackhaulPreference (RequestBackhaulPrefResponseCb callback)=0`
- virtual `telux::common::Status setBandInterferenceConfig (bool enable, std::shared_ptr< BandInterferenceConfig > config=nullptr, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status requestBandInterferenceConfig (RequestBandInterferenceConfigResponseCb callback)=0`
- virtual `telux::common::Status setWwanConnectivityConfig (SlotId slotId, bool allow, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status requestWwanConnectivityConfig (SlotId slotId, requestWwanConnectivityConfigResponseCb callback)=0`
- virtual `bool isDeviceDataUsageMonitoringEnabled ()=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< IDataSettingsListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< IDataSettingsListener > listener)=0`

**5.42.2.32.1 Member Function Documentation****5.42.2.32.1.1 virtual telux::common::ServiceStatus telux::data::IDataSettingsManager::getServiceStatus ( ) [pure virtual]**

Checks the status of Data Settings manager object and returns the result.

**Returns**

SERVICE\_AVAILABLE - If Data Settings manager object is ready for service.

SERVICE\_UNAVAILABLE - If Data Settings manager object is temporarily unavailable.

SERVICE\_FAILED - If Data Settings manager object encountered an irrecoverable failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.32.1.2 virtual telux::common::Status telux::data::IDataSettingsManager::setBackhaulPreference ( std::vector< BackhaulType > backhaulPref, telux::common::ResponseCallback callback = nullptr ) [pure virtual]**

Set backhaul preference for bridge0 (default bridge) traffic. Bridge0 Traffic routing to backhaul will be attempted on first to least preferred. For instance if backhaul vector contains ETH, USB, and WWAN,

bridge0 traffic routing will be attempted on ETH first, then USB and finally WWAN backhaul. Configuration changes will be persistent across reboots.

### Parameters

in	<i>backhaulPref</i>	vector of <code>telux::data::BackhaulPref</code> which contains the order of backhaul preference to be used when connecting to external network. First element is most preferred and last element is least preferred backhaul.
in	<i>callback</i>	callback to get response for <code>setBackhaulPreference</code> .

### Returns

Status of `setBackhaulPreference` i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.32.1.3** `virtual telux::common::Status telux::data::IDataSettingsManager::requestBackhaulPreference ( RequestBackhaulPrefResponseCb callback ) [pure virtual]`

Request current backhaul preference for bridge0 (default bridge) traffic.

### Parameters

in	<i>callback</i>	callback to get response for <code>requestBackhaulPreference</code> .
----	-----------------	---

### Returns

Status of `requestBackhaulPreference` i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.32.1.4** `virtual telux::common::Status telux::data::IDataSettingsManager::setBandInterferenceConfig ( bool enable, std::shared_ptr< BandInterferenceConfig > config = nullptr, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Configure N79 5G and Wlan 5GHz band priority. Sets priority for modem to use either 5GHz Wlan or N79 5G band when they are both available to avoid interference. In case N79 5G is configured as higher priority: If N79 5G becomes available while 5G Wlan is enabled, Wlan (AP/Sta) will be moved to 2.4 GHz. If N79 5G becomes unavailable for `telux::data::BandInterferenceConfig::n79WaitTimeInSec` time period, Wlan will be moved to 5GHz. In case Wlan 5GHz is configured as higher priority: If Wlan 5GHz (AP/Sta) becomes available while N79 5G is enabled, N79 5G will be disabled. If Wlan 5GHz becomes unavailable

for [telux::data::BandInterferenceConfig::wlanWaitTimeInSec](#) period and N79 5G is available, N79 will be enabled.

### Parameters

in	<i>enable</i>	True: enable interference management. False: disable interference management
in	<i>config</i>	N79 5G /Wlan 5GHz band interference configuration <a href="#">telux::data::BandInterferenceConfig</a>
in	<i>callback</i>	callback to get response for setBandInterferenceConfig.

### Returns

Status of setBandInterferenceConfig i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.32.1.5 virtual [telux::common::Status](#) [telux::data::IDataSettingsManager::requestBandInterferenceConfig](#) ( [RequestBandInterferenceConfigResponseCb](#) *callback* ) [pure virtual]**

Request N79 5G and Wlan 5GHz band priority settings. Request the configurations set by [telux::data::setBandInterferenceConfig](#)

### Parameters

in	<i>callback</i>	callback to get response for requestBandInterferenceConfig.
----	-----------------	---

### Returns

Status of requestBandInterferenceConfig i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.32.1.6 virtual [telux::common::Status](#) [telux::data::IDataSettingsManager::setWwanConnectivityConfig](#) ( [SlotId](#) *slotId*, [bool](#) *allow*, [telux::common::ResponseCallback](#) *callback* = *nullptr* ) [pure virtual]**

Allow/Disallow WWAN connectivity. Controls whether system should allow/disallow WWAN connectivity to cellular network. Default setting is allow WWAN connectivity to cellular network.

- If client selects to disallow WWAN connectivity, any further attempts to start data calls using [telux::data::IDataConnectionManager::startDataCall](#) will fail with

`telux::common::ErrorCode::NOT_SUPPORTED`. Data calls can be connected again only if client selects to allow WWAN connectivity.

- If client selects to disallow WWAN connectivity while data calls are already connected, all WWAN data calls will also be disconnected. Client will also receive `telux::data::IDataConnectionListener::onDataCallInfoChanged` notification with `telux::data::IDataCall` object status `telux::data::DataCallStatus::NET_NO_NET` for all impacted data calls. Configuration changes will be persistent across reboots.

### Parameters

in	<i>slotId</i>	Slot id on which WWAN connectivity to be allowed/disallowed
in	<i>allow</i>	True: allow connectivity, False: disallow connectivity
in	<i>callback</i>	optional callback to get response for <code>setWwanConnectivityConfig</code> .

### Returns

Status of `setWwanConnectivityConfig` i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.32.1.7** `virtual telux::common::Status telux::data::IDataSettingsManager::requestWwanConnectivityConfig ( SlotId slotId, requestWwanConnectivityConfigResponseCb callback ) [pure virtual]`

Request current WWAN connectivity Configuration.

### Parameters

in	<i>slotId</i>	Slot id for which WWAN connectivity to be reported.
in	<i>callback</i>	callback to get response for <code>requestWwanConnectivityConfig</code> .

### Returns

Status of `requestWwanConnectivityConfig` i.e. success or suitable status code.

### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.42.2.32.1.8 virtual bool telux::data::IDataSettingsManager::isDeviceDataUsageMonitoringEnabled ( ) [pure virtual]

Request device data usage monitoring status

This function can be used to obtain the current status of device data usage monitoring.

#### Returns

Returns true if data usage monitoring is enabled, else false.

#### 5.42.2.32.1.9 virtual telux::common::Status telux::data::IDataSettingsManager::registerListener ( std::weak\_ptr< IDataSettingsListener > listener ) [pure virtual]

Register Data Settings Manager as listener for Data Service health events like data service available or data service not available.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IDataSettingsListener</a> object that processes the notification
----	-----------------	---

#### Returns

Status of registerListener success or suitable status code

#### 5.42.2.32.1.10 virtual telux::common::Status telux::data::IDataSettingsManager::deregisterListener ( std::weak\_ptr< IDataSettingsListener > listener ) [pure virtual]

Removes a previously added listener.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IDataSettingsListener</a> object that needs to be removed
----	-----------------	--

#### Returns

Status of deregisterListener success or suitable status code

### 5.42.2.33 class telux::data::IDataSettingsListener

Interface for Data Settings listener object. Client needs to implement this interface to get access to Data Settings services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual void [onWwanConnectivityConfigChange](#) (SlotId slotId, bool isConnectivityAllowed)
- virtual [~IDataSettingsListener](#) ()

**5.42.2.33.1 Constructors and Destructors**

**5.42.2.33.1.1** virtual [telux::data::IDataSettingsListener::~~IDataSettingsListener](#) ( ) [[virtual](#)]

Destructor for [IDataSettingsListener](#)

**5.42.2.33.2 Member Function Documentation**

**5.42.2.33.2.1** virtual void [telux::data::IDataSettingsListener::onServiceStatusChange](#) ( [telux::common::ServiceStatus](#) *status* ) [[virtual](#)]

This function is called when service status changes.

**Parameters**

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

**5.42.2.33.2.2** virtual void [telux::data::IDataSettingsListener::onWwanConnectivityConfigChange](#) ( SlotId *slotId*, bool *isConnectivityAllowed* ) [[virtual](#)]

This function is called when WWAN backhaul connectivity config changes.

**Parameters**

in	<i>slotId</i>	- Slot Id for which connectivity has changed.
in	<i>isConnectivityAllowed</i>	- Connectivity status allowed/disallowed.

**5.42.2.34 struct telux::data::IPv4Info**

IPv4 header info

**Data fields**

Type	Field	Description
string	srcAddr	address of the device that sends the packet.
string	srcSubnetMask	
string	destAddr	address of receiving end
string	destSubnetMask	
<a href="#">TypeOfService</a>	value	level of throughput, reliability, and delay

Type	Field	Description
TypeOfService	mask	
IpProtocol	nextProtoId	Protocol ID (i.e TCP, UDP or ICMP )

### 5.42.2.35 struct telux::data::IPv6Info

IPv6 header info

#### Data fields

Type	Field	Description
string	srcAddr	address of the device that sends the packet.
uint8_t	srcPrefixLen	source prefix length used to create subnet
string	destAddr	address of receiving end
uint8_t	dstPrefixLen	destination prefix length used to create subnet
IpProtocol	nextProtoId	Protocol ID (i.e TCP, UDP or ICMP )
TrafficClass	val	indicates the class or priority of the IPv6 packet, enables the ability to track specific traffic flows at the network layer.
TrafficClass	mask	
FlowLabel	flowLabel	Indicates that this packet belongs to a specific sequence of packets between a source and destination, requiring special handling by intermediate IPv6 routers.
uint8_t	natEnabled	

### 5.42.2.36 struct telux::data::UdpInfo

UDP header info

#### Data fields

Type	Field	Description
PortInfo	src	Source port and range
PortInfo	dest	Destination port and range

### 5.42.2.37 struct telux::data::TcplInfo

TCP header info

#### Data fields

Type	Field	Description
PortInfo	src	Source port and range
PortInfo	dest	Destination port and range

### 5.42.2.38 struct telux::data::IcmpInfo

Internet Control Message Protocol (ICMP)

**Data fields**

Type	Field	Description
uint8_t	type	ICMP message type - RFC2780
uint8_t	code	ICMP message code - RFC2780

**5.42.2.39 struct telux::data::EspInfo**

Encapsulating Security Payload

**Data fields**

Type	Field	Description
uint32_t	spi	Security Parameters Index

**5.42.2.40 class telux::data::IIPFilter**

A IP filter class to add specific filters like what data will be allowed from the modem to the application processor. Only data packets that match the filter will be sent to the apps processor. Also used to configure Firewall rules.

**Public member functions**

- virtual [IPv4Info](#) `getIPv4Info ()=0`
- virtual `telux::common::Status` `setIPv4Info (const IPv4Info &ipv4Info)=0`
- virtual [IPv6Info](#) `getIPv6Info ()=0`
- virtual `telux::common::Status` `setIPv6Info (const IPv6Info &ipv6Info)=0`
- virtual [IpProtocol](#) `getIpProtocol ()=0`
- virtual [IpFamilyType](#) `getIpFamily ()=0`
- virtual `~IIPFilter ()`

**5.42.2.40.1 Constructors and Destructors**

**5.42.2.40.1.1** virtual `telux::data::IIPFilter::~~IIPFilter ( ) [virtual]`

Destructor for [IIPFilter](#)

**5.42.2.40.2 Member Function Documentation**

**5.42.2.40.2.1** virtual [IPv4Info](#) `telux::data::IIPFilter::getIPv4Info ( ) [pure virtual]`

Get the IPv4 header info

**Returns**

[telux::data::IPv4Info](#)

**5.42.2.40.2.2** `virtual telux::common::Status telux::data::IIPFilter::setIPv4Info ( const IPv4Info & ipv4Info ) [pure virtual]`

sets the IPv4 header info

#### Parameters

in	<i>ipv4Info</i>	IPv4 structure <a href="#">telux::data::IPv4Info</a>
----	-----------------	--

#### Returns

Immediate status of [setIPv4Info\(\)](#) request sent i.e. success or suitable status code.

**5.42.2.40.2.3** `virtual IPv6Info telux::data::IIPFilter::getIPv6Info ( ) [pure virtual]`

Get the IPv6 header info

#### Returns

[telux::data::IPv6Info](#)

**5.42.2.40.2.4** `virtual telux::common::Status telux::data::IIPFilter::setIPv6Info ( const IPv6Info & ipv6Info ) [pure virtual]`

sets the IPv6 header info

#### Parameters

in	<i>ipv6Info</i>	IPv6 structure <a href="#">telux::data::IPv6Info</a>
----	-----------------	--

#### Returns

Immediate status of [setIPv6Info\(\)](#) request sent i.e. success or suitable status code.

**5.42.2.40.2.5** `virtual IpProtocol telux::data::IIPFilter::getIpProtocol ( ) [pure virtual]`

Get the IpProtocol Number

#### Returns

[telux::data::IpProtocol](#)

**5.42.2.40.2.6** `virtual IpFamilyType telux::data::IIPFilter::getIpFamily ( ) [pure virtual]`

Get the IP family type

#### Returns

[telux::data::IpFamilyType](#)

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.41 class telux::data::IUDPFilter**

This class represents a IP Filter for the UDP, get the new instance from [telux::data::DataFactory](#).

**Public member functions**

- virtual [UdpInfo](#) `getUdpInfo ()=0`
- virtual [telux::common::Status](#) `setUdpInfo (const UdpInfo &udpInfo)=0`
- virtual `~IUDPFilter ()`

**5.42.2.41.1 Constructors and Destructors****5.42.2.41.1.1 virtual telux::data::IUDPFilter::~IUDPFilter ( ) [virtual]**

Destructor for [IUDPFilter](#)

**5.42.2.41.2 Member Function Documentation****5.42.2.41.2.1 virtual UdpInfo telux::data::IUDPFilter::getUdpInfo ( ) [pure virtual]**

Get the UDP header info

**Returns**

[telux::data::UdpInfo](#)

**5.42.2.41.2.2 virtual telux::common::Status telux::data::IUDPFilter::setUdpInfo ( const UdpInfo &udpInfo ) [pure virtual]**

sets the UDP header info

**Parameters**

in	<i>udpInfo</i>	<a href="#">UdpInfo</a> structure <a href="#">telux::data::UdpInfo</a>
----	----------------	--

**Returns**

Immediate status of [setUdpInfo\(\)](#) request sent i.e. success or suitable status code.

**5.42.2.42 class telux::data::ITcpFilter**

This class represents a IP Filter for the TCP, get the new instance from [telux::data::DataFactory](#).

**Public member functions**

- virtual [TcpInfo](#) `getTcpInfo ()=0`
- virtual `telux::common::Status` `setTcpInfo (const TcpInfo &tcpInfo)=0`
- virtual `~ITcpFilter ()`

**5.42.2.42.1 Constructors and Destructors**

**5.42.2.42.1.1** virtual `telux::data::ITcpFilter::~ITcpFilter ( ) [virtual]`

Destructor for [ITcpFilter](#)

**5.42.2.42.2 Member Function Documentation**

**5.42.2.42.2.1** virtual `TcpInfo` `telux::data::ITcpFilter::getTcpInfo ( ) [pure virtual]`

Get the TCP header info

**Returns**

[telux::data::TcpInfo](#)

**5.42.2.42.2.2** virtual `telux::common::Status` `telux::data::ITcpFilter::setTcpInfo ( const TcpInfo & tcpInfo ) [pure virtual]`

sets the TCP header info

**Parameters**

in	<i>tcpInfo</i>	<a href="#">TcpInfo</a> structure <a href="#">telux::data::TcpInfo</a>
----	----------------	--

**Returns**

Immediate status of `setTcpInfo()` request sent i.e. success or suitable status code.

**5.42.2.43 class telux::data::IcmpFilter**

This class represents a IP Filter for the ICMP, get the new instance from [telux::data::DataFactory](#).

**Public member functions**

- virtual `IcmpInfo` `getIcmpInfo ()=0`
- virtual `telux::common::Status` `setIcmpInfo (const IcmpInfo &icmpInfo)=0`
- virtual `~IcmpFilter ()`

### 5.42.2.43.1 Constructors and Destructors

5.42.2.43.1.1 virtual `telux::data::IcmpFilter::~IcmpFilter ( )` [virtual]

Destructor for [IcmpFilter](#)

### 5.42.2.43.2 Member Function Documentation

5.42.2.43.2.1 virtual `IcmpInfo telux::data::IcmpFilter::getIcmpInfo ( )` [pure virtual]

Get the ICMP header info

#### Returns

[telux::data::IcmpInfo](#)

5.42.2.43.2.2 virtual `telux::common::Status telux::data::IcmpFilter::setIcmpInfo ( const IcmpInfo & icmpInfo )` [pure virtual]

sets the ICMP header info

#### Parameters

in	<i>icmpInfo</i>	<a href="#">TcpInfo</a> structure <a href="#">telux::data::IcmpInfo</a>
----	-----------------	---

#### Returns

Immediate status of [setIcmpInfo\(\)](#) request sent i.e. success or suitable status code.

### 5.42.2.44 class telux::data::IEspFilter

This class represents a IP Filter for the ESP, get the new instance from [telux::data::DataFactory](#).

#### Public member functions

- virtual `EspInfo getEspInfo ()=0`
- virtual `telux::common::Status setEspInfo (const EspInfo &espInfo)=0`
- virtual `~IEspFilter ()`

### 5.42.2.44.1 Constructors and Destructors

5.42.2.44.1.1 virtual `telux::data::IEspFilter::~IEspFilter ( )` [virtual]

Destructor for [IEspFilter](#)

### 5.42.2.44.2 Member Function Documentation

#### 5.42.2.44.2.1 virtual EspInfo telux::data::IEspFilter::getEspInfo ( ) [pure virtual]

Get the ESP header info

#### Returns

[telux::data::EspInfo](#)

#### 5.42.2.44.2.2 virtual telux::common::Status telux::data::IEspFilter::setEspInfo ( const EspInfo & espInfo ) [pure virtual]

sets the ICMP header info

#### Parameters

in	<i>espInfo</i>	<a href="#">EspInfo</a> structure <a href="#">telux::data::EspInfo</a>
----	----------------	--

#### Returns

Immediate status of [setEspInfo\(\)](#) request sent i.e. success or suitable status code.

### 5.42.2.45 struct telux::data::RoamingStatus

Roaming Status.

#### Data fields

Type	Field	Description
bool	isRoaming	True: Roaming on, False: Roaming off
<a href="#">RoamingType</a>	type	International/Domestic. Valid only if roaming is on

### 5.42.2.46 struct telux::data::ServiceStatus

Data Service Status Info.

#### Data fields

Type	Field	Description
<a href="#">DataService↔State</a>	serviceState	
<a href="#">NetworkRat</a>	networkRat	

### 5.42.2.47 class telux::data::IServingSystemManager

Serving System Manager class provides APIs related to the serving system for data functionality. For example, ability to query or be notified about the state of the platform's WWAN PS data serving information.

**Public member functions**

- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `DrbStatus getDrbStatus ()=0`
- virtual `telux::common::Status requestServiceStatus (RequestServiceStatusResponseCb callback)=0`
- virtual `telux::common::Status requestRoamingStatus (RequestRoamingStatusResponseCb callback)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< IServingSystemListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< IServingSystemListener > listener)=0`
- virtual `SlotId getSlotId ()=0`
- virtual `~IServingSystemManager ()`

**5.42.2.47.1 Constructors and Destructors**

**5.42.2.47.1.1** `virtual telux::data::IServingSystemManager::~~IServingSystemManager ( ) [virtual]`

Destructor of `IServingSystemManager`

**5.42.2.47.2 Member Function Documentation**

**5.42.2.47.2.1** `virtual telux::common::ServiceStatus telux::data::IServingSystemManager::getServiceStatus ( ) [pure virtual]`

Checks the status of serving manager object and returns the result.

**Returns**

`SERVICE_AVAILABLE` - If serving manager object is ready for service.

`SERVICE_UNAVAILABLE` - If serving manager object is temporarily unavailable.

`SERVICE_FAILED` - If serving manager object encountered an irrecoverable failure.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.47.2.2 virtual DrbStatus telux::data::IServingSystemManager::getDrbStatus ( ) [pure virtual]**

Get the dedicated radio bearer (DRB) status

**Returns**

current DrbStatus [DrbStatus](#).

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.47.2.3 virtual telux::common::Status telux::data::IServingSystemManager::requestServiceStatus ( RequestServiceStatusResponseCb callback ) [pure virtual]**

Queries the current serving network status

**Parameters**

in	<i>callback</i>	callback to get response for requestServiceStatus
----	-----------------	---

**Returns**

Status of requestServiceStatus i.e. success or suitable status code. if requestServiceStatus returns failure, callback will not be invoked.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.42.2.47.2.4 virtual telux::common::Status telux::data::IServingSystemManager::requestRoaming↔ Status ( RequestRoamingStatusResponseCb callback ) [pure virtual]**

Queries the current roaming status

**Parameters**

in	<i>callback</i>	callback to get response for requestRoamingStatus
----	-----------------	---

**Returns**

Status of requestRoamingStatus i.e. success or suitable status code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.42.2.47.2.5 virtual telux::common::Status telux::data::IServingSystemManager::registerListener ( std::weak\_ptr< IServingSystemListener > *listener* ) [pure virtual]

Register a listener for specific updates from serving system.

**Parameters**

in	<i>listener</i>	Pointer of <a href="#">IServingSystemListener</a> object that processes the notification
----	-----------------	--

**Returns**

Status of registerListener i.e success or suitable status code.

#### 5.42.2.47.2.6 virtual telux::common::Status telux::data::IServingSystemManager::deregisterListener ( std::weak\_ptr< IServingSystemListener > *listener* ) [pure virtual]

Deregister the previously added listener.

**Parameters**

in	<i>listener</i>	Previously registered <a href="#">IServingSystemListener</a> that needs to be removed
----	-----------------	---

**Returns**

Status of removeListener i.e. success or suitable status code

#### 5.42.2.47.2.7 virtual SlotId telux::data::IServingSystemManager::getSlotId ( ) [pure virtual]

Get associated slot id for the Serving System Manager.

**Returns**

SlotId

#### 5.42.2.48 class telux::data::IServingSystemListener

Listener class for data serving system change notification.

The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe.

**Public member functions**

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual void [onDrbStatusChanged](#) ([DrbStatus](#) status)
- virtual void [onServiceStateChanged](#) ([ServiceStatus](#) status)
- virtual void [onRoamingStatusChanged](#) ([RoamingStatus](#) status)
- virtual [~IServingSystemListener](#) ()

**5.42.2.48.1 Constructors and Destructors**

**5.42.2.48.1.1** virtual [telux::data::IServingSystemListener::~~IServingSystemListener](#) ( ) [[virtual](#)]

Destructor of [IServingSystemListener](#)

**5.42.2.48.2 Member Function Documentation**

**5.42.2.48.2.1** virtual void [telux::data::IServingSystemListener::onServiceStatusChange](#) ( [telux↔::common::ServiceStatus](#) *status* ) [[virtual](#)]

This function is called when service status changes.

**Parameters**

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

**5.42.2.48.2.2** virtual void [telux::data::IServingSystemListener::onDrbStatusChanged](#) ( [DrbStatus](#) *status* ) [[virtual](#)]

This function is called whenever Drb status is changed.

**Parameters**

in	<i>status</i>	<a href="#">DrbStatus</a>
----	---------------	---------------------------

**5.42.2.48.2.3** virtual void [telux::data::IServingSystemListener::onServiceStateChanged](#) ( [ServiceStatus](#) *status* ) [[virtual](#)]

This function is called whenever service state is changed.

**Parameters**

in	<i>status</i>	<a href="#">ServiceStatus</a>
----	---------------	-------------------------------

#### 5.42.2.48.2.4 virtual void telux::data::IServingSystemListener::onRoamingStatusChanged ( RoamingStatus *status* ) [virtual]

This function is called whenever roaming status is changed.

##### Parameters

in	<i>status</i>	<a href="#">RoamingStatus</a>
----	---------------	-------------------------------

#### 5.42.2.49 union telux::data::DataCallEndReason. \_\_unnamed\_\_

##### Data fields

Type	Field	Description
<a href="#">MobileIpReasonCode</a>	IpCode	
<a href="#">InternalReasonCode</a>	internalCode	
<a href="#">CallManagerReasonCode</a>	cmCode	
<a href="#">SpecReasonCode</a>	specCode	
<a href="#">PPPReasonCode</a>	pppCode	
<a href="#">EHRPDReasonCode</a>	ehrpdcCode	
<a href="#">Ipv6ReasonCode</a>	ipv6Code	
<a href="#">HandoffReasonCode</a>	handOffCode	

### 5.42.3 Enumeration Type Documentation

#### 5.42.3.1 enum telux::data::UsageResetReason [strong]

The event/reason that can trigger the data usage reset.

##### Enumerator

**SUBSYSTEM\_UNAVAILABLE** Subsystem is unavailable

**BACKHAUL\_SWITCHED** Backhaul is switched

**DEVICE\_DISCONNECTED** Device is disconnected

**WLAN\_DISABLED** WLAN is disabled

**WWAN\_DISCONNECTED** WWAN is disconnected. This will be sent even if only IPv4 or IPv6 goes down on an Ipv4v6 connection

### 5.42.3.2 enum telux::data::IpFamilyType [strong]

Preferred IP family for the connection

#### Enumerator

**UNKNOWN**

**IPV4** IPv4 data connection

**IPV6** IPv6 data connection

**IPV4V6** IPv4 and IPv6 data connection

### 5.42.3.3 enum telux::data::TechPreference [strong]

Technology Preference

#### Enumerator

**UNKNOWN**

**TP\_3GPP** UMTS, LTE

**TP\_3GPP2** CDMA

**TP\_ANY** ANY (3GPP or 3GPP2)

### 5.42.3.4 enum telux::data::AuthProtocolType [strong]

Authentication protocol preference type to be used for PDP context.

#### Enumerator

**AUTH\_NONE**

**AUTH\_PAP** Password Authentication Protocol

**AUTH\_CHAP** Challenge Handshake Authentication Protocol

**AUTH\_PAP\_CHAP**

### 5.42.3.5 enum telux::data::DataRestrictModeType [strong]

Defines the supported filtering mode of the packet data session. DataRestrictFilter

#### Enumerator

**UNKNOWN**

**DISABLE**

**ENABLE**

### 5.42.3.6 enum telux::data::ApnMaskType

Specifies APN types that can be set while creating or modifying a profile

#### Enumerator

**APN\_MASK\_TYPE\_DEFAULT** APN type for default/internet traffic

**APN\_MASK\_TYPE\_IMS** APN type for the IP multimedia subsystem

**APN\_MASK\_TYPE\_MMS** APN type for the multimedia messaging service

**APN\_MASK\_TYPE\_DUN** APN type for the dial up network  
**APN\_MASK\_TYPE\_SUPL** APN type for secure user plane location  
**APN\_MASK\_TYPE\_HIPRI** APN type for high priority mobile data  
**APN\_MASK\_TYPE\_FOTA** APN type for over the air administration  
**APN\_MASK\_TYPE\_CBS** APN type for carrier branded services  
**APN\_MASK\_TYPE\_IA** APN type for initial attach  
**APN\_MASK\_TYPE\_EMERGENCY** APN type for emergency  
**APN\_MASK\_TYPE\_UT** APN type for UT  
**APN\_MASK\_TYPE\_MCX** APN type for mission critical service

#### 5.42.3.7 enum telux::data::DataCallStatus [strong]

Data call event status

##### Enumerator

**INVALID** Invalid  
**NET\_CONNECTED** Call is connected  
**NET\_NO\_NET** Call is disconnected  
**NET\_IDLE** Call is in idle state  
**NET\_CONNECTING** Call is in connecting state  
**NET\_DISCONNECTING** Call is in disconnecting state  
**NET\_RECONFIGURED** Interface is reconfigured, IP Address got changed  
**NET\_NEWADDR** A new IP address was added on an existing call  
**NET\_DELADDR** An IP address was removed from the existing interface

#### 5.42.3.8 enum telux::data::DataBearerTechnology [strong]

Bearer technology types (returned with getCurrentBearerTech).

##### Enumerator

**UNKNOWN** Unknown bearer.  
**CDMA\_1X** 1X technology.  
**EVDO\_REV0** CDMA Rev 0.  
**EVDO\_REVA** CDMA Rev A.  
**EVDO\_REVB** CDMA Rev B.  
**EHRPD** EHRPD.  
**FMC** Fixed mobile convergence.  
**HRPD** HRPD  
**BEARER\_TECH\_3GPP2\_WLAN** IWLAN  
**WCDMA** WCDMA.  
**GPRS** GPRS.  
**HSDPA** HSDPA.  
**HSUPA** HSUPA.  
**EDGE** EDGE.  
**LTE** LTE.  
**HSDPA\_PLUS** HSDPA+.  
**DC\_HSDPA\_PLUS** DC HSDPA+.  
**HSPA** HSPA  
**BEARER\_TECH\_64\_QAM** 64 QAM.

**TDSCDMA** TD-SCDMA.  
**GSM** GSM  
**BEARER\_TECH\_3GPP\_WLAN** IWLAN  
**BEARER\_TECH\_5G** 5G

### 5.42.3.9 enum telux::data::EndReasonType [strong]

Data call end/termination due to reason type.

#### Enumerator

**CE\_UNKNOWN**  
**CE\_MOBILE\_IP**  
**CE\_INTERNAL**  
**CE\_CALL\_MANAGER\_DEFINED**  
**CE\_3GPP\_SPEC\_DEFINED**  
**CE\_PPP**  
**CE\_EHRPD**  
**CE\_IPV6**  
**CE\_HANDOFF**

### 5.42.3.10 enum telux::data::MobileIpReasonCode [strong]

Data call end/termination reason code for [EndReasonType::CE\\_MOBILE\\_IP](#)

#### Enumerator

**CE\_MIP\_FA\_ERR\_REASON\_UNSPECIFIED**  
**CE\_MIP\_FA\_ERR\_ADMINISTRATIVELY\_PROHIBITED**  
**CE\_MIP\_FA\_ERR\_INSUFFICIENT\_RESOURCES**  
**CE\_MIP\_FA\_ERR\_MOBILE\_NODE\_AUTHENTICATION\_FAILURE**  
**CE\_MIP\_FA\_ERR\_HA\_AUTHENTICATION\_FAILURE**  
**CE\_MIP\_FA\_ERR\_REQUESTED\_LIFETIME\_TOO\_LONG**  
**CE\_MIP\_FA\_ERR\_MALFORMED\_REQUEST**  
**CE\_MIP\_FA\_ERR\_MALFORMED\_REPLY**  
**CE\_MIP\_FA\_ERR\_ENCAPSULATION\_UNAVAILABLE**  
**CE\_MIP\_FA\_ERR\_VJHC\_UNAVAILABLE**  
**CE\_MIP\_FA\_ERR\_REVERSE\_TUNNEL\_UNAVAILABLE**  
**CE\_MIP\_FA\_ERR\_REVERSE\_TUNNEL\_IS\_MANDATORY\_AND\_T\_BIT\_NOT\_SET**  
**CE\_MIP\_FA\_ERR\_DELIVERY\_STYLE\_NOT\_SUPPORTED**  
**CE\_MIP\_FA\_ERR\_MISSING\_NAI**  
**CE\_MIP\_FA\_ERR\_MISSING\_HA**  
**CE\_MIP\_FA\_ERR\_MISSING\_HOME\_ADDR**  
**CE\_MIP\_FA\_ERR\_UNKNOWN\_CHALLENGE**  
**CE\_MIP\_FA\_ERR\_MISSING\_CHALLENGE**  
**CE\_MIP\_FA\_ERR\_STALE\_CHALLENGE**  
**CE\_MIP\_HA\_ERR\_REASON\_UNSPECIFIED**  
**CE\_MIP\_HA\_ERR\_ADMINISTRATIVELY\_PROHIBITED**  
**CE\_MIP\_HA\_ERR\_INSUFFICIENT\_RESOURCES**  
**CE\_MIP\_HA\_ERR\_MOBILE\_NODE\_AUTHENTICATION\_FAILURE**

**CE\_MIP\_HA\_ERR\_FA\_AUTHENTICATION\_FAILURE**  
**CE\_MIP\_HA\_ERR\_REGISTRATION\_ID\_MISMATCH**  
**CE\_MIP\_HA\_ERR\_MALFORMED\_REQUEST**  
**CE\_MIP\_HA\_ERR\_UNKNOWN\_HA\_ADDR**  
**CE\_MIP\_HA\_ERR\_REVERSE\_TUNNEL\_UNAVAILABLE**  
**CE\_MIP\_HA\_ERR\_REVERSE\_TUNNEL\_IS\_MANDATORY\_AND\_T\_BIT\_NOT\_SET**  
**CE\_MIP\_HA\_ERR\_ENCAPSULATION\_UNAVAILABLE**  
**CE\_MIP\_ERR\_REASON\_UNKNOWN**

#### 5.42.3.11 enum telux::data::InternalReasonCode [strong]

Data call end/termination reason code for [EndReasonType::CE\\_INTERNAL](#)

##### Enumerator

**CE\_RETRY**  
**CE\_INTERNAL\_ERROR**  
**CE\_CALL\_ENDED**  
**CE\_INTERNAL\_UNKNOWN\_CAUSE\_CODE**  
**CE\_UNKNOWN\_CAUSE\_CODE**  
**CE\_CLOSE\_IN\_PROGRESS**

***DELETE\_PROFILE\_EVENT*** Profile was deleted  
***MODIFY\_PROFILE\_EVENT*** Profile was modified

#### **5.42.3.19 enum telux::data::OperationType [strong]**

This applies in architectures where the modem is attached to an External Application Processor(EAP). An API, like start/stop data call, INatManager, IFirewallManager can be invoked from the EAP or from the modems Internal Application Processor (IAP). This type specifies where the operation should be carried out.

##### **Enumerator**

***DATA\_LOCAL*** Perform the operation on the processor where the API is invoked.  
***DATA\_REMOTE*** Perform the operation on the application processor other than where the API is invoked.

#### **5.42.3.20 enum telux::data::Direction [strong]**

Direction of firewall rule

##### **Enumerator**

***UPLINK*** Uplink Direction  
***DOWNLINK*** Downlink Direction

### 5.42.3.21 enum telux::data::InterfaceType [strong]

Peripheral Interface type

#### Enumerator

**UNKNOWN** UNKNOWN interface  
**WLAN** Wireless Local Area Network (WLAN)  
**ETH** Ethernet (ETH)  
**ECM** Ethernet Control Model (ECM)  
**RNDIS** Remote Network Driver Interface Specification (RNDIS)  
**MHI** Modem Host Interface (MHI)

### 5.42.3.22 enum telux::data::ServiceState [strong]

State of Service

#### Enumerator

**INACTIVE** Service is inactive  
**ACTIVE** Service is Active

### 5.42.3.23 enum telux::data::QosFlowStateChangeEvent [strong]

QOS flow state change type

#### Enumerator

**UNKNOWN** UNKNOWN state  
**ACTIVATED** Flow activated  
**MODIFIED** Flow modified  
**DELETED** Flow deleted

### 5.42.3.24 enum telux::data::IpTrafficClassType [strong]

QOS flow IP traffic class type

#### Enumerator

**UNKNOWN** UNKNOWN type  
**CONVERSATIONAL** Conversational IP Traffic class  
**STREAMING** Streaming IP Traffic class  
**INTERACTIVE** Interactive IP Traffic class  
**BACKGROUND** Background IP Traffic class

### 5.42.3.25 enum telux::data::QosIPFlowMaskType

Specifies QOS IP Flow parameter mask

#### Enumerator

**MASK\_IP\_FLOW\_NONE**

**MASK\_IP\_FLOW\_TRF\_CLASS** No parameters set  
**MASK\_IP\_FLOW\_DATA\_RATE\_MIN\_MAX** Traffic class

#### 5.42.3.26 enum telux::data::QosFlowMaskType

Specifies QOS Flow parameter mask

##### Enumerator

**MASK\_FLOW\_NONE**  
**MASK\_FLOW\_TX\_GRANTED** No parameters set  
**MASK\_FLOW\_RX\_GRANTED** TX Granted flow set  
**MASK\_FLOW\_TX\_FILTERS** RX Granted flow set  
**MASK\_FLOW\_RX\_FILTERS** TX filters set

#### 5.42.3.27 enum telux::data::BackhaulType [strong]

Specifies backhaul types

##### Enumerator

**ETH**  
**USB** Ethernet Backhaul  
**WLAN** USB Backhaul  
**WWAN** WLAN Backhaul  
**BLE** WWAN Backhaul with default profile ID set by  
telux::data::DataConnectionManager::setDefaultProfile  
**MAX\_SUPPORTED** Bluetooth Backhaul

#### 5.42.3.28 enum telux::data::BandPriority [strong]

Set priority between N79 5G and Wlan 5GHz Band

##### Enumerator

**N79**  
**WLAN** N79 has higher priority

#### 5.42.3.29 enum telux::data::DrbStatus [strong]

Dedicated Radio Bearer (DRB) status.

##### Enumerator

**ACTIVE** At least one of the physical links across all PDNs is UP  
**DORMANT** All the Physlinks across all PDNs are DOWN  
**UNKNOWN** No PDN is active

**5.42.3.30 enum telux::data::RoamingType [strong]**

Roaming Type.

**Enumerator**

**UNKNOWN** Device roaming mode is unknown

**DOMESTIC** Device is in Domestic roaming network

**INTERNATIONAL** Device is in International roaming network

**5.42.3.31 enum telux::data::DataServiceState [strong]**

Data Service State. Indicates whether data service is ready to setup a data call or not.

**Enumerator**

**UNKNOWN** Service State not available

**IN\_SERVICE** Service Available

**OUT\_OF\_SERVICE** Service Not Available

**5.42.3.32 enum telux::data::NetworkRat [strong]**

Data Network RATs.

**Enumerator**

**UNKNOWN** UNKNOWN

**CDMA\_1X** CDMA\_1X

**CDMA\_EVDO** CDMA\_EVDO

**GSM** GSM

**WCDMA** WCDMA

**LTE** LTE

**TDSCDMA** TDSCDMA

**NR5G** NR5G

## 5.43 net

This section contains APIs related to data network configuration.

### 5.43.1 Data Structure Documentation

#### 5.43.1.1 struct telux::data::net::BridgeInfo

Structure to configure a software bridge for an interface

##### Data fields

Type	Field	Description
string	ifaceName	Interface name
<a href="#">BridgeInfoType</a>	ifaceType	Interface type
uint32_t	bandwidth	Bandwidth(in Mbps) required for software bridge

#### 5.43.1.2 class telux::data::net::IBridgeManager

[IBridgeManager](#) provides APIs to enable/disable and set/get/delete software bridges for various WLAN and Ethernet interfaces. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

##### Public member functions

- virtual [telux::common::ServiceStatus getServiceStatus](#) ()=0
- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::Status enableBridge](#) (bool enable, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status addBridge](#) ([BridgeInfo](#) config, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status requestBridgeInfo](#) ([BridgeInfoResponseCb](#) callback)=0
- virtual [telux::common::Status removeBridge](#) (std::string ifaceName, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status registerListener](#) (std::weak\_ptr< [IBridgeListener](#) > listener)=0
- virtual [telux::common::Status deregisterListener](#) (std::weak\_ptr< [IBridgeListener](#) > listener)=0
- virtual [~IBridgeManager](#) ()

##### 5.43.1.2.1 Constructors and Destructors

**5.43.1.2.1.1 virtual telux::data::net::IBridgeManager::~~IBridgeManager ( ) [virtual]**

Destructor for [IBridgeManager](#)

**5.43.1.2.2 Member Function Documentation****5.43.1.2.2.1 virtual telux::common::ServiceStatus telux::data::net::IBridgeManager::getServiceStatus ( ) [pure virtual]**

Checks the status of Bridge manager and returns the result.

**Returns**

SERVICE\_AVAILABLE If Bridge manager object is ready for service. SERVICE\_UNAVAILABLE If Bridge manager object is temporarily unavailable. SERVICE\_FAILED If Bridge manager object encountered an irrecoverable failure.

**5.43.1.2.2.2 virtual bool telux::data::net::IBridgeManager::isSubsystemReady ( ) [pure virtual]**

Checks if the Bridge manager subsystem is ready.

**Returns**

True if the Bridge Manager is ready for service, otherwise returns false.

**Deprecated** Use getServiceStatus API.

**5.43.1.2.2.3 virtual std::future<bool> telux::data::net::IBridgeManager::onSubsystemReady ( ) [pure virtual]**

Wait for Bridge manager subsystem to be ready.

**Returns**

A future that caller can wait until the Bridge Manager succeed/fail to be ready.

**Deprecated** Use InitResponseCb callback in factory API getBridgeManager.

**5.43.1.2.2.4 virtual telux::common::Status telux::data::net::IBridgeManager::enableBridge ( bool *enable*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]**

Enable/Disable the software bridge in the system. It will affect all the configured software bridges for various interfaces.

**Parameters**

in	<i>enable</i>	TRUE to enable, FALSE to disable the bridge
in	<i>callback</i>	Optional callback to get the response for enableBridge

**Returns**

Status of enableBridge request i.e. success or suitable status code.

**5.43.1.2.2.5** `virtual telux::common::Status telux::data::net::IBridgeManager::addBridge ( BridgeInfo config, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Add software bridge configuration for an interface.

**Parameters**

in	<i>config</i>	configuration for an interface
in	<i>callback</i>	Optional callback to get the response for addBridge

**Returns**

Status of addBridge request i.e. success or suitable status code.

**5.43.1.2.2.6** `virtual telux::common::Status telux::data::net::IBridgeManager::requestBridgeInfo ( BridgeInfoResponseCb callback ) [pure virtual]`

Request information about all the software bridge configurations in the system

**Parameters**

in	<i>callback</i>	Response callback with list of bridge configurations
----	-----------------	--

**Returns**

Status of requestBridgeInfo request i.e. success or suitable status code.

**5.43.1.2.2.7** `virtual telux::common::Status telux::data::net::IBridgeManager::removeBridge ( std::string ifaceName, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Delete a software bridge configuration for an interface.

**Parameters**

in	<i>ifaceName</i>	Name of the interface whose configuration needs to be deleted
in	<i>callback</i>	Optional callback to get the response for removeBridge

**Returns**

Status of removeBridge request i.e. success or suitable status code.

**5.43.1.2.2.8** `virtual telux::common::Status telux::data::net::IBridgeManager::registerListener ( std::weak_ptr< IBridgeListener > listener ) [pure virtual]`

Register Bridge Manager as listener for Data Service health events like data service available or data service not available.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IBridgeListener</a> object that processes the notification
----	-----------------	---

#### Returns

Status of registerListener success or suitable status code

**5.43.1.2.2.9** `virtual telux::common::Status telux::data::net::IBridgeManager::deregisterListener ( std::weak_ptr< IBridgeListener > listener ) [pure virtual]`

Removes a previously added listener.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IBridgeListener</a> object that needs to be removed
----	-----------------	--

#### Returns

Status of deregisterListener success or suitable status code

### 5.43.1.3 class telux::data::net::IBridgeListener

Interface for Bridge listener object. Client needs to implement this interface to get access to Bridge services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual [~IBridgeListener](#) ()

#### 5.43.1.3.1 Constructors and Destructors

**5.43.1.3.1.1** `virtual telux::data::net::IBridgeListener::~~IBridgeListener ( ) [virtual]`

Destructor for [IBridgeListener](#)

### 5.43.1.3.2 Member Function Documentation

#### 5.43.1.3.2.1 virtual void telux::data::net::IBridgeListener::onServiceStatusChange ( telux::common::↔ ServiceStatus *status* ) [virtual]

This function is called when service status changes.

#### Parameters

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

### 5.43.1.4 class telux::data::net::IFirewallManager

FirewallManager is a primary interface that filters and controls the network traffic on a pre-configured set of rules. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

#### Public member functions

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual bool isSubsystemReady ()=0
- virtual std::future< bool > onSubsystemReady ()=0
- virtual [telux::common::Status](#) setFirewall (int profileId, bool enable, bool allowPackets, [telux::common::ResponseCallback](#) callback=nullptr, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual [telux::common::Status](#) requestFirewallStatus (int profileId, [FirewallStatusCb](#) callback, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual [telux::common::Status](#) addFirewallEntry (int profileId, std::shared\_ptr< [IFirewallEntry](#) > entry, [telux::common::ResponseCallback](#) callback=nullptr, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual [telux::common::Status](#) requestFirewallEntries (int profileId, [FirewallEntriesCb](#) callback, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual [telux::common::Status](#) removeFirewallEntry (int profileId, uint32\_t handle, [telux::common::ResponseCallback](#) callback=nullptr, SlotId slotId=DEFAULT\_SLOT\_ID)=0

- virtual [telux::common::Status](#) disableDmz (int profileId, const [telux::data::IpFamilyType](#) ipType, [telux::common::ResponseCallback](#) callback=nullptr, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual [telux::common::Status](#) requestDmzEntry (int profileId, [DmzEntriesCb](#) dmzCb, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [IFirewallListener](#) > listener)=0
- virtual [telux::common::Status](#) deregisterListener (std::weak\_ptr< [IFirewallListener](#) > listener)=0
- virtual [telux::data::OperationType](#) getOperationType ()=0
- virtual ~[IFirewallManager](#) ()

### 5.43.1.4.1 Constructors and Destructors

**5.43.1.4.1.1** `virtual telux::data::net::IFirewallManager::~IFirewallManager ( ) [virtual]`

Destructor for [IFirewallManager](#)

### 5.43.1.4.2 Member Function Documentation

**5.43.1.4.2.1** `virtual telux::common::ServiceStatus telux::data::net::IFirewallManager::getServiceStatus ( ) [pure virtual]`

Checks the status of Firewall manager and returns the result.

#### Returns

SERVICE\_AVAILABLE If Firewall manager object is ready for service.

SERVICE\_UNAVAILABLE If Firewall manager object is temporarily unavailable.

SERVICE\_FAILED If Firewall manager object encountered an irrecoverable failure.

**5.43.1.4.2.2** `virtual bool telux::data::net::IFirewallManager::isSubsystemReady ( ) [pure virtual]`

Checks if the Firewall manager subsystem is ready.

#### Returns

True if Firewall Manager is ready for service, otherwise returns false.

**Deprecated** Use getServiceStatus API.

**5.43.1.4.2.3** `virtual std::future<bool> telux::data::net::IFirewallManager::onSubsystemReady ( ) [pure virtual]`

Wait for Firewall manager subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when firewall manager is ready.

**Deprecated** Use InitResponseCb callback in factory API getFirewallManager.

**5.43.1.4.2.4** `virtual telux::common::Status telux::data::net::IFirewallManager::setFirewall ( int profileId, bool enable, bool allowPackets, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Sets firewall configuration to enable or disable and update configuration to drop or accept the packets matching the rules.

in	<i>profileId</i>	Profile identifier on which firewall will be set.
in	<i>enable</i>	Indicates whether the firewall is enabled
in	<i>allowPackets</i>	Indicates whether to accept or drop packets matching the rules
in	<i>callback</i>	optional callback to get the response setFirewall
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

**Returns**

Status of setFirewall i.e. success or suitable status code.

**5.43.1.4.2.5** `virtual telux::common::Status telux::data::net::IFirewallManager::requestFirewallStatus ( int profileId, FirewallStatusCb callback, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Request status of firewall

**Parameters**

in	<i>profileId</i>	Profile identifier for which firewall status is requested.
in	<i>callback</i>	callback to get the response of requestFirewallStatus
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

**Returns**

Status of requestFirewallStatus i.e. success or suitable status code.

**5.43.1.4.2.6** `virtual telux::common::Status telux::data::net::IFirewallManager::addFirewallEntry ( int profileId, std::shared_ptr< IFirewallEntry > entry, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Adds the firewall rule

**Parameters**

in	<i>profileId</i>	Profile identifier on which firewall rule will be added.
in	<i>entry</i>	Firewall entry based on protocol type
in	<i>callback</i>	optional callback to get the response addFirewallEntry
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

**Returns**

Status of addFirewallEntry i.e. success or suitable status code.

**5.43.1.4.2.7** `virtual telux::common::Status telux::data::net::IFirewallManager::requestFirewallEntries ( int profileId, FirewallEntriesCb callback, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Request Firewall rules

in	<i>profileId</i>	Profile identifier on which firewall entries are retrieved.
in	<i>callback</i>	callback to get the response requestFirewallEntries.
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

#### Returns

Status of requestFirewallEntries i.e. success or suitable status code.

**5.43.1.4.2.8** `virtual telux::common::Status telux::data::net::IFirewallManager::removeFirewallEntry ( int profileId, uint32_t handle, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Remove firewall entry

#### Parameters

in	<i>profileId</i>	Profile identifier on which firewall entry will be removed.
in	<i>handle</i>	handle of Firewall entry to be removed. To retrieve the handle, first use <a href="#">requestFirewallEntries()</a> to get the list of entries added in the system. And then use <a href="#">IFirewallEntry::getHandle()</a>
in	<i>callback</i>	callback to get the response removeFirewallEntry
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

#### Returns

Status of removeFirewallEntry i.e. success or suitable status code.

**5.43.1.4.2.9** `virtual telux::common::Status telux::data::net::IFirewallManager::enableDmz ( int profileId, const std::string ipAddr, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Enable demilitarized zone (DMZ)

#### Parameters

in	<i>profileId</i>	Profile identifier on which DMZ will be enabled.
in	<i>ipAddr</i>	IP address for which DMZ will be enabled
in	<i>callback</i>	optional callback to get the response addDmz
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

**Returns**

Status of enableDmz i.e. success or suitable status code.

**5.43.1.4.2.10** `virtual telux::common::Status telux::data::net::IFirewallManager::disableDmz ( int profileId, const telux::data::IpFamilyType ipType, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Disable demilitarized zone (DMZ)

**Parameters**

in	<i>profileId</i>	Profile identifier on which DMZ will be disabled.
in	<i>ipType</i>	Specify IP type of the DMZ to be disabled
in	<i>callback</i>	optional callback to get the response removeDmz
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

**Returns**

Status of disableDmz i.e. success or suitable status code.

**5.43.1.4.2.11** `virtual telux::common::Status telux::data::net::IFirewallManager::requestDmzEntry ( int profileId, DmzEntriesCb dmzCb, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Request DMZ entry that was previously set using enableDmz API

**Parameters**

in	<i>profileId</i>	Profile identifier on which DMZ entries are requested.
in	<i>dmzCb</i>	callback to get the response requestDmzEntry
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

**Returns**

Status of requestDmzEntry i.e. success or suitable status code.

**5.43.1.4.2.12** `virtual telux::common::Status telux::data::net::IFirewallManager::registerListener ( std::weak_ptr< IFirewallListener > listener ) [pure virtual]`

Register Firewall Manager as listener for Data Service health events like data service available or data service not available.

**Parameters**

in	<i>listener</i>	pointer of <a href="#">IFirewallListener</a> object that processes the notification
----	-----------------	---

**Returns**

Status of registerListener success or suitable status code

**5.43.1.4.2.13** `virtual telux::common::Status telux::data::net::IFirewallManager::deregisterListener ( std::weak_ptr< IFirewallListener > listener ) [pure virtual]`

Removes a previously added listener.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IFirewallListener</a> object that needs to be removed
----	-----------------	--

#### Returns

Status of deregisterListener success or suitable status code

**5.43.1.4.2.14** `virtual telux::data::OperationType telux::data::net::IFirewallManager::getOperationType ( ) [pure virtual]`

Get the associated operation type for this instance.

#### Returns

OperationType of getOperationType i.e. LOCAL or REMOTE.

### 5.43.1.5 class telux::data::net::IFirewallEntry

Firewall entry class is used for configuring firewall rules.

#### Public member functions

- virtual `std::shared_ptr< IipFilter > getIPProtocolFilter ()=0`
- virtual `telux::data::Direction getDirection ()=0`
- virtual `telux::data::IpFamilyType getIpFamilyType ()=0`
- virtual `uint32_t getHandle ()=0`
- virtual `~IFirewallEntry ()`

#### Static Public Attributes

- static const `uint32_t INVALID_HANDLE = 0`

#### 5.43.1.5.1 Constructors and Destructors

**5.43.1.5.1.1** `virtual telux::data::net::IFirewallEntry::~IFirewallEntry ( ) [virtual]`

Destructor for [IFirewallEntry](#)

### 5.43.1.5.2 Member Function Documentation

**5.43.1.5.2.1** `virtual std::shared_ptr<IpFilter> telux::data::net::IFirewallEntry::getProtocolFilter ( )`  
[pure virtual]

Get IPProtocol filter type

#### Returns

[telux::data::IpFilter](#).

**5.43.1.5.2.2** `virtual telux::data::Direction telux::data::net::IFirewallEntry::getDirection ( )` [pure virtual]

Get firewall direction

#### Returns

[telux::data::Direction](#).

**5.43.1.5.2.3** `virtual telux::data::IpFamilyType telux::data::net::IFirewallEntry::getIpFamilyType ( )`  
[pure virtual]

Get Ip FamilyType

#### Returns

[telux::data::IpFamilyType](#).

**5.43.1.5.2.4** `virtual uint32_t telux::data::net::IFirewallEntry::getHandle ( )` [pure virtual]

Get the unique handle identifying this Firewall entry in the system

#### Returns

uint32\_t handle if initialized or INVALID\_HANDLE otherwise

### 5.43.1.5.3 Field Documentation

**5.43.1.5.3.1** `const uint32_t telux::data::net::IFirewallEntry::INVALID_HANDLE = 0` [static]

### 5.43.1.6 class telux::data::net::IFirewallListener

Interface for Firewall listener object. Client needs to implement this interface to get access to Firewall services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual [~IFirewallListener](#) ()

**5.43.1.6.1 Constructors and Destructors**

**5.43.1.6.1.1** virtual [telux::data::net::IFirewallListener::~IFirewallListener](#) ( ) [[virtual](#)]

Destructor for [IFirewallListener](#)

**5.43.1.6.2 Member Function Documentation**

**5.43.1.6.2.1** virtual void [telux::data::net::IFirewallListener::onServiceStatusChange](#) ( [telux::common::ServiceStatus](#) *status* ) [[virtual](#)]

This function is called when service status changes.

**Parameters**

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

**5.43.1.7 struct [telux::data::net::L2tpSessionConfig](#)**

L2TP tunnel sessions configuration

**Data fields**

Type	Field	Description
uint32_t	locId	Local session id
uint32_t	peerId	Peer session id

**5.43.1.8 struct [telux::data::net::L2tpTunnelConfig](#)**

L2TP tunnel configuration

**Data fields**

Type	Field	Description
<a href="#">L2tpProtocol</a>	prot	Encapsulation protocols
uint32_t	locId	Local tunnel id
uint32_t	peerId	Peer tunnel id
uint32_t	localUdpPort	Local udp port - if UDP encapsulation is used
uint32_t	peerUdpPort	Peer udp port - if IP encapsulation is used
string	peerIpv6Addr	Peer IPv6 Address - for Ipv6 tunnels
string	peerIpv4Addr	Peer IPv4 Address - for Ipv4 tunnels
string	locIface	interface name to create L2TP tunnel on
<a href="#">IpFamilyType</a>	ipType	Ip family type <a href="#">telux::data::IpFamilyType</a>

Type	Field	Description
vector< <a href="#">L2tp↔SessionConfig</a> >	sessionConfig	List of L2tp tunnel sessions

### 5.43.1.9 struct telux::data::net::L2tpSysConfig

L2TP Configuration

#### Data fields

Type	Field	Description
vector< <a href="#">L2tp↔TunnelConfig</a> >	configList	List of L2tp tunnel configurations
bool	enableMtu	Enable MTU size setting on underlying interfaces to avoid segmentation
bool	enableTcpMss	Enable TCP MSS clamping on L2TP interfaces to avoid segmentation
uint32_t	mtuSize	Current MTU size in bytes

### 5.43.1.10 class telux::data::net::IL2tpManager

L2tpManager is a primary interface for configuring L2TP Service. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

#### Public member functions

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual bool isSubsystemReady ()=0
- virtual std::future< bool > onSubsystemReady ()=0
- virtual [telux::common::Status](#) setConfig (bool enable, bool enableMss, bool enableMtu, [telux::common::ResponseCallback](#) callback=nullptr, uint32\_t mtuSize=0)=0
- virtual [telux::common::Status](#) addTunnel (const [L2tpTunnelConfig](#) &l2tpTunnelConfig, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) requestConfig ([L2tpConfigCb](#) l2tpConfigCb)=0
- virtual [telux::common::Status](#) removeTunnel (uint32\_t tunnelId, [telux::common::ResponseCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [IL2tpListener](#) > listener)=0
- virtual [telux::common::Status](#) deregisterListener (std::weak\_ptr< [IL2tpListener](#) > listener)=0
- virtual ~[IL2tpManager](#) ()

### 5.43.1.10.1 Constructors and Destructors

**5.43.1.10.1.1** `virtual telux::data::net::IL2tpManager::~~IL2tpManager ( ) [virtual]`

Destructor for [IL2tpManager](#)

### 5.43.1.10.2 Member Function Documentation

**5.43.1.10.2.1** `virtual telux::common::ServiceStatus telux::data::net::IL2tpManager::getServiceStatus ( ) [pure virtual]`

Checks the status of L2tp manager and returns the result.

#### Returns

SERVICE\_AVAILABLE If L2tp manager is ready for service. SERVICE\_UNAVAILABLE If L2tp manager is temporarily unavailable. SERVICE\_FAILED - If L2tp manager encountered an irrecoverable failure.

**5.43.1.10.2.2** `virtual bool telux::data::net::IL2tpManager::isSubsystemReady ( ) [pure virtual]`

Checks if the L2tp manager subsystem is ready.

#### Returns

True if L2tp Manager is ready for service, otherwise returns false.

#### Note

This API will be deprecated. getServiceStatus API is recommended as an alternative

**5.43.1.10.2.3** `virtual std::future<bool> telux::data::net::IL2tpManager::onSubsystemReady ( ) [pure virtual]`

Wait for L2tp manager subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when L2tp manager is ready.

#### Note

This API will be deprecated. Callback of type InitResponseCb argument in data factory API getL2tpManager is recommended as an alternative.

**5.43.1.10.2.4 virtual telux::common::Status telux::data::net::l2tpManager::setConfig ( bool *enable*, bool *enableMss*, bool *enableMtu*, telux::common::ResponseCallback *callback* = nullptr, uint32\_t *mtuSize* = 0 ) [pure virtual]**

Enable L2TP for unmanaged Tunnel State

#### Parameters

in	<i>enable</i>	Enable/Disable L2TP for unmanaged tunnels.
in	<i>enableMss</i>	Enable/Disable TCP MSS to be clamped on L2TP interfaces to avoid Segmentation
in	<i>enableMtu</i>	Enable/Disable MTU size to be set on underlying interfaces to avoid fragmentation
in	<i>callback</i>	optional callback to get the response setConfig
in	<i>mtuSize</i>	optional MTU size in bytes. If not set, MTU size will be set to default 1422 bytes

#### Returns

Status of setConfig i.e. success or suitable status code.

**5.43.1.10.2.5 virtual telux::common::Status telux::data::net::l2tpManager::addTunnel ( const L2tpTunnelConfig & *l2tpTunnelConfig*, telux::common::ResponseCallback *callback* = nullptr ) [pure virtual]**

Set L2TP Configuration for one tunnel

#### Parameters

in	<i>l2tpTunnelConfig</i>	Configuration to be set telux::net::L2tpTunnelConfig
in	<i>callback</i>	Optional callback to get the response addTunnel

#### Returns

Status of addTunnel i.e. success or suitable status code.

**5.43.1.10.2.6 virtual telux::common::Status telux::data::net::l2tpManager::requestConfig ( L2tpConfigCb *l2tpConfigCb* ) [pure virtual]**

Get Current L2TP Configuration

#### Parameters

in	<i>l2tpConfigCb</i>	Asynchronous callback to get current L2TP configurations
----	---------------------	--

#### Returns

Status of requestConfig i.e. success or suitable status code.

**5.43.1.10.2.7** virtual `telux::common::Status telux::data::net::IL2tpManager::removeTunnel ( uint32_t tunnelId, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Remove L2TP Tunnel

#### Parameters

in	<i>tunnelId</i>	Tunnel ID to be removed
in	<i>callback</i>	optional callback to get the response removeConfig

#### Returns

Status of removeTunnel i.e. success or suitable status code.

**5.43.1.10.2.8** virtual `telux::common::Status telux::data::net::IL2tpManager::registerListener ( std::weak_ptr< IL2tpListener > listener ) [pure virtual]`

Register L2TP Manager as listener for Data Service health events like data service available or data service not available.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IL2tpListener</a> object that processes the notification
----	-----------------	---

#### Returns

Status of registerListener success or suitable status code

**5.43.1.10.2.9** virtual `telux::common::Status telux::data::net::IL2tpManager::deregisterListener ( std::weak_ptr< IL2tpListener > listener ) [pure virtual]`

Removes a previously added listener.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">IL2tpListener</a> object that needs to be removed
----	-----------------	--

#### Returns

Status of deregisterListener success or suitable status code

### 5.43.1.11 class `telux::data::net::IL2tpListener`

Interface for L2TP listener object. Client needs to implement this interface to get access to L2TP services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual [~IL2tpListener](#) ()

**5.43.1.11.1 Constructors and Destructors**

**5.43.1.11.1.1** virtual [telux::data::net::IL2tpListener::~IL2tpListener](#) ( ) [[virtual](#)]

Destructor for [IL2tpListener](#)

**5.43.1.11.2 Member Function Documentation**

**5.43.1.11.2.1** virtual void [telux::data::net::IL2tpListener::onServiceStatusChange](#) ( [telux::common::ServiceStatus](#) *status* ) [[virtual](#)]

This function is called when service status changes.

**Parameters**

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

**5.43.1.12 struct telux::data::net::NatConfig**

Structure represents Network Address Translation (NAT) configuration

**Data fields**

Type	Field	Description
string	addr	Private IP address
uint16_t	port	Private port
uint16_t	globalPort	Global port
<a href="#">IpProtocol</a>	proto	IP protocol <a href="#">telux::net::IpProtocol</a>

**5.43.1.13 class telux::data::net::INatManager**

NatManager is a primary interface for configuring static network address translation(SNAT) and DMZ (demilitarized zone). It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) [getServiceStatus](#) ()=0
- virtual bool [isSubsystemReady](#) ()=0
- virtual std::future< bool > [onSubsystemReady](#) ()=0
- virtual [telux::common::Status](#) [addStaticNatEntry](#) (int profileId, const [NatConfig](#) &snatConfig,

`telux::common::ResponseCallback` callback=nullptr, SlotId slotId=DEFAULT\_SLOT\_ID)=0

- virtual `telux::common::Status removeStaticNatEntry` (int profileId, const `NatConfig` &snatConfig, `telux::common::ResponseCallback` callback=nullptr, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual `telux::common::Status requestStaticNatEntries` (int profileId, `StaticNatEntriesCb` snatEntriesCb, SlotId slotId=DEFAULT\_SLOT\_ID)=0
- virtual `telux::common::Status registerListener` (std::weak\_ptr< `INatListener` > listener)=0
- virtual `telux::common::Status deregisterListener` (std::weak\_ptr< `INatListener` > listener)=0
- virtual `telux::data::OperationType getOperationType` ()=0
- virtual `~INatManager` ()

### 5.43.1.13.1 Constructors and Destructors

**5.43.1.13.1.1** virtual `telux::data::net::INatManager::~INatManager` ( ) [virtual]

Destructor for `INatManager`

### 5.43.1.13.2 Member Function Documentation

**5.43.1.13.2.1** virtual `telux::common::ServiceStatus telux::data::net::INatManager::getServiceStatus` ( ) [pure virtual]

Checks the status of NAT manager and returns the result.

#### Returns

`SERVICE_AVAILABLE` If Nat manager object is ready for service. `SERVICE_UNAVAILABLE` If Nat manager object is temporarily unavailable. `SERVICE_FAILED` - If Nat manager object encountered an irrecoverable failure.

**5.43.1.13.2.2** virtual `bool telux::data::net::INatManager::isSubsystemReady` ( ) [pure virtual]

Checks if the NAT manager subsystem is ready.

#### Returns

True if NAT Manager is ready for service, otherwise returns false.

**Deprecated** Use `getServiceStatus` API.

### 5.43.1.13.2.3 `virtual std::future<bool> telux::data::net::INatManager::onSubsystemReady ( ) [pure virtual]`

Wait for NAT manager subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when NAT manager is ready.

**Deprecated** Use InitResponseCb callback in factory API `getNatManager`.

### 5.43.1.13.2.4 `virtual telux::common::Status telux::data::net::INatManager::addStaticNatEntry ( int profileId, const NatConfig & snatConfig, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Adds a static Network Address Translation (NAT) entry in the NAT table, these entries are persistent across object, connection and reboot lifetimes. To remove an entry it needs a explicit call to `removeStaticNatEntry()` API, it supports both IPv4 and IPv6

#### Parameters

in	<i>profileId</i>	Profile identifier to which static entry will be mapped to.
in	<i>snatConfig</i>	snatConfiguration <code>telux::net::NatConfig</code>
in	<i>callback</i>	optional callback to get the response <code>addStaticNatEntry</code>
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

#### Returns

Status of `addStaticNatEntry` i.e. success or suitable status code.

### 5.43.1.13.2.5 `virtual telux::common::Status telux::data::net::INatManager::removeStaticNatEntry ( int profileId, const NatConfig & snatConfig, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Removes a static Network Address Translation (NAT) entry in the NAT table, it supports both IPv4 and IPv6

#### Parameters

in	<i>profileId</i>	Profile identifier to which static entry will be removed from.
in	<i>snatConfig</i>	snatConfiguration <code>telux::net::NatConfig</code>
in	<i>callback</i>	optional callback to get the response <code>removeStaticNatEntry</code>
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

#### Returns

Status of `removeStaticNatEntry` i.e. success or suitable status code.

**5.43.1.13.2.6** `virtual telux::common::Status telux::data::net::INatManager::requestStaticNatEntries ( int profileId, StaticNatEntriesCb snatEntriesCb, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Request list of static nat entries available in the NAT table

#### Parameters

in	<i>profileId</i>	Profile identifier to which static entries will be retrieved.
in	<i>snatEntriesCb</i>	Asynchronous callback to get the list of static Network Address Translation (NAT) entries
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id

#### Returns

Status of requestStaticNatEntries i.e. success or suitable status code.

**5.43.1.13.2.7** `virtual telux::common::Status telux::data::net::INatManager::registerListener ( std::weak_ptr< INatListener > listener ) [pure virtual]`

Register Nat Manager as listener for Data Service health events like data service available or data service not available.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">INatListener</a> object that processes the notification
----	-----------------	--

#### Returns

Status of registerListener success or suitable status code

**5.43.1.13.2.8** `virtual telux::common::Status telux::data::net::INatManager::deregisterListener ( std::weak_ptr< INatListener > listener ) [pure virtual]`

Removes a previously added listener.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">INatListener</a> object that needs to be removed
----	-----------------	---

#### Returns

Status of deregisterListener success or suitable status code

#### 5.43.1.13.2.9 virtual telux::data::OperationType telux::data::net::INatManager::getOperationType ( ) [pure virtual]

Get the associated operation type for this instance.

#### Returns

OperationType of getOperationType i.e. LOCAL or REMOTE.

#### 5.43.1.14 class telux::data::net::INatListener

Interface for Nat listener object. Client needs to implement this interface to get access to Nat services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void [onServiceStatusChange](#) (telux::common::ServiceStatus status)
- virtual [~INatListener](#) ()

#### 5.43.1.14.1 Constructors and Destructors

##### 5.43.1.14.1.1 virtual telux::data::net::INatListener::~~INatListener ( ) [virtual]

Destructor for [INatListener](#)

#### 5.43.1.14.2 Member Function Documentation

##### 5.43.1.14.2.1 virtual void telux::data::net::INatListener::onServiceStatusChange ( telux::common::↔ ServiceStatus *status* ) [virtual]

This function is called when service status changes.

#### Parameters

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

#### 5.43.1.15 class telux::data::net::ISocksManager

SocksManager is a primary interface for configuring legacy Socks proxy server. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

**Public member functions**

- virtual `telux::common::ServiceStatus getServiceStatus ()=0`
- virtual `bool isSubsystemReady ()=0`
- virtual `std::future< bool > onSubsystemReady ()=0`
- virtual `telux::common::Status enableSocks (bool enable, telux::common::ResponseCallback callback=nullptr)=0`
- virtual `telux::common::Status registerListener (std::weak_ptr< ISocksListener > listener)=0`
- virtual `telux::common::Status deregisterListener (std::weak_ptr< ISocksListener > listener)=0`
- virtual `telux::data::OperationType getOperationType ()=0`
- virtual `~ISocksManager ()`

**5.43.1.15.1 Constructors and Destructors**

**5.43.1.15.1.1** `virtual telux::data::net::ISocksManager::~ISocksManager ( ) [virtual]`

Destructor for Socks Manager

**5.43.1.15.2 Member Function Documentation**

**5.43.1.15.2.1** `virtual telux::common::ServiceStatus telux::data::net::ISocksManager::getServiceStatus ( ) [pure virtual]`

Checks the status of SocksManager and returns the result.

**Returns**

`SERVICE_AVAILABLE` If Socks manager object is ready for service. `SERVICE_UNAVAILABLE` If Socks manager object is temporarily unavailable. `SERVICE_FAILED` - If Socks manager object encountered an irrecoverable failure.

**5.43.1.15.2.2** `virtual bool telux::data::net::ISocksManager::isSubsystemReady ( ) [pure virtual]`

Checks if the SocksManager subsystem is ready.

**Returns**

True if SocksManager is ready for service, otherwise returns false.

**Deprecated** Use `getServiceStatus` API..

**5.43.1.15.2.3** `virtual std::future<bool> telux::data::net::ISocksManager::onSubsystemReady ( )`  
**[pure virtual]**

Wait for SocksManager subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when Socksanager is ready.

**Deprecated** Use InitResponseCb callback in factory API getSocksManager.

**5.43.1.15.2.4** `virtual telux::common::Status telux::data::net::ISocksManager::enableSocks ( bool`  
`enable, telux::common::ResponseCallback callback = nullptr )` **[pure virtual]**

Enable or Disable Socks proxy service.

#### Parameters

in	<i>enable</i>	true: enable proxy, false: disable proxy
in	<i>callback</i>	optional callback to get the operation error code if any

#### Returns

Status of proxy enablement i.e. success or suitable status code.

**5.43.1.15.2.5** `virtual telux::common::Status telux::data::net::ISocksManager::registerListener (`  
`std::weak_ptr< ISocksListener > listener )` **[pure virtual]**

Register Socks Manager as listener for Data Service health events like data service available or data service not available.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">ISocksListener</a> object that processes the notification
----	-----------------	--

#### Returns

Status of registerListener success or suitable status code

**5.43.1.15.2.6** `virtual telux::common::Status telux::data::net::ISocksManager::deregisterListener (`  
`std::weak_ptr< ISocksListener > listener )` **[pure virtual]**

Removes a previously added listener.

#### Parameters

in	<i>listener</i>	pointer of <a href="#">ISocksListener</a> object that needs to be removed
----	-----------------	---

**Returns**

Status of deregisterListener success or suitable status code

**5.43.1.15.2.7** `virtual telux::data::OperationType telux::data::net::ISocksManager::getOperationType ( )`  
`[pure virtual]`

Get the associated operation type for this instance.

**Returns**

OperationType of getOperationType i.e. LOCAL or REMOTE.

**5.43.1.16 class telux::data::net::ISocksListener**

Interface for Socks listener object. Client needs to implement this interface to get access to Socks services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

**Public member functions**

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)

**5.43.1.16.2.1** `virtual void telux::data::net::ISocksListener::onServiceStatusChange ( telux::common::↔`  
`ServiceStatus status )` `[virtual]`

This function is called when service status changes.

**Parameters**

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

### 5.43.1.17 class telux::data::net::IVlanManager

VlanManager is a primary interface for configuring VLAN (Virtual Local Area Network). It provides APIs for create, query, remove VLAN interfaces and associate or disassociate with profile IDs. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready.

#### Public member functions

#### 5.43.1.17.1 Constructors and Destructors

5.43.1.17.1.1 virtual [telux::data::net::IVlanManager::~~IVlanManager](#) ( ) [[virtual](#)]

Destructor for [IVlanManager](#)

#### 5.43.1.17.2 Member Function Documentation

**5.43.1.17.2.1** `virtual telux::common::ServiceStatus telux::data::net::IVlanManager::getServiceStatus ( ) [pure virtual]`

Checks the status of VLAN manager and returns the result.

#### Returns

`SERVICE_AVAILABLE` If VLAN manager object is ready for service. `SERVICE_UNAVAILABLE` If VLAN manager object is temporarily unavailable. `SERVICE_FAILED` - If VLAN manager object encountered an irrecoverable failure.

**5.43.1.17.2.2** `virtual bool telux::data::net::IVlanManager::isSubsystemReady ( ) [pure virtual]`

Checks if the VLAN manager subsystem is ready.

#### Returns

True if VLAN Manager is ready for service, otherwise returns false.

**Deprecated** Use `getServiceStatus` API.

**5.43.1.17.2.3** `virtual std::future<bool> telux::data::net::IVlanManager::onSubsystemReady ( ) [pure virtual]`

Wait for VLAN manager subsystem to be ready.

#### Returns

A future that caller can wait on to be notified when VLAN manager is ready.

**Deprecated** Use `InitResponseCb` callback in factory API `getVlanManager`.

**5.43.1.17.2.4** `virtual telux::common::Status telux::data::net::IVlanManager::createVlan ( const VlanConfig & vlanConfig, CreateVlanCb callback = nullptr ) [pure virtual]`

Create a VLAN associated with multiple interfaces Creates VLAN on hardware interface `telux::data::InterfaceType`, assigns VLAN id, assigns VLAN priority level (according to IEEE 802.1p priority code point-PCP), and sets whether traffic on this VLAN needs to be accelerated. If platform does not support assigning priorities to VLANs and priority is set to value other than 0, `telux::common::Status::NOTSUPPORTED` is returned. If platform supports Vlan priority, all traffic coming from WWAN or LAN are stamped with priority before sending traffic to tethered client.

#### Note

if interface configured as VLAN for the first time, it may trigger auto reboot.

in	<i>vlanConfig</i>	VLAN configuration
out	<i>callback</i>	optional callback to get the response createVlan

**Returns**

Immediate status of [createVlan\(\)](#) request sent i.e. success or suitable status code.

**5.43.1.17.2.5** `virtual telux::common::Status telux::data::net::IVlanManager::removeVlan ( int16_t vlanId, InterfaceType ifaceType, telux::common::ResponseCallback callback = nullptr ) [pure virtual]`

Remove VLAN configuration

**Note**

This will delete all clients associated with interface

**Parameters**

in	<i>vlanId</i>	VLAN ID
in	<i>ifaceType</i>	telux::net::InterfaceType
out	<i>callback</i>	optional callback to get the response removeVlan

**Returns**

Immediate status of [removeVlan\(\)](#) request sent i.e. success or suitable status code.

**5.43.1.17.2.6** `virtual telux::common::Status telux::data::net::IVlanManager::queryVlanInfo ( QueryVlanResponseCb callback ) [pure virtual]`

Query information about all the VLANs in the system

**Parameters**

out	<i>callback</i>	Response callback with list of configured VLANs
-----	-----------------	---

**Returns**

Immediate status of [queryVlanInfo\(\)](#) request sent i.e. success or suitable status code.

**5.43.1.17.2.7** `virtual telux::common::Status telux::data::net::IVlanManager::bindWithProfile ( int profileId, int vlanId, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Bind a VLAN with a particular profile id and slot id. When a WWAN network interface is brought up using [IDataConnectionManager::startDataCall](#) on that profile id and slot id, that interface will be accessible from this VLAN. The behavior of this API is dependent on platform/system configuration. If the platform is configured to allow multiple VLANs to be bound to the same profile id - slot id pair then:

- Binding multiple VLANs to any profile id - slot id pair can be achieved by calling this API with each

VLAN id. Each VLAN will be associated with it's own bridge.

- Reboot is not triggered with any bind operation. If the platform is not configured to allow multiple VLANs to be bound to the same profile id - slot id pair then:
- Binding VLAN to default profile id and slot id will associate it with bridge0 and trigger automatic reboot.
- Binding VLAN to any other profile id and slot id will associate it with own bridge.
- Multiple VLAN binding attempt to any profile id or slot id will result in error `telux::common::ErrorCode::INVALID_OPERATION` This setting will be persistent across multiple boots.

#### Parameters

in	<i>profileId</i>	profile id for VLAN association
in	<i>vlanId</i>	sets VLAN id
out	<i>callback</i>	callback to get the response of <code>associateWithProfileId</code> API
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id.

#### Returns

Immediate status of `associateWithProfileId()` request sent i.e. success or suitable status code.

**5.43.1.17.2.8** `virtual telux::common::Status telux::data::net::IVlanManager::unbindFromProfile ( int profileId, int vlanId, telux::common::ResponseCallback callback = nullptr, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Unbind VLAN id from given slot id and profile id This setting will be persistent across multiple boots.

#### Parameters

in	<i>profileId</i>	profile id for VLAN association
in	<i>vlanId</i>	VLAN id
in	<i>callback</i>	callback to get the response of <code>associateWithProfileId</code> API
in	<i>slotId</i>	Specify slot id which has the sim that contains profile id .

#### Returns

Immediate status of `disassociateFromProfileId()` request sent i.e. success or suitable status code

**5.43.1.17.2.9** `virtual telux::common::Status telux::data::net::IVlanManager::queryVlanMappingList ( VlanMappingResponseCb callback, SlotId slotId = DEFAULT_SLOT_ID ) [pure virtual]`

Query VLAN mapping of profile id and VLAN id on specified sim

#### Parameters

in	<i>callback</i>	callback to get the response of <code>queryVlanMappingList</code> API
----	-----------------	---

in	<i>slotId</i>	Specify slot id which has the sim that contains profile id mapping to VLAN id.
----	---------------	--

**Returns**

Immediate status of [queryVlanMappingList\(\)](#) request sent i.e. success or suitable status code

#### 5.43.1.17.2.10 virtual telux::common::Status telux::data::net::IVlanManager::registerListener ( std::weak\_ptr< IVlanListener > *listener* ) [pure virtual]

Register VLAN Manager as a listener for Data Service health events like data service available or data service not available.

**Parameters**

in	<i>listener</i>	pointer of <a href="#">IVlanListener</a> object that processes the notification
----	-----------------	---

**Returns**

Status of registerListener success or suitable status code

#### 5.43.1.17.2.11 virtual telux::common::Status telux::data::net::IVlanManager::deregisterListener ( std::weak\_ptr< IVlanListener > *listener* ) [pure virtual]

Removes a previously added listener.

**Parameters**

in	<i>listener</i>	pointer of <a href="#">IVlanListener</a> object that needs to be removed
----	-----------------	--

**Returns**

Status of deregisterListener success or suitable status code

#### 5.43.1.17.2.12 virtual telux::data::OperationType telux::data::net::IVlanManager::getOperationType ( ) [pure virtual]

Get the associated operation type for this instance.

**Returns**

OperationType of getOperationType i.e. LOCAL or REMOTE.

### 5.43.1.18 class telux::data::net::IVlanListener

Interface for VLAN listener object. Client needs to implement this interface to get access to Socks services notifications like onServiceStatusChange.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

#### Public member functions

- virtual void onServiceStatusChange (telux::common::ServiceStatus status)
- virtual void onHwAccelerationChanged (const ServiceState state)
- virtual ~IVlanListener ()

#### 5.43.1.18.1 Constructors and Destructors

5.43.1.18.1 virtual telux::data::net::IVlanListener::~~IVlanListener ( ) [virtual]

Destructor for [IVlanListener](#)

#### 5.43.1.18.2 Member Function Documentation

5.43.1.18.2.1 virtual void telux::data::net::IVlanListener::onServiceStatusChange ( telux::common::↔ ServiceStatus *status* ) [virtual]

This function is called when service status changes.

#### Parameters

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

5.43.1.18.2.2 virtual void telux::data::net::IVlanListener::onHwAccelerationChanged ( const ServiceState *state* ) [virtual]

This function is called when there is a change in IPA Connection Manager daemon state.

#### Parameters

in	<i>state</i>	New state of IPA connection Manager daemon Active/Inactive
----	--------------	--

## 5.43.2 Enumeration Type Documentation

5.43.2.1 enum telux::data::net::BridgeFaceType [strong]

Interface types supported for bridge configuration

**Enumerator****UNKNOWN****WLAN\_AP** Wireless Local Area Network (WLAN) in AP mode**WLAN\_STA** Wireless Local Area Network (WLAN) in STA mode**ETH** Ethernet (ETH)**5.43.2.2 enum telux::data::net::L2tpProtocol [strong]**

L2TP encapsulation protocols

**Enumerator****NONE****IP** IP Protocol used for encapsulation**UDP** UDP Protocol used for encapsulation

## 5.44 Telematics\_supp\_services

### 5.44.1 Data Structure Documentation

#### 5.44.1.1 class telux::tel::ISuppServicesListener

A listener class for receiving supplementary services notifications. The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

##### Public member functions

- virtual [~ISuppServicesListener](#) ()

*Destroy the [ISuppServicesListener](#) object.*

##### 5.44.1.1.1 Constructors and Destructors

###### 5.44.1.1.1.1 virtual telux::tel::ISuppServicesListener::~~ISuppServicesListener ( ) [virtual]

Destroy the [ISuppServicesListener](#) object.

#### 5.44.1.2 struct telux::tel::ForwardInfo

Represents parameters for forwarding.

##### Data fields

Type	Field	Description
<a href="#">SuppServices↔ Status</a>	status	Status of the supplementary service
<a href="#">ServiceClass</a>	serviceClass	Service class
string	number	Phone number to which the call to be forwarded
uint8_t	noReplyTimer	No reply timer

#### 5.44.1.3 struct telux::tel::ForwardReq

Represents parameters required for forwarding request.

##### Data fields

Type	Field	Description
<a href="#">Forward↔ Operation</a>	operation	Type of operation for forwarding
<a href="#">ForwardReason</a>	reason	Reason for call forwarding <a href="#">telux::tel::ForwardReason</a>
<a href="#">ServiceClass</a>	serviceClass	Service Class for operation <a href="#">telux::tel::ServiceClass</a>
string	number	Number to which call has to be forwarded. This parameter is required only for registration purpose only. <a href="#">telux::tel::ForwardOperation::REGISTER</a>
uint8_t	noReplyTimer	Timer for no reply operation. Required only for no reply forward reason. <a href="#">telux::tel::ForwardReason::NOREPLY</a> .

### 5.44.1.4 class telux::tel::ISuppServicesManager

[ISuppServicesManager](#) is the interface to provide supplementary services like call forwarding and call waiting.

#### Public member functions

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual [telux::common::Status](#) setCallWaitingPref ([SuppServicesStatus](#) suppSvcStatus, [SetSuppSvcPrefCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) requestCallWaitingPref ([GetCallWaitingPrefCb](#) callback)=0
- virtual [telux::common::Status](#) setForwardingPref ([ForwardReq](#) forwardReq, [SetSuppSvcPrefCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) requestForwardingPref ([ServiceClass](#) serviceClass, [ForwardReason](#) reason, [GetForwardingPrefCb](#) callback)=0
- virtual [telux::common::Status](#) setOirPref ([ServiceClass](#) serviceClass, [SuppServicesStatus](#) suppSvcStatus, [SetSuppSvcPrefCallback](#) callback=nullptr)=0
- virtual [telux::common::Status](#) requestOirPref ([ServiceClass](#) serviceClass, [GetOirPrefCb](#) callback)=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [ISuppServicesListener](#) > listener)=0
- virtual [telux::common::Status](#) removeListener (std::weak\_ptr< [ISuppServicesListener](#) > listener)=0
- virtual [~ISuppServicesManager](#) ()

#### 5.44.1.4.1 Constructors and Destructors

5.44.1.4.1.1 virtual [telux::tel::ISuppServicesManager::~ISuppServicesManager](#) ( ) [virtual]

Destructor for [ISupplementaryServicesManager](#)

#### 5.44.1.4.2 Member Function Documentation

5.44.1.4.2.1 virtual [telux::common::ServiceStatus](#) [telux::tel::ISuppServicesManager::getServiceStatus](#) ( ) [pure virtual]

This status indicates whether the [ISuppServicesManager](#) object is in a usable state.

#### Returns

- SERVICE\_AVAILABLE - If [ISuppServicesManager](#) manager is ready for service.
- SERVICE\_UNAVAILABLE - If [ISuppServicesManager](#) manager is temporarily unavailable.
- SERVICE\_FAILED - If [ISuppServicesManager](#) manager encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.44.1.4.2.2 virtual telux::common::Status telux::tel::ISuppServicesManager::setCallWaitingPref ( SuppServicesStatus *suppSvcStatus*, SetSuppSvcPrefCallback *callback = nullptr* ) [pure virtual]**

Enable/disable call waiting on device.

On platforms with Access control enabled, Caller needs to have TELUX\_TEL\_SUPP\_SERVICES permissions to invoke this API successfully.

#### Parameters

in	<i>suppSvcStatus</i>	- Call waiting preference <a href="#">telux::tel::SuppServicesStatus</a> .
in	<i>callback</i>	- Callback function to get the response of setCallWaitingPref

#### Returns

Status of setCallWaitingPref i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.44.1.4.2.3 virtual telux::common::Status telux::tel::ISuppServicesManager::requestCallWaitingPref ( GetCallWaitingPrefCb *callback* ) [pure virtual]**

This API queries the preference for call waiting.

#### Parameters

in	<i>callback</i>	- Callback function to get the response of requestCallWaitingPref.
----	-----------------	--

#### Returns

Status of requestCallWaitingPref i.e. success or suitable error code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.44.1.4.2.4 virtual telux::common::Status telux::tel::ISuppServicesManager::setForwardingPref ( ForwardReq *forwardReq*, SetSuppSvcPrefCallback *callback = nullptr* ) [pure virtual]**

To set call forwarding preference.

On platforms with Access control enabled, Caller needs to have TELUX\_TEL\_SUPP\_SERVICES permissions to invoke this API successfully.

in	<i>forwardReq</i>	- Parameters for call forwarding operation. <a href="#">telux::tel::ForwardReq</a>
in	<i>callback</i>	- Callback function to get response of setForwardingPref API.

**Returns**

Status of setForwardingPref i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.44.1.4.2.5 virtual telux::common::Status telux::tel::ISuppServicesManager::requestForwardingPref ( ServiceClass *serviceClass*, ForwardReason *reason*, GetForwardingPrefCb *callback* ) [pure virtual]**

This API queries preference for call forwarding supplementary service. If active, returns for which service classes and call forwarding number it is active. It also returns the provision status of the supplementary service. There is an option to configure for which service class the request is made, if the option is not configured it assumes that the request is made for all service classes.

**Parameters**

in	<i>serviceClass</i>	- Service class <a href="#">telux::tel::ServiceClass</a> .
in	<i>callback</i>	- Callback function to get the response of request call forwarding preference.

**Returns**

Status of requestForwardingPref i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**5.44.1.4.2.6 virtual telux::common::Status telux::tel::ISuppServicesManager::setOirPref ( ServiceClass *serviceClass*, SuppServicesStatus *suppSvcStatus*, SetSuppSvcPrefCallback *callback* = *nullptr* ) [pure virtual]**

Activate/Deactivate originating identification restriction preference on the device. If the OIR service was activated, the original call number will be restricted to the target when a call is dialed to a subscriber.

On platforms with access control enabled, the caller must have TELUX\_TEL\_SUPP\_SERVICES permissions to invoke this API successfully.

in	<i>serviceClass</i>	- Service class <a href="#">telux::tel::ServiceClass</a> .
in	<i>suppSvcStatus</i>	- OIR Status <a href="#">telux::tel::SuppServicesStatus</a> .
in	<i>callback</i>	- Callback function to get the response of setOIRPref

**Returns**

Status of setOirPref i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.44.1.4.2.7 **virtual telux::common::Status telux::tel::ISuppServicesManager::requestOirPref ( ServiceClass *serviceClass*, GetOirPrefCb *callback* ) [pure virtual]**

This API queries the originating identification restriction preference.

On platforms with access control enabled, the caller must have TELUX\_TEL\_SUPP\_SERVICES permissions to invoke this API successfully.

**Parameters**

in	<i>serviceClass</i>	- Service class <a href="#">telux::tel::ServiceClass</a> .
in	<i>callback</i>	- Callback function to get the response of requestOIRPref

**Returns**

Status of requestOirPref i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

#### 5.44.1.4.2.8 **virtual telux::common::Status telux::tel::ISuppServicesManager::registerListener ( std::weak\_ptr< ISuppServicesListener > *listener* ) [pure virtual]**

Register a listener for supplementary services events.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ISuppServicesListener</a> object that processes the notification.
----	-----------------	--

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**Returns**

Status of registerListener i.e. success or suitable status code.

#### 5.44.1.4.2.9 virtual telux::common::Status telux::tel::ISuppServicesManager::removeListener ( std::weak\_ptr< ISuppServicesListener > *listener* ) [pure virtual]

Remove a previously added listener.

**Parameters**

in	<i>listener</i>	Pointer to <a href="#">ISuppServicesListener</a> object that needs to be removed.
----	-----------------	---

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**Returns**

Status of removeListener i.e. success or suitable status code.

## 5.44.2 Enumeration Type Documentation

### 5.44.2.1 enum telux::tel::SuppServicesStatus [strong]

Defines supplementary services status.

**Enumerator**

**UNKNOWN** Supplementary service status unknown  
**ENABLED** Supplementary service is enabled  
**DISABLED** Supplementary service is disabled

### 5.44.2.2 enum telux::tel::SuppSvcProvisionStatus [strong]

Defines supplementary services provision status.

**Enumerator**

**UNKNOWN** Supplementary service provision status unknown  
**NOT\_PROVISIONED** Supplementary service is not provisioned  
**PROVISIONED** Supplementary service is provisioned  
**PRESENTATION\_RESTRICTED** Supplementary service is presentation restricted  
**PRESENTATION\_ALLOWED** Supplementary service is presentation allowed

### 5.44.2.3 enum telux::tel::ForwardOperation [strong]

Defines call forwarding operation.

#### Enumerator

**UNKNOWN** Status unknown  
**ACTIVATE** To activate call forwarding  
**DEACTIVATE** To deactivate call forwarding  
**REGISTER** To register for call forwarding  
**ERASE** To erase the previous registration

### 5.44.2.4 enum telux::tel::ForwardReason [strong]

Defines reasons for call forwarding.

#### Enumerator

**UNCONDITIONAL** Unconditional call forwarding  
**BUSY** Forward when the device is busy on another call  
**NOREPLY** Forward when there is no reply  
**NOT\_REACHABLE** Forward when the device is unreachable  
**NOT\_LOGGED\_IN** Forward when the device is not logged in

### 5.44.2.5 enum telux::tel::ServiceClassType [strong]

Defines service class for telephony

#### Enumerator

**NONE** Service class not provided  
**VOICE** Service class voice

### 5.44.2.6 enum telux::tel::FailureCause [strong]

Represents the cause for supplementary services failure.

#### Enumerator

## 5.45 cv2x

- [C APIs](#)
- [CPP APIs](#)

This section contains APIs related to Cellular-V2X operation. The SDK has C and C++ APIs. The C APIs are legacy and are being maintained for backwards compatibility purposes. These APIs are mostly wrappers over the C++ APIs. New features and functionality will be added to C++ APIs. For anyone writing new Cv2x software, it is recommended to use the C++ APIs.

# 6 Namespace Documentation

---

## 6.1 telux Namespace Reference

DeviceConfig provides utility functions to get device configuration details such as multi SIM support.

### Namespaces

- [audio](#)
- [common](#)
- [config](#)
- [cv2x](#)
- [data](#)
- [loc](#)
- [platform](#)
- [power](#)
- [sensor](#)
- [tel](#)
- [therm](#)

DeviceConfig provides utility functions to get device configuration details such as multi SIM support.

Cv2x Rx packets helper class - Help to parse the received packets' meta data at the beginning of the payload, any applications that have enabled the received packets' meta data should use this helper class before using the real payload.

## 6.2 telux::audio Namespace Reference

### Data Structures

- struct [AmrwbpParams](#)
- class [AudioFactory](#)  
*AudioFactory allows creation of audio manager. [More...](#)*
- struct [ChannelVolume](#)
- struct [DtmfTone](#)

- struct [FormatInfo](#)
- struct [FormatParams](#)
- class [IAudioBuffer](#)

*Stream Buffer manages the buffer to be used for read and write operations on Audio Streams. For write operations, applications should request a stream buffer, populate it with the data and then pass it to the write operation and set the dataSize that is to be written to the stream. Similarly for read operations, the application should request a stream buffer and use that in the read operation. At the end of the read, the stream buffer will contain the data read. Once an operation (read/write) has completed, the stream buffer could be reused for a subsequent read/write operation, provided [reset\(\)](#) API called on stream buffer between subsequent calls. [More...](#)*

- class [IAudioCaptureStream](#)

*[IAudioCaptureStream](#) represents single audio capture stream. [More...](#)*

- class [IAudioDevice](#)

*Audio device and it's characteristics like Direction (Sink or Source), type. [More...](#)*

- class [IAudioListener](#)

- class [IAudioLoopbackStream](#)

*[IAudioLoopbackStream](#) represents audio loopback stream. [More...](#)*

- class [IAudioManager](#)

*Audio Manager is a primary interface for audio operations. It provide APIs to manage Streams ( like voice, play, record etc) and sound cards. [More...](#)*

- class [IAudioPlayStream](#)

*[IAudioPlayStream](#) represents single audio playback stream. [More...](#)*

- class [IAudioStream](#)

*[IAudioStream](#) represents single audio stream with base properties. [More...](#)*

- class [IAudioToneGeneratorStream](#)

*[IAudioToneGeneratorStream](#) represents tone generator stream. [More...](#)*

- class [IAudioVoiceStream](#)

*[IAudioVoiceStream](#) represents single voice stream. [More...](#)*

- class [IPlayListener](#)

- class [IStreamBuffer](#)

- class [ITranscodeListener](#)

- class [ITranscoder](#)

*[ITranscoder](#) is used to convert one audio format to another audio format using the transcoding operation. [More...](#)*

- class [IVoiceListener](#)

*Listener class for getting notifications related to DTMF tone detection. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe. [More...](#)*

- struct [StreamBuffer](#)
- struct [StreamConfig](#)
- struct [StreamMute](#)
- struct [StreamVolume](#)

## 6.2.1 Variable Documentation

### 6.2.1.1 `const uint16_t telux::audio::INFINITE_DTMF_DURATION = 0xFFFF`

Duration to play DTMF tone for infinite time

### 6.2.1.2 `const uint16_t telux::audio::INFINITE_TONE_DURATION = 0xFFFF`

## 6.3 telux::common Namespace Reference

### Data Structures

- class [DeviceConfig](#)
- class [ICommandCallback](#)
- class [ICommandResponseCallback](#)

*General command response callback for most of the requests, client needs to implement this interface to get single shot response. [More...](#)*

- class [IServiceStatusListener](#)
- class [Log](#)
- struct [SdkVersion](#)
- class [Version](#)

*Provides version of SDK. [More...](#)*

## 6.3.1 Typedef Documentation

### 6.3.1.1 `using telux::common::ResponseCallback = typedef std::function<void(telux↔ ::common::ErrorCode errorCode)>`

General response callback for most of the requests, client needs to implement this function to get the asynchronous response.

The methods in callback can be invoked from multiple different threads. The implementation should be thread safe.

### Parameters

<code>in</code>	<code>errorCode</code>	<a href="#">ErrorCode</a>
-----------------	------------------------	---------------------------

### 6.3.1.2 using telux::common::InitResponseCb = typedef std::function<void(telux← ::common::ServiceStatus status)>

This API is invoked when the initialization of an object completes.

#### Parameters

in	status	- Service status
----	--------	------------------

## 6.4 telux::config Namespace Reference

### Data Structures

- class [ConfigFactory](#)  
*ConfigFactory allows creation of config related classes. [More...](#)*
- struct [ConfigInfo](#)
- class [IModemConfigListener](#)  
*Listener class for getting notifications related to configuration change detection. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe. [More...](#)*
- class [IModemConfigManager](#)  
*IModemConfigManager provides interface to list config files present in modem's storage. load a new config file in modem, activate a config file, get active config file information, deactivate a config file, delete config file from the modem's storage, get and set mode of config auto selection, register and deregister listener for config update in modem. The config files are also referred to as MBNs. [More...](#)*

## 6.5 telux::cv2x Namespace Reference

### Data Structures

- struct [ConfigEventInfo](#)
- class [Cv2xFactory](#)  
*Cv2xFactory is the factory that creates the Cv2x Radio. [More...](#)*
- struct [Cv2xPoolStatus](#)
- struct [Cv2xRadioCapabilities](#)
- class [Cv2xRxMetaDataHelper](#)
- struct [Cv2xStatus](#)
- struct [Cv2xStatusEx](#)
- class [Cv2xUtil](#)
- struct [DataSessionSettings](#)

- struct [EventFlowInfo](#)
- struct [GlobalIPUnicastRoutingInfo](#)
- class [ICv2xConfig](#)
  - Cv2xConfig provide operations to update or request cv2x configuration. [More...](#)*
- class [ICv2xConfigListener](#)
  - Listeners for ICv2xConfig must implement this interface. [More...](#)*
- class [ICv2xListener](#)
  - Cv2x Radio Manager listeners implement this interface.*
- class [ICv2xRadio](#)
- class [ICv2xRadioListener](#)
  - Listeners for Cv2xRadio must implement this interface. [More...](#)*
- class [ICv2xRadioManager](#)
  - Cv2xRadioManager manages instances of Cv2xRadio. [More...](#)*
- class [ICv2xRxSubscription](#)
- class [ICv2xThrottleManager](#)
  - ThrottleManager provides throttle manager client interface. [More...](#)*
- class [ICv2xThrottleManagerListener](#)
  - Listener class for getting filter rate update notification. [More...](#)*
- class [ICv2xTxFlow](#)
- class [ICv2xTxRxSocket](#)
- class [ICv2xTxStatusReportListener](#)
  - Listeners for CV2X Tx status report must implement this interface. [More...](#)*
- struct [IPv6Address](#)
- struct [IPv6AddrType](#)
- struct [L2FilterInfo](#)
- struct [MacDetails](#)
- struct [RFTxInfo](#)
- struct [RxPacketMetaDataReport](#)
- struct [SlssRxInfo](#)
- struct [SocketInfo](#)
- struct [SpsFlowInfo](#)

- struct [SyncRefUeInfo](#)
- struct [TrustedUEInfo](#)

- struct [TrustedUEInfoList](#)
- struct [TxPoolIdInfo](#)
- struct [TxStatusReport](#)

## 6.5.1 Typedef Documentation

**6.5.1.1 using telux::cv2x::CreateRxSubscriptionCallback = typedef std::function<void (std::shared\_ptr<ICv2xRxSubscription> rxSub, telux::common::ErrorCode error)>**

This function is called as a response to createRxSubscription.

### Parameters

in	<i>rxSub</i>	- Rx Subscription
in	<i>error</i>	- Indicates whether socket creation succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

**6.5.1.2 using telux::cv2x::CreateTxSpsFlowCallback = typedef std::function<void (std::shared\_ptr<ICv2xTxFlow> txSpsFlow, std::shared\_ptr<ICv2xTxFlow> txEventFlow, telux::common::ErrorCode spsError, telux::common::ErrorCode eventError)>**

This function is called as a response to createTxSpsFlow

### Parameters

in	<i>spsFlow</i>	- Sps flow
in	<i>eventFlow</i>	- Optional event flow. Will be nullptr if event flow was not specified in the request
in	<i>error</i>	- Indicates whether Tx SPS flow creation succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>
in	<i>error</i>	- Indicates whether optional Tx Event flow creation succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> </ul>

**6.5.1.3 using telux::cv2x::CreateTxEventFlowCallback = typedef std::function<void (std::shared\_ptr<ICv2xTxFlow> txEventFlow, telux::common::ErrorCode error)>**

This function is called with the response to createTxEventFlow

in	<i>txEventFlow</i>	- Event flow
in	<i>error</i>	- Indicates whether Tx event flow creation succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

#### 6.5.1.4 using `telux::cv2x::CloseTxFlowCallback = typedef std::function<void (std::shared_ptr<ICv2xTxFlow> txFlow, telux::common::ErrorCode error)>`

This function is called with the response to closeTxFlow.

##### Parameters

in	<i>txFlow</i>	- Closed tx flow
in	<i>error</i>	- Indicates whether close operation succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

#### 6.5.1.5 using `telux::cv2x::CloseRxSubscriptionCallback = typedef std::function<void (std::shared_ptr<ICv2xRxSubscription> rxSub, telux::common::ErrorCode error)>`

This function is called with the response to closeRxSubscription.

##### Parameters

in	<i>rxSub</i>	- Closed rx subscription
in	<i>error</i>	- Indicates whether Rx subscription close succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

#### 6.5.1.6 using `telux::cv2x::ChangeSpsFlowInfoCallback = typedef std::function<void (std::shared_ptr<ICv2xTxFlow> txFlow, telux::common::ErrorCode error)>`

This function is called with the response to changeSpsFlowInfo.

##### Parameters

in	<i>txFlow</i>	- Sps flow that requested reservation change
in	<i>error</i>	- SUCCESS if Tx reservation change succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

**6.5.1.7 using telux::cv2x::RequestSpsFlowInfoCallback = typedef std::function<void (std::shared\_ptr<ICv2xTxFlow> txFlow, const SpsFlowInfo & spsInfo, telux::common::ErrorCode error)>**

This function is called with the response to requestSpsFlowInfo.

#### Parameters

in	<i>txFlow</i>	- SPS flow that requested info
in	<i>spsInfo</i>	- SPS flow reservation info
in	<i>error</i>	- SUCCESS if Tx reservation change succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

**6.5.1.8 using telux::cv2x::ChangeEventFlowInfoCallback = typedef std::function<void (std::shared\_ptr<ICv2xTxFlow> txFlow, telux::common::ErrorCode error)>**

This function is called with the response to changeEventFlowInfo.

#### Parameters

in	<i>txFlow</i>	- Event flow that requested reservation change
in	<i>error</i>	- SUCCESS if Tx parameter change succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

**6.5.1.9 using telux::cv2x::RequestCapabilitiesCallback = typedef std::function<void(const Cv2xRadioCapabilities & capabilities, telux::common::ErrorCode error)>**

This function is called with the response to requestCapabilities.

#### Parameters

in	<i>capabilities</i>	- Capability info
in	<i>error</i>	- SUCCESS if capabilities request succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

**6.5.1.10 using telux::cv2x::RequestDataSessionSettingsCallback = typedef std::function<void (const DataSessionSettings & settings, telux::common::←  
ErrorCode error)>**

This function is called with the response to requestDataSessionSettings.

in	<i>settings</i>	- Data session settings
in	<i>error</i>	- SUCCESS if data session settings request succeeded • SUCCESS • GENERIC_FAILURE

#### 6.5.1.11 using telux::cv2x::UpdateTrustedUEListCallback = typedef std::function<void(telux::common::ErrorCode error)>

This function is called with the response to updateTrustedUEList.

##### Parameters

in	<i>error</i>	- SUCCESS if update succeeded • INVALID_ARGUMENTS if trustedUEs or maliciousIds length greater than maximum value • SUCCESS • GENERIC_FAILURE • INVALID_ARGUMENTS
----	--------------	---

#### 6.5.1.12 using telux::cv2x::UpdateSrcL2InfoCallback = typedef std::function<void(telux::common::ErrorCode error)>

This function is called with the response to updateSrcL2Info.

##### Parameters

in	<i>error</i>	- SUCCESS if Tx reservation change succeeded • SUCCESS • GENERIC_FAILURE
----	--------------	--

#### 6.5.1.13 using telux::cv2x::CreateTcpSocketCallback = typedef std::function<void(std::shared\_ptr<ICv2xTxRxSocket> sock, telux::common::ErrorCode error)>

This function is called with the response to createCv2xTcpSocket.

##### Parameters

in	<i>sock</i>	- TCP socket
in	<i>error</i>	- Indicates whether TCP socket creation succeeded • SUCCESS • GENERIC_FAILURE

**6.5.1.14 using telux::cv2x::CloseTcpSocketCallback = typedef std::function<void (std::shared\_ptr<ICv2xTxRxSocket> sock, telux::common::ErrorCode error)>**

This function is called with the response to closeCv2xTcpSocket.

#### Parameters

in	<i>sock</i>	- Closed TCP socket
in	<i>error</i>	- Indicates whether close operation succeeded <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

**6.5.1.15 using telux::cv2x::StartCv2xCallback = typedef std::function<void (telux::common::ErrorCode error)>**

This function is called as a response to startCv2x

#### Parameters

in	<i>error</i>	- SUCCESS if Cv2x mode successfully started <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>
----	--------------	--

**6.5.1.16 using telux::cv2x::StopCv2xCallback = typedef std::function<void (telux::common::ErrorCode error)>**

This function is called as a response to stopCv2x

#### Parameters

in	<i>error</i>	- SUCCESS if Cv2x mode successfully stopped <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>
----	--------------	--

**6.5.1.17 using telux::cv2x::RequestCv2xStatusCallback = typedef std::function<void (Cv2xStatus status, telux::common::ErrorCode error)>**

This function is called as a response to requestCv2xStatus

**Parameters**

in	<i>status</i>	- Cv2x status
in	<i>error</i>	- SUCCESS if Cv2x status was successfully retrieved • SUCCESS • GENERIC_FAILURE

**Deprecated** use RequestCv2xStatusCallbackEx

**6.5.1.18** using telux::cv2x::RequestCv2xStatusCallbackEx = typedef std::function<void (Cv2xStatusEx status, telux::common::ErrorCode error)>

This function is called as a response to requestCv2xStatus

**Parameters**

in	<i>status</i>	- Cv2x status
in	<i>error</i>	- SUCCESS if Cv2x status was successfully retrieved • SUCCESS • GENERIC_FAILURE

**6.5.1.19** using telux::cv2x::UpdateConfigurationCallback = typedef std::function<void (telux::common::ErrorCode error)>

This function is called with the response to updateConfiguration

**Parameters**

in	<i>error</i>	- SUCCESS if configuration was updated successfully • SUCCESS • GENERIC_FAILURE
----	--------------	---

**6.5.1.20** using telux::cv2x::GetSlssRxInfoCallback = typedef std::function<void (const SlssRxInfo& info, telux::common::ErrorCode error)>

This function is called as a response to ICv2xRadioManager::getCv2xSlssRxInfo

**Parameters**

out	<i>info</i>	- Cv2x SLSS Rx Information
out	<i>error</i>	- SUCCESS if Cv2x SLSS Rx Information was successfully retrieved <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• GENERIC_FAILURE</li> </ul>

## 6.6 telux::data Namespace Reference

**Namespaces**

- [net](#)

**Data Structures**

- struct [BandInterferenceConfig](#)
- struct [BitRateInfo](#)
- struct [DataCallEndReason](#)
- union [DataCallEndReason.\\_\\_unnamed\\_\\_](#)

- struct [DataCallStats](#)
- class [DataFactory](#)

*DataFactory* is the central factory to create all data classes. [More...](#)

- class [DataProfile](#)

*DataProfile* class represents single data profile on the modem. [More...](#)

- struct [DataRestrictMode](#)
- struct [DataUsage](#)
- struct [DeviceDataUsage](#)
- struct [EspInfo](#)
- struct [FlowDataRate](#)
- class [IClientListener](#)
- class [IClientManager](#)

*Client Manager* class provides APIs related to devices and clients connected to MDM via different interconnects. A device is any entity with a unique MAC address that is connected to the MDM and clients are characterized by unique IP address. Clients could also be connected over VLANs. Interconnects can be wired (e.g. Ethernet) or wireless (e.g. WLAN). [More...](#)

- struct [IcmpInfo](#)
- class [IDataCall](#)

*Represents single established data call on the device.* [More...](#)

- class [IDataConnectionListener](#)

- class [IDataConnectionManager](#)

*[IDataConnectionManager](#) is a primary interface for cellular connectivity. This interface provides APIs for start and stop data call connections, get data call information and listener for monitoring data calls. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*

- class [IDataCreateProfileCallback](#)

- class [IDataFilterListener](#)

*Listener class for listening to filtering mode notifications, like Data filtering mode change. Client need to implement these methods. The methods in listener can be invoked from multiple threads. So the client needs to make sure that the implementation is thread-safe. [More...](#)*

- class [IDataFilterManager](#)

*[IDataFilterManager](#) class provides interface to enable/disable the data restrict filters and register for data restrict filter. The filtering can be done at any time. One such use case is to do it when we want the AP to suspend so that we are not waking up the AP due to spurious incoming messages. Also to make sure the DataRestrict mode is enabled. [More...](#)*

- class [IDataProfileCallback](#)

- class [IDataProfileListCallback](#)

*Interface for getting list of [DataProfile](#) using callback. Client needs to implement this interface to get single shot responses for commands like get profile list and query profile. [More...](#)*

- class [IDataProfileListener](#)

*Listener class for getting profile change notification. [More...](#)*

- class [IDataProfileManager](#)

- class [IDataSettingsListener](#)

- class [IDataSettingsManager](#)

*Data Settings Manager class provides APIs related to the data subsystem settings. For example, ability to reset current network settings to factory settings, setting backhaul priority, and enabling roaming per PDN. [More...](#)*

- class [IEspFilter](#)

*This class represents a IP Filter for the ESP, get the new instance from [telux::data::DataFactory](#). [More...](#)*

- class [IicmpFilter](#)

*This class represents a IP Filter for the ICMP, get the new instance from [telux::data::DataFactory](#). [More...](#)*

- class [IipFilter](#)

*A IP filter class to add specific filters like what data will be allowed from the modem to the application processor. Only data packets that match the filter will be sent to the apps processor. Also used to configure Firewall rules. [More...](#)*

- struct [IpAddrInfo](#)

- struct [IpFamilyInfo](#)

- struct [IPv4Info](#)

- struct [IPv6Info](#)
- class [IServingSystemListener](#)

*Listener class for data serving system change notification. [More...](#)*
- class [IServingSystemManager](#)

*Serving System Manager class provides APIs related to the serving system for data functionality. For example, ability to query or be notified about the state of the platform's WWAN PS data serving information. [More...](#)*
- class [ITcpFilter](#)

*This class represents a IP Filter for the TCP, get the new instance from [telux::data::DataFactory](#). [More...](#)*
- class [IUDPFilter](#)

*This class represents a IP Filter for the UDP, get the new instance from [telux::data::DataFactory](#). [More...](#)*
- struct [PortInfo](#)
- struct [ProfileParams](#)
- struct [QosFilterRule](#)
- struct [QosIPFlowInfo](#)
- struct [RoamingStatus](#)

*Roaming Status. [More...](#)*
- struct [ServiceStatus](#)

- class [IBridgeManager](#)

*[IBridgeManager](#) provides APIs to enable/disable and set/get/delete software bridges for various WLAN and Ethernet interfaces. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*
- class [IFirewallEntry](#)

*Firewall entry class is used for configuring firewall rules. [More...](#)*

- class [IFirewallListener](#)
- class [IFirewallManager](#)

*FirewallManager is a primary interface that filters and controls the network traffic on a pre-configured set of rules. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*

- class [IL2tpListener](#)
- class [IL2tpManager](#)

*L2tpManager is a primary interface for configuring L2TP Service. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*

- class [INatListener](#)
- class [INatManager](#)

*NatManager is a primary interface for configuring static network address translation(SNAT) and DMZ (demilitarized zone). It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*

- class [ISocksListener](#)
- class [ISocksManager](#)

*SocksManager is a primary interface for configuring legacy Socks proxy server. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*

- class [IVlanListener](#)
- class [IVlanManager](#)

*VlanManager is a primary interface for configuring VLAN (Virtual Local Area Network). it provide APIs for create, query, remove VLAN interfaces and associate or disassociate with profile IDs. It also provides interface to Subsystem Restart events by registering as listener. Notifications will be received when modem is ready/not ready. [More...](#)*

- struct [L2tpSessionConfig](#)
- struct [L2tpSysConfig](#)
- struct [L2tpTunnelConfig](#)
- struct [NatConfig](#)

## 6.8 telux::loc Namespace Reference

## Data Structures

- struct [BodyToSensorMountParams](#)
- struct [DREngineConfiguration](#)
- struct [GlonassTimeInfo](#)
- struct [GnssData](#)
- struct [GnssEnergyConsumedInfo](#)
- struct [GnssKinematicsData](#)
- struct [GnssMeasurementInfo](#)
- struct [GnssMeasurements](#)
- struct [GnssMeasurementsClock](#)
- struct [GnssMeasurementsData](#)
- class [IDgnssManager](#)

*IRtcManager provides interface to inject RTCM data into modem, register event listener reported by cdfw(correction data framework). [More...](#)*
- class [IDgnssStatusListener](#)

*Listener class for getting RTCM injection event notification information. [More...](#)*
- class [IGnssSignalInfo](#)

*IGnssSignalInfo provides interface to retrieve GNSS data information like jammer metrics and automatic gain control for satellite signal type. [More...](#)*
- class [IGnssSVInfo](#)

*IGnssSVInfo provides interface to retrieve the list of SV info available and whether altitude is assumed or calculated. [More...](#)*
- class [ILocationConfigListener](#)

*ILocationConfigListener interface is used to receive notifications related to configuration events. [More...](#)*
- class [ILocationConfigurator](#)

*ILocationConfigurator allows general engine configurations (example: TUNC, PACE etc), configuration of specific engines like SPE (example: minSVElevation, minGPSWeek etc) or DRE, deletion of warm and cold aiding data, NMEA configuration and support for XTRA feature. [ILocationConfigurator](#) APIs strictly adheres to the principle of single client per process. [More...](#)*
- class [ILocationInfoBase](#)

*ILocationInfoBase provides interface to get basic position related information like latitude, longitude, altitude, timestamp. [More...](#)*
- class [ILocationInfoEx](#)

*ILocationInfoEx provides interface to get richer position related information like latitude, longitude, altitude and other information like time stamp, session status, dop, reliabilities, uncertainties etc. [More...](#)*
- class [ILocationListener](#)

*Listener class for getting location updates and satellite vehicle information. [More...](#)*

- class [ILocationManager](#)

*ILocationManager* provides interface to register and remove listeners. It also allows to set and get configuration/ criteria for position reports. The new APIs(*registerListenerEx*, *deRegisterListenerEx*, *startDetailedReports*, *startBasicReports*) and old/deprecated APIs(*registerListener*, *removeListener*, *setPositionReportTimeout*, *setHorizontalAccuracyLevel*, *setMinIntervalForReports*) should not be used interchangeably, either the new APIs should be used or the old APIs should be used. [More...](#)

- class [ILocationSystemInfoListener](#)

- class [ISVInfo](#)

*ISVInfo* provides interface to retrieve information about Satellite Vehicles, their position and health status. [More...](#)

- struct [LeapSecondChangeInfo](#)

- struct [LeapSecondInfo](#)

- struct [LeverArmParams](#)

- struct [LLAInfo](#)

- class [LocationFactory](#)

*LocationFactory* allows creation of location manager. [More...](#)

- struct [LocationSystemInfo](#)

- struct [NmeaConfig](#)

- struct [RobustLocationConfiguration](#)

- struct [RobustLocationVersion](#)

- struct [SvBlackListInfo](#)

- struct [SvUsedInPosition](#)

- struct [SystemTime](#)

- union [SystemTimeInfo](#)

- struct [TimeInfo](#)

- struct [XtraConfig](#)

- struct [XtraStatus](#)

## 6.9 telux::platform Namespace Reference

### Data Structures

- struct [EfsEventInfo](#)

- class [IFsListener](#)

*Listener* class for getting notifications related to EFS backup/restore operations. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe. [More...](#)

- class [IFsManager](#)

*IFsManager* provides interface to to control and get notified about file system operations. This includes Embedded file system (EFS) operations. [More...](#)

- class [PlatformFactory](#)

*PlatformFactory* allows creation of Platform services related classes. [More...](#)

## 6.10 telux::power Namespace Reference

### Data Structures

- class [ITcuActivityListener](#)

*Listener* class for getting notifications related to TCU-activity state and also the updates related to TCU-activity service status. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe. [More...](#)

- class [ITcuActivityManager](#)

*ITcuActivityManager* provides interface to register and de-register listeners to get TCU-activity state updates. And also API to initiate TCU-activity state transition. The system can be configured to be operated in ACTIVE or PASSIVE mode with respect to TcuActivity management. In ACTIVE mode, the TCU-activity management service leads the system into desired activity state after receiving the acknowledgements from all the clients or after the configured timeout. In PASSIVE mode, the management service just notifies the clients about the state transition and conveys their acknowledgement status back to the Master application that triggered the state transition. [More...](#)

- class [PowerFactory](#)

*PowerFactory* allows creation of TCU-activity manager instance. [More...](#)

## 6.11 telux::sensor Namespace Reference

### Data Structures

- class [ISensor](#)

*ISensor* interface is used to access the different services provided by the sensor to configure, activate and get sensor data. [More...](#)

- class [ISensorEventListener](#)

*ISensorEventListener* interface is used to receive notifications related to sensor events and configuration updates. [More...](#)

- class [ISensorFeatureEventListener](#)

*ISensorFeatureEventListener* interface is used to receive notifications related to sensor feature events. [More...](#)

- class [ISensorFeatureManager](#)

*Sensor Feature Manager* class provides APIs to interact with the sensor framework to list the available features, enable them or disable them. The availability of sensor features depends on the capabilities of the underlying hardware. [More...](#)

- class [ISensorManager](#)

*Sensor Manager class provides APIs to interact with the sensor sub-system and get access to other sensor objects which can be used to configure, activate or get data from the individual sensors available - Gyro, Accelerometer, etc. [More...](#)*
- struct [MotionSensorData](#)

*Structure of a single sample from a motion sensor. [More...](#)*
- struct [SensorConfiguration](#)

*Configurable parameters of a sensor. [More...](#)*
- struct [SensorEvent](#)

*Structure of a single sensor event. [More...](#)*
- union [SensorEvent.\\_\\_unnamed\\_\\_](#)
- class [SensorFactory](#)

*SensorFactory is the central factory to create instances of sensor objects. [More...](#)*
- struct [SensorFeature](#)

*Feature offered by sensor hardware and/or software framework. [More...](#)*
- struct [SensorFeatureEvent](#)

*Structure of an event that is generated from a sensor feature. [More...](#)*
- struct [SensorInfo](#)

*Information related to sensor. [More...](#)*
- struct [UncalibratedMotionSensorData](#)

*Structure of a single sample from uncalibrated motion sensor. [More...](#)*

## 6.12 telux::tel Namespace Reference

### Data Structures

- struct [CardReaderStatus](#)
- class [CdmaCellIdentity](#)
- class [CdmaCellInfo](#)
- class [CdmaSignalStrengthInfo](#)
- struct [CellBroadcastFilter](#)
- class [CellBroadcastMessage](#)

*Cell Broadcast message. [More...](#)*
- class [CellInfo](#)
- struct [CellularCapabilityInfo](#)
- class [Circle](#)

- class [CmasInfo](#)
- struct [CustomHeader](#)
- struct [DcStatus](#)
- struct [DeleteInfo](#)
  - *Specify delete information used for deleting message on storage. [More...](#)*
- struct [EcallConfig](#)
- struct [ECallHlapTimerEvents](#)
- struct [ECallHlapTimerStatus](#)
- struct [ECallModeInfo](#)
- struct [ECallMsdControlBits](#)
- struct [ECallMsdData](#)
- struct [ECallMsdOptionals](#)
- struct [ECallOptionalPdu](#)
- struct [ECallVehicleIdentificationNumber](#)
- struct [ECallVehicleLocation](#)
- struct [ECallVehicleLocationDelta](#)
- struct [ECallVehiclePropulsionStorageType](#)
- class [EtwsInfo](#)
- struct [ForwardInfo](#)
- struct [ForwardReq](#)
- class [Geometry](#)
- class [GsmCellIdentity](#)
- class [GsmCellInfo](#)
- class [GsmSignalStrengthInfo](#)
- class [IAtrResponseCallback](#)
- class [ICall](#)
  - *[ICall](#) represents a call in progress. An [ICall](#) cannot be directly created by the client, rather it is returned as a result of instantiating a call or from the [PhoneListener](#) when receiving an incoming call. [More...](#)*
- class [ICallListener](#)
  - *A listener class for monitoring changes in call, including call state change and [ECall](#) state change. Override the methods for the state that you wish to receive updates for. [More...](#)*
- class [ICallManager](#)
  - *Call Manager is the primary interface for call related operations Allows to conference calls, swap calls, make normal voice call and emergency call, send and update MSD pdu. [More...](#)*
- class [ICard](#)

*ICard* represents currently inserted UICC or eUICC. [More...](#)

- class [ICardApp](#)

*Represents a single card application. [More...](#)*

- class [ICardChannelCallback](#)
- class [ICardCommandCallback](#)
- class [ICardListener](#)
- class [ICardManager](#)
- class [ICardReaderCallback](#)
- struct [IccResult](#)
- class [ICellBroadcastListener](#)

*A listener class which monitors cell broadcast messages. [More...](#)*

- class [ICellBroadcastManager](#)

*CellBroadcastManager class is primary interface to configure and activate emergency broadcast messages and receive broadcast messages. [More...](#)*

- class [ICellularCapabilityCallback](#)

- class [IHttpTransactionListener](#)

*The interface listens for indication to perform HTTP request and send back the response for HTTP request to modem. [More...](#)*

- class [IHttpTransactionManager](#)

*IHttpTransactionManager is the interface to service HTTP related requests from the modem for SIM profile update related operations. [More...](#)*

- class [IimsServingSystemListener](#)

*A listener class for monitoring changes in IMS Serving System manager, including IMS registration status change. Override the methods for the state that you wish to receive updates for.*

- class [IimsServingSystemManager](#)

*IMS Serving System Manager is the primary interface for IMS related operations Allows to query IMS registration status.*

- class [IimsSettingsListener](#)

*Listener class for getting IMS service configuration change notifications. The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe. [More...](#)*

- class [IimsSettingsManager](#)

*ImsSettingsManager allows IMS settings. For example enabling or disabling IMS service, VOIMS service. [More...](#)*

- class [IMakeCallCallback](#)

*Interface for Make Call callback object. Client needs to implement this interface to get single shot responses for commands like make call. [More...](#)*

- struct [ImsRegistrationInfo](#)

- struct [ImsServiceConfig](#)
- class [IMultiSimListener](#)

*Listener class for getting high capability change notification. The listener method can be invoked from multiple different threads. Client needs to make sure that implementation is thread-safe. [More...](#)*
- class [IMultiSimManager](#)

*MultiSimManager allows to perform operation pertaining to devices which have more than one SIM/UICC card. Clients should check if the subsystem is ready before invoking any of the APIs as follows. [More...](#)*
- class [INetworkSelectionListener](#)

*Listener class for getting network selection mode change notification. [More...](#)*
- class [INetworkSelectionManager](#)

*Network Selection Manager class provides the interface to get and set network selection mode, preferred network list and scan available networks. [More...](#)*
- class [IOperatingModeCallback](#)
- class [IPhone](#)

*This class allows getting system information and registering for system events. Each Phone instance is associated with a single SIM. So on a dual SIM device you would have 2 Phone instances. [More...](#)*
- class [IPhoneListener](#)

*A listener class for monitoring changes in specific telephony states on the device, including service state and signal strength. Override the methods for the state that you wish to receive updates for. [More...](#)*
- class [IPhoneManager](#)

*Phone Manager creates one or more phones based on SIM slot count, it allows clients to register for notification of system events. Clients should check if the subsystem is ready before invoking any of the APIs. [More...](#)*
- class [IRemoteSimListener](#)

*A listener class for getting remote SIM notifications. [More...](#)*
- class [IRemoteSimManager](#)

*[IRemoteSimManager](#) provides APIs for remote SIM related operations. This allows a device to use a SIM card on another device for its WWAN modem functionality. The SIM provider service is the endpoint that interfaces with the SIM card (e.g. over bluetooth) and sends/receives data to the other endpoint, the modem. The modem sends requests to the SIM provider service to interact with the SIM card (e.g. power up, transmit APDU, etc.), and is notified of events (e.g. card errors, resets, etc.). This API is used by the SIM provider endpoint to provide a SIM card to the modem. [More...](#)*
- class [ISapCardCommandCallback](#)
- class [ISapCardListener](#)
- class [ISapCardManager](#)

*[ISapCardManager](#) provide APIs for SAP related operations. [More...](#)*
- class [IServingSystemListener](#)

*Listener class for getting radio access technology mode preference change notification. [More...](#)*
- class [IServingSystemManager](#)

*Serving System Manager class provides the API to request and set service domain preference and RAT preference. [More...](#)*

- class [ISignalStrengthCallback](#)

*Interface for Signal strength callback object. Client needs to implement this interface to get single shot responses for commands like get signal strength. [More...](#)*

- class [ISimProfileListener](#)

*The interface listens for profile download indication and keep track of download and install progress of profile. [More...](#)*

- class [ISimProfileManager](#)

*[ISimProfileManager](#) is a primary interface for remote eUICCs (eSIMs or embedded SIMs) provisioning. This interface provides APIs to add, delete, set profile, update nickname, provide user consent, get Eid on the eUICC. [More...](#)*

- class [ISmscAddressCallback](#)

- class [ISmsListener](#)

*A listener class receives notification for the incoming message(s) and delivery report for sent message(s). [More...](#)*

- class [ISmsManager](#)

*SmsManager class is the primary interface to manage SMS operations such as send and receive an SMS text and raw encoded PDU(s). This class handles single part and multi-part messages. [More...](#)*

- class [ISubscription](#)

*Subscription returns information about network operator subscription details pertaining to a SIM card. [More...](#)*

- class [ISubscriptionListener](#)

*A listener class for receiving device subscription information. The methods in listener can be invoked from multiple different threads. The implementation should be thread safe. [More...](#)*

- class [ISubscriptionManager](#)

- class [ISuppServicesListener](#)

*A listener class for receiving supplementary services notifications. The methods in listener can be invoked from multiple different threads. The implementation should be thread safe. [More...](#)*

- class [ISuppServicesManager](#)

*[ISuppServicesManager](#) is the interface to provide supplementary services like call forwarding and call waiting. [More...](#)*

- class [IVoiceServiceStateCallback](#)

*Interface for voice service state callback object. Client needs to implement this interface to get single shot responses for commands like request voice radio technology. [More...](#)*

- class [LteCellIdentity](#)

- class [LteCellInfo](#)

- class [LteSignalStrengthInfo](#)

- struct [MessageAttributes](#)

Contains structure of message attributes like encoding type, number of segments, characters left in last segment. [More...](#)

- struct [MessagePartInfo](#)

Structure containing information about the part of multi-part SMS such as concatenated message reference number, number of segments and segment number. During concatenation this information along with originating address helps in associating each part of the multi-part message to the corresponding multi-part message. [More...](#)

- struct [NetworkScanInfo](#)
- class [Nr5gCellIdentity](#)
- class [Nr5gCellInfo](#)
- class [Nr5gSignalStrengthInfo](#)
- class [OperatorInfo](#)
- struct [OperatorStatus](#)
- class [PhoneFactory](#)

[PhoneFactory](#) is the central factory to create all Telephony SDK Classes and services. [More...](#)

- struct [Point](#)
- class [Polygon](#)
- struct [PreferredNetworkInfo](#)
- struct [ServingSystemInfo](#)
- class [SignalStrength](#)
- class [SimProfile](#)

[SimProfile](#) class represents single eUICC profile on the card. [More...](#)

- struct [SimRatCapability](#)
- struct [SlotStatus](#)
- class [SmsMessage](#)

Data structure represents an incoming SMS. This is applicable for single part message or part of the multipart message. [More...](#)

- struct [SmsMetaInfo](#)

Provides certain attributes of an SMS message. [More...](#)

- class [TdscdmaCellIdentity](#)
- class [TdscdmaCellInfo](#)
- class [TdscdmaSignalStrengthInfo](#)
- class [VoiceServiceInfo](#)
- class [WarningAreaInfo](#)
- class [WcdmaCellIdentity](#)
- class [WcdmaCellInfo](#)

- class [WcdmaSignalStrengthInfo](#)

## 6.12.1 Data Structure Documentation

### 6.12.1.1 struct telux::tel::ImsRegistrationInfo

Defines the IMS registration status parameters and the error code value

#### Data fields

Type	Field	Description
<a href="#">Registration↔ Status</a>	imsRegStatus	The status of the IMS registration with the network
int	errorCode	An error code is returned when the IMS registration status is <a href="#">RegistrationStatus::NOT_REGISTERED</a> . Values(Defined in SIP-RFC3261 section 13.2.2.2 and section 13.2.2.3): <ul style="list-style-type: none"> <li>• 3xx – Redirection responses</li> <li>• 4xx – Client failure responses</li> <li>• 5xx – Server failure responses</li> <li>• 6xx – Global failure responses</li> </ul>
string	errorString	Registration failure error string when the IMS is not registered.

## 6.12.2 Typedef Documentation

### 6.12.2.1 using telux::tel::ImsRegistrationInfoCb = typedef std::function<void(Ims↔ RegistrationInfo status, telux::common::ErrorCode error)>

This function is called in the response to requestRegistrationInfo API.

The callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Parameters

in	<i>status</i>	Indicates the IMS registration status and the error code <a href="#">telux::tel::ImsRegistrationInfo</a> .
in	<i>error</i>	Return code which indicates whether the operation succeeded or not <a href="#">telux::common::ErrorCode</a> .

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 6.12.2.2 using telux::tel::RatMask = typedef std::bitset<16>

16 bit mask that denotes which of the radio access technologies defined in RatType enum are used for preferred networks.

### 6.12.2.3 using telux::tel::SelectionModeResponseCallback = typedef std↔ ::function<void(NetworkSelectionMode mode, telux::common::ErrorCode error)>

This function is called with the response to requestNetworkSelectionMode API.

The callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Parameters

in	<i>mode</i>	<a href="#">NetworkSelectionMode</a>
in	<i>error</i>	Return code which indicates whether the operation succeeded or not ErrorCode

### 6.12.2.4 using telux::tel::PreferredNetworksCallback = typedef std↔::function<void(std↔ ::vector<PreferredNetworkInfo> info, std↔::vector<PreferredNetworkInfo> staticInfo, telux::common::ErrorCode error)>

This function is called with the response to requestPreferredNetworks API.

The callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Parameters

in	<i>info</i>	3GPP preferred networks list i.e PLMN list.
in	<i>staticInfo</i>	Static 3GPP preferred networks list i.e OPLMN list.
in	<i>error</i>	Return code which indicates whether the operation succeeded or not. ErrorCode

### 6.12.2.5 using telux::tel::NetworkScanCallback = typedef std↔::function<void(std↔ ::vector<OperatorInfo> operatorInfos, telux::common::ErrorCode error)>

This function is called with the response to performNetworkScan API.

The callback can be invoked from multiple different threads. The implementation should be thread safe.

#### Parameters

in	<i>operatorInfos</i>	Operators info with details of network operator name, MCC, MNC and status.
in	<i>error</i>	Return code which indicates whether the operation succeeded or not. ErrorCode

## 6.12.3 Enumeration Type Documentation

### 6.12.3.1 enum telux::tel::RegistrationStatus [strong]

Defines the IMS registration status parameters

#### Enumerator

**UNKOWN\_STATE** Unknown status for IMS  
**NOT\_REGISTERED** Not registered status for IMS  
**REGISTERING** Registering status for IMS  
**REGISTERED** Registered status for IMS  
**LIMITED\_REGISTERED** Limited registration status for IMS

## 6.13 telux::therm Namespace Reference

### Data Structures

- struct [BoundCoolingDevice](#)
- class [ICoolingDevice](#)

*ICoolingDevice* provides interface to get type of the cooling device, the maximum throttle state and the currently requested throttle state of the cooling device. [More...](#)
- class [IThermalListener](#)

*Listener* class for getting notifications when thermal service status changes. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe. [More...](#)
- class [IThermalManager](#)

*IThermalManager* provides interface to get thermal zone and cooling device information. [More...](#)
- class [IThermalShutdownListener](#)

*Listener* class for getting notifications when automatic thermal shutdown mode is enabled/ disabled or will be enabled imminently. The client needs to implement these methods as briefly as possible and avoid blocking calls in it. The methods in this class can be invoked from multiple different threads. Client needs to make sure that the implementation is thread-safe. [More...](#)
- class [IThermalShutdownManager](#)

*IThermalShutdownManager* class provides interface to enable/disable automatic thermal shutdown. Additionally it facilitates to register for notifications when the automatic shutdown mode changes. [More...](#)
- class [IThermalZone](#)

*IThermalZone* provides interface to get type of the sensor, the current temperature reading, trip points and the cooling devices binded etc. [More...](#)
- class [ITripPoint](#)

*ITripPoint* provides interface to get trip point type, trip point temperature and hysteresis value for that trip point. [More...](#)
- class [ThermalFactory](#)

*ThermalFactory* allows creation of thermal manager. [More...](#)

# 7 Data Structure Documentation

---

## 7.1 telux::cv2x::ICv2xListener Class Reference

Cv2x Radio Manager listeners implement this interface.

### Public member functions

- virtual void [onStatusChanged](#) (Cv2xStatus status)
- virtual void [onStatusChanged](#) (Cv2xStatusEx status)
- virtual void [onSlssRxInfoChanged](#) (const SlssRxInfo &slssInfo)
- virtual [~ICv2xListener](#) ()

Cv2x Radio Manager listeners implement this interface.

### 7.1.1 Constructors and Destructors

#### 7.1.1.1 virtual telux::cv2x::ICv2xListener::~~ICv2xListener ( ) [virtual]

Destructor for [ICv2xListener](#)

### 7.1.2 Member Function Documentation

#### 7.1.2.1 virtual void telux::cv2x::ICv2xListener::onStatusChanged ( Cv2xStatus *status* ) [virtual]

Called when the status of the CV2X radio has changed.

#### Parameters

in	<i>status</i>	- CV2X radio status.
----	---------------	----------------------

**Deprecated** use [onStatusChanged\(Cv2xStatusEx status\)](#)

#### 7.1.2.2 virtual void telux::cv2x::ICv2xListener::onStatusChanged ( Cv2xStatusEx *status* ) [virtual]

Called when the status of the CV2X radio has changed.

<i>in</i>	<i>status</i>	- CV2X radio status.
-----------	---------------	----------------------

### 7.1.2.3 virtual void telux::cv2x::ICv2xListener::onSlssRxInfoChanged ( const SlssRxInfo & *slssInfo* ) [virtual]

Called when CV2X SLSS Rx is enabled and any of below events has occurred:

- A new SLSS sync reference UE is detected, lost, or selected as the timing source, report the present sync reference UEs.
- UE timing source switches from SLSS to GNSS, report 0 sync reference UE.
- SLSS Rx is disabled, report 0 sync reference UE.
- Cv2x is stopped, report 0 sync reference UE.

#### Parameters

<i>in</i>	<i>info</i>	- CV2X SLSS Rx information.
-----------	-------------	-----------------------------

## 7.2 telux::tel::IImServingSystemListener Class Reference

A listener class for monitoring changes in IMS Serving System manager, including IMS registration status change. Override the methods for the state that you wish to receive updates for.

### Public member functions

- virtual void [onServiceStatusChange](#) ([telux::common::ServiceStatus](#) status)
- virtual void [onImSRegStatusChange](#) ([ImSRegistrationInfo](#) status)
- virtual [~IImServingSystemListener](#) ()

A listener class for monitoring changes in IMS Serving System manager, including IMS registration status change. Override the methods for the state that you wish to receive updates for.

The methods in listener can be invoked from multiple different threads. The implementation should be thread safe.

### 7.2.1 Constructors and Destructors

#### 7.2.1.1 virtual telux::tel::IImServingSystemListener::~~IImServingSystemListener ( ) [virtual]

### 7.2.2 Member Function Documentation

#### 7.2.2.1 virtual void telux::tel::IImServingSystemListener::onServiceStatusChange ( telux::common::ServiceStatus *status* ) [virtual]

This function is called when service status changes.

in	status	- <a href="#">telux::common::ServiceStatus</a>
----	--------	--

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

Reimplemented from [telux::common::IServiceStatusListener](#).

### 7.2.2.2 virtual void telux::tel::IImServingSystemListener::onImSRegStatusChange ( ImsRegistrationInfo status ) [virtual]

This function is called whenever any IMS service configuration is changed.

**Parameters**

in	status	Indicates which registration status is the IMS service changed to. <a href="#">telux::tel::ImsRegistrationInfo</a> .
----	--------	--

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 7.3 telux::tel::IImServingSystemManager Class Reference

IMS Serving System Manager is the primary interface for IMS related operations Allows to query IMS registration status.

**Public member functions**

- virtual [telux::common::ServiceStatus](#) getServiceStatus ()=0
- virtual [telux::common::Status](#) requestRegistrationInfo (ImsRegistrationInfoCb callback)=0
- virtual [telux::common::Status](#) registerListener (std::weak\_ptr< [telux::tel::IImServingSystemListener](#) > listener)=0
- virtual [telux::common::Status](#) deregisterListener (std::weak\_ptr< [telux::tel::IImServingSystemListener](#) > listener)=0
- virtual [~IImServingSystemManager](#) ()

IMS Serving System Manager is the primary interface for IMS related operations Allows to query IMS registration status.

### 7.3.1 Constructors and Destructors

#### 7.3.1.1 virtual telux::tel::IImServingSystemManager::~~IImServingSystemManager ( ) [virtual]

## 7.3.2 Member Function Documentation

### 7.3.2.1 virtual telux::common::ServiceStatus telux::tel::ImsServingSystemManager↔ ::getServiceStatus ( ) [pure virtual]

This status indicates whether the [ImsServingSystemManager](#) object is in a usable state.

#### Returns

SERVICE\_AVAILABLE - If IMS Serving System manager is ready for service.

SERVICE\_UNAVAILABLE - If IMS Serving System manager is temporarily unavailable.

SERVICE\_FAILED - If IMS Serving System manager encountered an irrecoverable failure.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 7.3.2.2 virtual telux::common::Status telux::tel::ImsServingSystemManager↔ ::requestRegistrationInfo ( ImsRegistrationInfoCb callback ) [pure virtual]

Request IMS registration information.

#### Parameters

in	<i>callback</i>	Callback pointer to get the response of requestRegistrationInfo.
----	-----------------	--

#### Returns

Status of requestRegistrationInfo i.e. success or suitable status code.

#### Note

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

### 7.3.2.3 virtual telux::common::Status telux::tel::ImsServingSystemManager↔ ::registerListener ( std::weak\_ptr< telux::tel::ImsServingSystemListener > *listener* ) [pure virtual]

Add a listener to listen for specific events in the IMS Serving System subsystem.

#### Parameters

in	<i>listener</i>	Pointer to <a href="#">ImsServingSystemListener</a> object that processes the notification
----	-----------------	--

**Returns**

Status of registerListener i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

**7.3.2.4 virtual telux::common::Status telux::tel::IImServiceSystemManager↔  
::deregisterListener ( std::weak\_ptr< telux::tel::IImServiceSystemListener >  
listener ) [pure virtual]**

Remove a previously added listener.

**Parameters**

in	<i>listener</i>	Listener to be removed.
----	-----------------	-------------------------

**Returns**

Status of deregisterListener i.e. success or suitable error code.

**Note**

Eval: This is a new API and is being evaluated. It is subject to change and could break backwards compatibility.

## 7.4 telux::common::IImServiceStatusListener Class Reference

**Public member functions**

- virtual void [onServiceStatusChange](#) ([ServiceStatus](#) status)
- virtual [~IImServiceStatusListener](#) ()

### 7.4.1 Constructors and Destructors

**7.4.1.1 virtual telux::common::IImServiceStatusListener::~IImServiceStatusListener ( )  
[virtual]**

### 7.4.2 Member Function Documentation

**7.4.2.1 virtual void telux::common::IImServiceStatusListener::onServiceStatusChange ( [ServiceStatus](#) status ) [virtual]**

This function is called when service status changes.

in	<i>status</i>	- <a href="#">ServiceStatus</a>
----	---------------	---------------------------------

Reimplemented in [telux::tel::IImServingSystemListener](#).

## LEGAL INFORMATION

Your access to and use of this material, along with any documents, software, specifications, reference board files, drawings, diagnostics and other information contained herein (collectively this “Material”), is subject to your (including the corporation or other legal entity you represent, collectively “You” or “Your”) acceptance of the terms and conditions (“Terms of Use”) set forth below. If You do not agree to these Terms of Use, you may not use this Material and shall immediately destroy any copy thereof.

### 1) Legal Notice.

This Material is being made available to You solely for Your internal use with those products and service offerings of Qualcomm Technologies, Inc. (“Qualcomm Technologies”), its affiliates and/or licensors described in this Material, and shall not be used for any other purposes. If this Material is marked as “Qualcomm Internal Use Only”, no license is granted to You herein, and You must immediately (a) destroy or return this Material to Qualcomm Technologies, and (b) report Your receipt of this Material to [qualcomm.support@qti.qualcomm.com](mailto:qualcomm.support@qti.qualcomm.com). This Material may not be altered, edited, or modified in any way without Qualcomm Technologies’ prior written approval, nor may it be used for any machine learning or artificial intelligence development purpose which results, whether directly or indirectly, in the creation or development of an automated device, program, tool, algorithm, process, methodology, product and/or other output. Unauthorized use or disclosure of this Material or the information contained herein is strictly prohibited, and You agree to indemnify Qualcomm Technologies, its affiliates and licensors for any damages or losses suffered by Qualcomm Technologies, its affiliates and/or licensors for any such unauthorized uses or disclosures of this Material, in whole or part.

Qualcomm Technologies, its affiliates and/or licensors retain all rights and ownership in and to this Material. No license to any trademark, patent, copyright, mask work protection right or any other intellectual property right is either granted or implied by this Material or any information disclosed herein, including, but not limited to, any license to make, use, import or sell any product, service or technology offering embodying any of the information in this Material.

THIS MATERIAL IS BEING PROVIDED “AS IS” WITHOUT WARRANTY OF ANY KIND, WHETHER EXPRESSED, IMPLIED, STATUTORY OR OTHERWISE. TO THE MAXIMUM EXTENT PERMITTED BY LAW, QUALCOMM TECHNOLOGIES, ITS AFFILIATES AND/OR LICENSORS SPECIFICALLY DISCLAIM ALL WARRANTIES OF TITLE, MERCHANTABILITY, NON-INFRINGEMENT, FITNESS FOR A PARTICULAR PURPOSE, SATISFACTORY QUALITY, COMPLETENESS OR ACCURACY, AND ALL WARRANTIES ARISING OUT OF TRADE USAGE OR OUT OF A COURSE OF DEALING OR COURSE OF PERFORMANCE. MOREOVER, NEITHER QUALCOMM TECHNOLOGIES, NOR ANY OF ITS AFFILIATES AND/OR LICENSORS, SHALL BE LIABLE TO YOU OR ANY THIRD PARTY FOR ANY EXPENSES, LOSSES, USE, OR ACTIONS HOWSOEVER INCURRED OR UNDERTAKEN BY YOU IN RELIANCE ON THIS MATERIAL.

Certain product kits, tools and other items referenced in this Material may require You to accept additional terms and conditions before accessing or using those items.

Technical data specified in this Material may be subject to U.S. and other applicable export control laws. Transmission contrary to U.S. and any other applicable law is strictly prohibited.

Nothing in this Material is an offer to sell any of the components or devices referenced herein.

This Material is subject to change without further notification.

In the event of a conflict between these Terms of Use and the *Website Terms of Use* on [www.qualcomm.com](http://www.qualcomm.com) or the *Qualcomm Privacy Policy* referenced on [www.qualcomm.com](http://www.qualcomm.com), these Terms of Use will control. In the event of a conflict between these Terms of Use and any other agreement (written or click-through, including, without limitation any non-disclosure agreement) executed by You and Qualcomm Technologies or a Qualcomm Technologies affiliate and/or licensor with respect to Your access to and use of this Material, the other agreement will control.

These Terms of Use shall be governed by and construed and enforced in accordance with the laws of the State of California, excluding the U.N. Convention on International Sale of Goods, without regard to conflict of laws principles. Any dispute, claim or controversy arising out of or relating to these Terms of Use, or the breach or validity hereof, shall be adjudicated only by a court of competent jurisdiction in the county of San Diego, State of California, and You hereby consent to the personal jurisdiction of such courts for that purpose.

### 2) Trademark and Product Attribution Statements.

Qualcomm is a trademark or registered trademark of Qualcomm Incorporated. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the U.S. and/or elsewhere. The Bluetooth® word mark is a registered trademark owned by Bluetooth SIG, Inc.
